HEARINGS

BEFORE THE

COMMITTEE ON FINANCE
UNITED STATES SENATE

ON THE PROPOSED

TARIFF ACT OF 1921

(H. R. 7456)

SCHEDULE 4

WOOD AND MANUFACTURES OF

Revised and Indexed

WASHINGTON
GOVERNMENT PRINTING OFFICE
1922

COMMITTEE ON FINANCE.

BOIES PENROSE, Pennsylvania, *Chairman*.

PORTER J. McCUMBER, North Dakota.
REED SMOOT, Utah.
ROBERT M. LA FOLLETTE, Wisconsin.
WILLIAM P. DILLINGHAM, Vermont.
GEORGE P. McLEAN, Connecticut.
CHARLES CURTIS, Kansas.
JAMES E. WATSON, Indiana.
WILLIAM M. CALDER, New York.
HOWARD SUTHERLAND, West Virginia.
FURNIFOLD M. SIMMONS, North Carolina.
JOHN SHARP WILLIAMS, Mississippi.
ANDRIEUS A. JONES, New Mexico.
PETER G. GERRY, Rhode Island.
JAMES A. REED, Missouri.
DAVID I. WALSH, Massachusetts.

LEIGHTON C. TAYLOR, *Clerk*.
W. B. STEWART, *Assistant Clerk*.

NOTE.

Believing the greatest demand for the Tariff Hearings before the Senate Finance Committee on H. R. 7456 will be only for those schedules containing the particular items in which each individual is interested, the preliminary prints have been revised and indexed and printed by schedules.

The hearings are paged consecutively and comprise the following separate documents:

American Valuation.
Dyes Embargo.
Schedule 1.—Chemicals, Oils, and Paints.
Schedule 2.—Earths, Earthenware, and Glassware.
Schedule 3.—Metals and Manufactures of.
Schedule 4.—Wood and Manufactures of.
Schedule 5.—Sugar, Molasses, and Manufactures of.
Schedule 6.—Tobacco and Manufactures of.
Schedule 7.—Agricultural Products and Provisions} combined.
Schedule 8.—Spirits, Wines, and Other Beverages} combined.
Schedule 9.—Cotton Manufactures.
Schedule 10.—Flax, Hemp, and Jute, and Manufactures of.
Schedule 11.—Wool and Manufactures of.
Schedule 12.—Silk and Silk Goods.
Schedule 13.—Papers and Books.
Schedule 14.—Sundries.
Schedule 15.—Free List.
Special and Administrative Provisions, and Appendix containing briefs received too late for printing in the volume containing the hearings upon the various schedules.

LEIGHTON C. TAYLOR, *Clerk*.

SCHEDULE 4.

WOOD AND MANUFACTURES OF.

FIR, SPRUCE, CEDAR, AND HEMLOCK LOGS.

[Paragraph 402.]

STATEMENT OF W. D. B. DODSON, GENERAL MANAGER PORTLAND CHAMBER OF COMMERCE, PORTLAND, OREG.

I submit herewith brief of Columbia River Loggers' Information Bureau on Pacific northwestern conditions, proving the right of the logging and lumber manufacturing industry of that region to tariff protection on their products, against Canadian competition, and ask your earnest consideration of the same.

Supplementing this argument for the Pacific northwestern lumber industry, we submit a general argument herein on the need for a tariff to foster and encourage forestry in the United States, make the lumber and wood products industry of the Nation permanent, and to make it possible for this Nation to realize a net income from more than 463,000,000 acres of its domain that otherwise may become totally nonproductive.

According to figures furnished by the Interior Department, the Nation has about 228,000,000 acres of cut-over lands, once forest, now largely denuded. Except for very light uses in grazing live stock, this land is now practically nonproductive. Most of it is valuable only for forestry. There are but two ways in which to make it again productive in the coming years: First, purchase by the Government or State as permanent forest reserve, and the expenditure of large sums in reforestation; second, reduce or eliminate annual taxes on this cut-over land, and protect America's wood industry against cheap imports of wood products until the private owners of such lands find an incentive to reproduce the forests as a commercial venture.

Within the Federal-owned forest areas of this country there are 153,933,460 acres, of which 20,574,000 are in Alaska. This forest will be cut in the coming years according to commercial requirements and the Government's policy of conservation. The Nation's burden in reforesting the Government reserves will be the difference between the market price of stumpage and the cost of replanting trees. If the market price of the Government's stumpage is forced down to a dead low level, through influx of cheap wood products from primeval forests of other countries, where cheap labor prevails, the Federal Government will have to spend a correspondingly greater sum in preserving for posterity the forests of our own reserves.

The exact acreage of privately owned timberland in the United States is not given on official authority; that is, commercial forests segregated from cut-over lands that were once commercial. The best figures we are able to secure from the Forest Service are to the effect that there remain in the United States to-day above 100,000,000 acres of forest bearing good merchantable timber, a major part of the timber itself being in private ownership. If, as the private timber owner cuts his forest, the low price of stumpage and heavy property tax afford him no incentive to reforest such lands, the cut-over tracts lie a waste, swept by fire for lack of protection, and largely become nonproductive.

In general, here we have a national asset of approximately 463,000,000 acres of land classed as forest, cut over, or yet in primary state. This is nearly 25 per cent of the total area of the United States proper. Most of this land is good for nothing but forest growth and light grazing of live stock. It is nearly twice the area actually cultivated each year in the country. With high cost of labor in America, reforestation work and fire protection can not be conducted at costs available in similar forestry work of other countries. If the Siberian and Russian forest products, and the Canadian forest products now, are permitted to enter freely, we believe that our

country will be unable to restock and protect from fire the new growth which would make these enormous areas of commercial value in the future. There is no surer method of insuring reforestation and protection of these lands than in creating a condition whereby a commercial return could be secured from the work.

If, in the coming years, the 463,000,000 acres of land now classed as forest could be made to yield an average return of $10 an acre annually, through timber for lumber manufacture, wood for pulp and all fiber products, better grazing areas for live stock, wood for fuel, poles and railway ties, and in addition to this commercial return a better conservation was insured of moisture precipitated and the country as a whole made more attractive, beautiful, and complete for the growing millions of population, is not such a result worthy of full consideration in the general policy which seeks to protect American industry? These lands are within the national walls. No coolie labor is available for their handling and development. Men who do needed work must live according to the high American standard. They eat the farmers' protected produce, and wear and use American industry's protected wares. Any consistent American protective policy can not disregard this right, nor be unmindful of the difference between 463,000,000 acres of waste and 463,000,000 acres of land yielding a substantial annual return to the American people.

If these forest lands are not protected and conserved, and the second generation finds itself dependent entirely for its wood requirements upon imports from the outside, the Nation will lose hundreds of millions of dollars annually. Under a proper fostering and protective policy, this outlay may be saved within the country, keeping the Nation complete, as in the past, in the production of all its major raw materials needed in our industries.

When our virgin forests seemed without limit, and reproduction was not needed, the American wood and lumber industry could meet all competition at home and abroad. With but 2,215,000,000,000 feet left standing, and consumption now at a rate four times as fast as reproduction, the policy of assuring better supplies in the future becomes imperative, unless we surrender the practice of meeting our own wood requirements. Whatever may have been thought proper in respect to duties on wood products in the past, the situation has changed.

The fallacious argument is offered that America's timber supplies will be better protected and conserved by opening wide the door to all wood products imports. If these unrestricted imports prevent reproduction work in America's forests, as they will unless the Government wants to make enormous appropriations for buying forest lands and restocking them, no surer means could be employed to completely denude the country of its forests. Cheap imports will kill the possibility of securing new crops of trees on lands capable of supplying this Nation and also furnishing a substantial export. Just as the cheap product from a foreign country, if not restricted by tariff, would kill the American factory, so it will kill America's wood industry. Just as a tariff, to meet higher production costs on the American living standard, is imposed for the farmer and the factory, it is needed in the wood products line. Cheap foreign imports will kill it, as soon as the virgin stand of timber has been cut.

BRIEF OF THE COLUMBIA RIVER LOGGERS' INFORMATION BUREAU.

Following the announcement that the lumber, shingle, and log schedule would be argued before the Senate Finance Committee August 26, we are herewith presenting you a short brief in favor of a protective tariff on the products of the timber operators in the Columbia River district.

1. In British Columbia, in the State of Oregon, and the State of Washington the overwhelming growth of timber is on the coast and the western portions of the States. The Canadian timber is connected by navigable streams flowing from almost every tract to the seas and easily accessible for shipping and for the accommodation of the heaviest draft vessels.

2. While it is true that the Columbia River district would not be affected as seriously as the Grays Harbor and Puget Sound districts by the importation of logs from Canadian waters, the effect on the Columbia River market would be practically the same. The timber in the northwest portion of the United States reaches practically the identical markets as the British Columbia output. These markets are competitive, and in consequence any serious effect that might be experienced in the Washington ports by the importation of Canadian logs would have exactly the same effect in the Columbia River district.

3. At the present time there are no logging camps on the Columbia River nearer than 9 miles to the booming grounds. In the State of Washington, where the lumber

industry has been more active for a long period of time, the logging camps are still farther remote from tidewater. In British Columbia, where the logging industry is a more recent undertaking, there is much timber directly on tidewater and also a far greater amount on short-rail hauls to the booms. This gives Canadian timber a far greater advantage on the original cost of the input of the logs into the water owing to the very short haul. The navigable waters in the British Columbia district reach far inland, and this will give them a very great advantage over a long period of years.

4. In the operations in the timber districts there is an advantage in the employment of labor. On the Canadian side a large number of Hindoos and other orientals are employed on a 9-hour and, in some instances, a 10-hour schedule. On the American side labor works only 8 hours a day, is far better paid, and no orientals are employed in any of the logging operations either in Oregon or Washington. This gives the Canadian operators a great advantage, and whenever their market is dull they can dump their surplus product into Puget Sound, Grays Harbor, or the Columbia River, thereby disorganizing the industry in the American Pacific Northwest.

5. The disorganizing effect not only of this dumping but the fact that it is liable to happen at any time is well expressed in a letter of Acting Forester E. A. Sherman, of the United States Department of Agriculture, July 18, 1919, to one of the associations of loggers in this district:

"The tendency of such unexpected and intermittent importations, based on unexpected suspensions of the Canadian export tariff, to unsettle the market and to be an additional factor of uncertanity in the logging business is fully appreciated."

6. The Canadian log producer has a still further advantage. He need not buy timber, and thus tie up capital, but may obtain it from the public lands of the Province on leases, which require him to pay only a royalty as he cuts. In times of depression, consequently, he has no loss of capital return. The tax burden borne by the timber owners of both Washington and Oregon has reached the breaking point. On one tract of 640 acres in Clatsop County, Oreg., the taxes in 1910 were $236 and on the 1920 assessment roll the same timber paid $2,700.04. In the Grays Harbor district a tract of 320 acres paid on the 1920 assessment roll $1,883.20. In both of these instances the tax on similar tracts in Canada would be approximately $140.

7. In the Columbia River district 90 per cent of the logging is done by independent loggers who have no interest in the operation of sawmills, and he is often compelled to log to protect his overhead and equipment charges when there is no market for his logs. In some instances he logs when the market is up and is forced to sell during chaotic conditions on a falling market. In the Eastern and Southern States the mills run their own logging camps. In the Pacific Northwest the conditions are not the same. It is unfortunate that many mill owners on the American side have become interested in timber on the Canadian side, and they can not be expected to be impartial in the use of the advantages they could enjoy in the Canadian importations or upon questions of tariff.

8. As the tariff has much to do in protecting the American shingle market, it is well to cite here that there are 32 shingles mills in the Columbia River district that are dependent absolutely upon independent loggers for their raw material. The flooding of the American market with Canadian shingles would close down these mills and would result in the accumulation and waste of the cut of cedar in the entire Columbia River district. This would throw hundreds of men out of employment and would make it absolutely necessary for the fir product of the logging camps to carry the burden of the loss and waste in the cut of cedar. This same condition would prevail in the Puget Sound and Grays Harbor districts. At the present time one Canadian operator is selling rafts of cedar logs in the Puget Sound district. Thus far the Columbia River district has escaped this experience.

9. The item of taxes mentioned earlier in this brief can be expressed more definitely when we state that privately owned timber in the State of Oregon to the extent of 254,000,000,000 feet is carrying the tax burden to support 189,700,000,000 feet of publicly owned timber which pays no taxes whatever. The timber is owned as follows:

	Feet.
In western Oregon:	
Privately owned	211,000,000,000
Owned by the State	1,500,000,000
In national forests	85,500,000,000
Indian reservations, parks, and public domains	45,000,000,000
In eastern Oregon:	
Privately owned timber	43,000,000,000
In national forests	46,700,000,000
In Indian reservations, parks, and public domains	11,000,000,000

In the Columbia River district alone in western Oregon there are to-day 48 independent logging operators.

10. The vast logging equipment working in this State's timber resources must be kept going or eat up its value in idleness. What the loggers would be driven to under this system of conservation would be a woeful but inevitable slaughter of his timber. Compelled to keep his equipment going and to dispose also of his timber in order to get some return from his investment, he would fell trees as before, but carve out only the more profitable portion and leave the rest as waste, rendered useless by foreign competition, where before it could be marketed at an advantage. This is something that none of us look forward to with pleasure, but as the timber is our own and we would not let ourselves be forced into bankruptcy, we would have no other course.

11. This association has refrained from troubling Congress for any protection so long as the demand on this side was sufficient to absorb the whole of our product. It wanted no unnatural stimulus. Recently, however, there has been a great change. The demand for our product has greatly fallen off. On the Canadian side in turn there is great dullness. The temptation of the Canadian to hurry his logs into our markets is therefore great, and if it be said that the demand on our side has fallen off, still some demand remains, and this will seek the Canadian article in preference to ours because of the premium on the American dollar in Canada, ranging during the past year not under 8 per cent and rising at times to 20. The temptation of the American mill man now to buy Canadian logs on Puget Sound is almost irresistible, and the western Washington loggers are placed in a position extremely dangerous and unfair.

12. While a mere antidumping act would not be a sufficient protection against the Canadian product, it is proper to notice that the Canadian Parliament by act of 1907 has protected the Canadian Provinces against dumping into Canada by foreign countries. (Appendix 18, p. 208 of Canadian Consolidated Customs Acts.)

MAHOGANY AND CEDAR LOGS.

[Paragraph 404.]

STATEMENT OF JOSEPH S. AUERBACH, REPRESENTING THE MAHOGANY ASSOCIATION OF THE UNITED STATES.

Mr. AUERBACH. I wish, on behalf of my clients, to thank you very much for acceding to the request of Senator Smoot that this short hearing as to section 404 be advanced. I shall be very brief in my remarks, and we shall keep within the limit of time prescribed by you.

With your consent, the hearings will be consolidated so as to include seven on the list—G. B. Mulgrew, Otis Manufacturing Co., Thomas Williams, C. L. Willey Co., Freiburg Mahogany Co., Willard-Hawes & Co., and Ichabod T. Williams & Sons. Mr. Williams will submit a formal statement which has been agreed to by his associates; Mr. Arkush and Mr. Otis will add only brief additional statements. There will be no brief filed by us, unless it seems to be necessary by reason of questions asked of witnesses or unless it be at your request.

Since the Civil War—and, I think, far back of that time—there has not been, so far as we are informed, in the history of congressional legislation by any party a case where a raw material not produced or producible here has ever been subjected to a duty. Certainly this is true of mahogany and other tropical hardwood logs now under consideration. Yet you propose to impose upon such logs a duty of 10 per cent and upon the manufactured lumber a duty only of 15 per cent.

Senator WATSON. Do you refer to all kinds of lumber?

Mr. AUERBACH. Yes, to all the timber referred to in section 404, included under the head of "Tropical hardwood logs."

Senator WATSON. I just wondered whether you were testifying to all kinds mentioned in section 404.

Mr. AUERBACH. Yes; all tropical hardwood logs in 404, although primarily mahogany.

I am in a way only submitting considerations introductory to the statements of the witnesses who will testify. What will be developed in this hearing is that the return to the Government will be negligible. The 10 per cent will not be 10 per cent net. For the expense of handling, measurement, etc., to which these logs will be subjected, and to which they are not subjected now, will be largely in excess of this 10 per cent. At present, when vessels come into port, the logs are thrown in the water and go from there to the mills, which have been constructed with reference to this method of delivery—brought about by the uniform, unbroken policy of the Government for an indefinite period in not taxing the logs.

Now, the first thing these importers think of in a matter like this, and the first thing they ought to have in mind, is good citizenship and the putting aside of their selfish interests. And I am safe in saying that they would not appear and oppose any bill which would appreciably add to the amount of Government income, unless it was a serious menace to their business. They, however, wish to present to you the consideration and emphasize the fact that there will be no substantial return to the Government from this duty, if the Government assumes, as it should, the expenses necessary to the importing and manufacturing interests. That this will be the necessary effect will be demonstrated from the statements to follow.

The witnesses will, as I say, make it abundantly plain to you that the burden will amount to a great deal more than the 10 per cent ad valorem duty. For the cost, among other items, of demurrage and wharfage charges and of rehandling this lumber at the point of destination—which American bottoms, though in crying need of freight, carry under great difficulty even now—will cooperate to swell this expense. In fact, the steamship lines have notified the importers that they will be obliged to put an embargo on that kind of freight if section 404 be enacted. It is in their opinion impracticable to handle it unless they can dispose of it, as at present, when it comes into port, by simply dumping it overboard in the ponds adjacent to the mills, whence the manufacturer lifts it into his mill as he requires it. The importers will also demonstrate to you by their statements or by such questions as you may address to them that the additional cost of these logs—if dutiable as proposed—will more than offset the 15 per cent duty that is to be put upon manufactured lumber. Accordingly, a uniform governmental policy, time out of mind, to let in free of duty raw materials not produced or producible here and impose reasonable protection upon the manufactured article, is wholly departed from, without benefit to the Government and with distinct disadvantage to importer and manufacturer.

The statements to follow will make it impossible for these assertions to be controverted.

STATEMENT OF THOMAS WILLIAMS, REPRESENTING ICHABOD T. WILLIAMS & SONS, NEW YORK CITY.

The CHAIRMAN. You may state your full name?

Mr. WILLIAMS. Thomas Williams.

The CHAIRMAN. Where do you reside?

Mr. WILLIAMS. New York City.

The CHAIRMAN. What is your business?

Mr. WILLIAMS. Importer of foreign woods.

The CHAIRMAN. Will you state your views on this paragraph 404?

Mr. WILLIAMS. I have photographs here, gentlemen, of the character of the raw material represented in paragraph 404, which I would be glad to have you inspect. I will only take 10 minutes of your time.

I am here to represent a committee appointed by the Mahogany Association of the United States, and as chairman of a committee composed of Mr. Arkush and Mr. Frank Otis, of New Orleans, appointed at a meeting of the importers and manufacturers of tropical hardwoods in the log, and personally to represent the firm of Ichabod T. Williams & Sons, of New York, of which I am senior member.

Our firm has conducted a business importing and manufacturing foreign hardwoods for 83 years, and this is the first time we have had to appear before a committee of Congress to discuss the question of duty on unmanufactured logs of tropical hardwoods. In all these years under Republican and Democratic administrations, and in all the tariff bills introduced during this time, unmanufactured logs of tropical hardwoods have always been on the free list. It is for this reason that no effort was made to secure a hearing before the committee of the House, when the wood schedule was under consideration. In perfect faith that there would be no reversal of policy established for so many years, probably $25,000,000 have been invested in the manufacturing of these woods, and in the establishment of agencies in the Tropics for production.

The goods in question can not be produced in this country. No tropical hardwood can be grown in the latitudes of our country, and I am forced to the conclusion that in the haste of preparation the fact that these logs have always been on the free list was overlooked; or else that the committee of the House thought some revenue might be obtained from the imposition of a 10 per cent duty.

Senator SIMMONS. Do the House hearings show that anyone appeared before the House committee and asked that that duty be imposed?

Mr. WILLIAMS. I have no knowledge of that, Senator. I rather doubt it.

Senator CURTIS. I think it is a revenue duty. They imported about $6,000,000 worth of this wood last year, and I think it is purely a revenue proposition.

Senator SIMMONS. I was assuming if nobody appeared asking for it, it must have been a revenue proposition.

Mr. WILLIAMS. That is my judgment.

Senator SIMMONS. That must have been the case if nobody appeared. I understand you to say no one did appear?

Mr. WILLIAMS. Not to my knowledge.

Senator SIMMONS. I thought possibly somebody making walnut furniture might have appeared and said your furniture was in competition with them.

Mr. WILLIAMS. There is nothing in the record, Senator. May I continue?

The CHAIRMAN. Go on.

Mr. WILLIAMS. Should the latter view be correct, it is my opinion—and I find myself confirmed in this by the unanimous opinion of the trade—that no considerable revenue would be derived, and that the expense of the collection would be equal if not more than the money received.

These logs of tropical hardwoods are imported from Africa, Central America, and Mexico almost exclusively on American bottoms, and are imported practically exclusively by American manufacturers and importers.

It is a large tonnage, represents a great many steamers. The imposition of such tax would divert the importation of mahogany logs to foreign countries, and would lead to the manufacturing of such logs into lumber and veneers in foreign countries for ultimate importation into the United States by foreign interests.

I therefore appear in opposition to the proposed import duty in the so-called Fordney tariff bill upon logs of Spanish cedar, lignum-vitæ, mahogany, and other tropical hardwood logs. And inasmuch as the hearing before you may be somewhat extended, I desire—in advance of the statements to be submitted by the several interested parties who will ask to be heard in opposition—to submit to you, in writing, the salient objections to this part of the bill as they present themselves to my mind.

This, I think, will afford you information for some questions you may wish to ask as the discussion proceeds, and, in addition, may be convenient for you to refer to in your subsequent deliberations.

And I wish to add that, so far as my investigation goes, the statements contained in the memorandum can not be controverted; and further, that neither from the point of view of the importer, the manufacturer, the purchaser and consumer of the finished product, the American exporter, nor the laborer can this proposed duty be defended.

That it is unjustified is, in part, evidenced by the policy of Congress in having kept such logs on the free list since the time of the Civil War. On the other hand, there has been a high duty on the importation of mahogany and other hardwood lumber in order to afford adequate protection to the manufacturers of lumber from such logs and to the veneer manufacturing industry of our country—employing thousands of American citizens in New Orleans, Boston, New York City, Philadelphia, Cleveland, Cincinnati, Chicago, Louisville, Ky., San Francisco, and in other large centers.

By the imposition of such an import duty additional cost would be incurred through delays and embarrassment of handling, etc., resulting in increasing freight rates whereby the existing just and necessary protection to the domestic lumber and veneer interests would be seriously affected by importation from foreign manufacturers.

Moreover, these logs are raw material not producible in this country, and such a duty would put a premium on the cutting down of the small quantities of other hardwoods we do have, which the legislative as well as the executive departments of our country are so solicitous about conserving.

Then, too, the exportation business of the manufactured product from these logs, which is considerable and increasing, will be menaced by reason of the fact that the foreign manufacturer would secure his logs without the additional costs due to the imposition of duty.

There is this further consideration which should be given weight by the members of the Finance Committee and of Congress: At the outbreak of the war American merchants secured control of the markets in these logs in Central and South America from the Germans and the British, and a profitable export business has, through this control, been built up by American manufacturers. This promising export business not only opens inviting markets to the American manufacturer, but furnishes freight to American steamships at a time when there is a dearth of it for our merchant marine.

And while members of the committee will naturally scrutinize statements coming from an interested source, I am confident that, after your most careful examination and reflection, you will find the proposed duty to be indefensible from the point of view of importer, manufacturer, consumer, and laborer, and generally prejudicial to the commercial interests of the United States.

Yet all these disadvantages would—after the expenses of inspection, handling, and measurement—result in only a negligible advantage, if any, of a net return to the Government.

I would like to have you feel, Senators, that I am here with my associates to give you all the information in our power. We desire to be helpful to the committee in bringing out the truth. We welcome any interrogation, and we court the fullest investigation.

Senator WALSH. What do you estimate the revenue to this country will be under this tax?

Mr. WILLIAMS. Last year the importations of mahogany and cedar logs into this country was in the neighborhood of 50,000,000 feet. The figures as given before the House committee represented a value of $4,500,000. Ten per cent duty on that would be $450,000.

Senator WALSH. What do you estimate to be the cost of collecting it?

Mr. WILLIAMS. I think it would be a million dollars.

Senator WALSH. What makes you think that?

Mr. WILLIAMS. Because this is a very bulky raw material. We have the American valuation in this bill, and this wood is brought to this country in cargo loads on steamers carrying from three to five thousand tons. In order to secure the valuation it will be necessary to examine the timbers.

Senator WALSH. How many ports do these steamers come to, where there will have to be agents to inspect them?

Mr. WILLIAMS. Probably from six to eight from the Gulf as far east as Boston. You must remember that each log will weigh from 2 to 7 tons. Each one has to be handled in order to be measured. We have estimated, and I have taken the opinion of most all engaged in that business in the country, and it is thought that can not be done. We can not handle that wood the second time.

Senator SMOOT. There are no such woods produced in the United States, are there?

Mr. WILLIAMS. None.

Senator SMOOT. Then the American valuation will not cut any figure on that. They will not have to be examined, because if that is the case we take the foreign valuation.

Mr. WILLIAMS. Then I misread the act.

Senator SMOOT. The House provision will be changed in that respect.

Mr. WILLIAMS. That will simplify matters and will somewhat reduce the cost, but nevertheless I am convinced that the cost of collecting the revenue will be more than the Government will receive.

Senator McLEAN. If the examiner takes the invoice value it will not cost very much.

Mr. WILLIAMS. Then you will have to handle the wood to get the quantity.

Senator McLEAN. Not if they take the statement of the importer.

Mr. WILLIAMS. I think we are prohibited by the administrative feature of the present bill from doing that. Of course, if you make it as easy as possible we can greatly reduce the cost of handling and measuring woods.

Senator SMOOT. It is measured now, is it not? You do not rely entirely upon the foreign exporter for the number of feet in these logs, do you?

Mr. WILLIAMS. No. We remeasure all the wood.

Senator WALSH. At the manufacturer's plant you measure it?

Mr. WILLIAMS. Yes, sir.

Senator WALSH. Not at the port of entry?

Mr. WILLIAMS. Oh, yes, at the port of entry, where we have unusual facilities for doing it. These photographs show that the steamers come in and the entire cargo is thrown at once into the water and we measure it at our convenience. But the difficulty and the cost of handling these units that run from 2 to 7 tons each in weight is tremendous. Unless you have the machinery provided for that, it will be almost impossible.

Senator SIMMONS. Mr. Williams, there is one thing I can not quite understand about this paragraph. Various kinds of woods are specified here, and an ad valorem of 10 per cent is placed upon them. Then the manufactured parts of the woods are enumerated and a duty of 15 per cent is placed upon them. Then in what we might call the "catch all" clause there is "wood unmanufactured, 20 per cent ad valorem."

Senator SMOOT. That is for the mills.

Mr. WILLIAMS. I think that refers entirely to the mills.

Senator SMOOT. Oh, entirely.

Senator SIMMONS. That is confined to the mills?

Mr. WILLIAMS. Entirely so.

Senator SIMMONS. Very well.

Mr. WILLIAMS. That the imposition of a duty on this raw material would injure the American mechanic—would affect hundreds of thousands of men—can not be questioned; and we have the utmost confidence that you have at heart the real interests of all classes, and that nothing could be further from your thoughts than action which would result in the destruction of an important business interest, and I therefore ask that you will favorably consider amending the proposed bill by continuing the phraseology of section 648 of the present wood schedule, which reads as follows:

FREE LIST.

Woods: Cedar, including Spanish cedar, lignum-vitæ, lancewood, ebony, box, granadilla, mahogany, rosewood, satinwood, and all forms of cabinet woods, in the log, rough, or hewn only, and red cedar (Juniperus virginia) timber, hewn, sided, squared, or round; sticks of partridge, hair wood, pimento, orange, myrtle, bamboo, rattan, reeds unmanufactured, India malacca joints, and other woods not specially provided for in this section, in the rough, or not further advanced than cut into lengths suitable for sticks for umbrellas, parasols, sunshades, whips, fishing rods, or walking canes.

STATEMENT OF REUBEN ARKUSH, REPRESENTING WILLARD HAWES & CO. (INC.), NEW YORK CITY.

The CHAIRMAN. You may state your name.

Mr. ARKUSH. Reuben Arkush.

The CHAIRMAN. Where do you reside?

Mr. ARKUSH. New York.

The CHAIRMAN. What is your business?

Mr. ARKUSH. Importer.

The CHAIRMAN. Importing what?

Mr. ARKUSH. Mahogany and cedar logs. We do not manufac ture them. We import and sell them to concerns like Mr. William and Mr. Otis.

I have written down two or three short notes I would like to ca attention to. I will not be 10 minutes.

To show you what it does for the railroads, last year we importe and sent into Pensacola five small steamer cargoes which went fro Pensacola to Louisville, and gave freight for 400 cars. In May v imported by the small steamer *Trafalgar* 1,354 logs. Two-thirds them went west in 84 cars, going to Cleveland. We had 2,500 to from Africa direct, which was shipped west in 150 cars. It is m opinion that in a very short time all those logs will be sawed in Mexi and shipped as lumber, if there is a duty put on the raw materi on the raw logs.

The steamship *Gran* arrived yesterday from Mexico with 1,8 tons of logs and 200,000 feet of sawed lumber. There are a numb of sawmills there that used to saw the lumber for England, but n England can not buy. The English market and Continental mark are not buying anything, and they are shipping it to New York a we are selling it. On those logs we are paying $25 a thousand fe Scribner measure, and on the lumber a freight of $12 a thousand fe That is handicap enough for the American mills. They have up-to-date modern sawmill in Mexico, and if there is a duty on lo which will increase the cost to the manufacturer here, other mi will be built—there are mills now in Central America and Nicaragua and the lumber will come here sawed, because the freight will half as much.

Senator McLEAN. You could remedy that by raising the duty sawed lumber.

Mr. ARKUSH. I was just going to say, if you answer, "Very we we will increase the duty on sawed lumber," you are reminded th there is a limit above which you can not fairly go in assessing dut on lumber from Mexico as compared to lumber from Canada. The is a limit as to what duty you can put on sawed lumber.

Senator WALSH. Why?

Mr. ARKUSH. You would not put a prohibitive duty on sawed lumber?

Senator McLEAN. It would not be a prohibitive duty on sawed lumber if it was not produced in this country. You would have to charge the duty to the consumer here.

Mr. ARKUSH. I hardly think we would want to put so high a duty as 10 or 15 per cent on lumber.

Senator WALSH. Will you give us very briefly a concrete case, showing the duty on 100,000 feet of logs imported to America and 100,000 feet of sawed lumber.

Mr. ARKUSH. One hundred thousand feet of logs, at $100 a thousand, the duty would be $1,000; and 100,000 feet of lumber, it would be $1,500.

Senator WALSH. The difference is not enough?

Mr. ARKUSH. The difference is not enough. I do not believe, as a matter of fact, that Mr. Fordney intended to put a duty on the logs. The first copy did not provide a duty, and then he was bombarded with telegrams, and he said, "Oh, yes, you are right. We will have to put a high duty on lumber." So he made it 15 per cent.

Senator WATSON. If this tariff is imposed, will as much of that lumber be imported as hitherto?

Mr. ARKUSH. Logs will not be imported. They will be sawed into lumber.

Senator WATSON. And the lumber imported?

Mr. ARKUSH. And the lumber imported, because the freight on the lumber is not much over half what it would be on logs. A vessel will carry double the number of feet of sawed lumber that it will in logs.

Senator WATSON. Suppose this rate stands as it is in this bill, it practically excludes the logs, and the business will be carried on by the importers with sawed lumber?

Mr. ARKUSH. Sawed lumber, yes, sir. Mr. Otis is a sawmill man from New Orleans, and he will talk from that point of view.

(The witness submitted a letter written by him under date of August 23, 1921, as follows:)

NEW YORK, *August 23, 1921.*

Hon. BOIES PENROSE,
Chairman Finance Committee,
United States Senate, Washington, D. C.

DEAR SIR: We have asked permission to appear before you to protest against the proposed duty on rough mahogany and cedar logs, and other rough cabinet woods.

Never before has there been a duty imposed on the rough log, and the importation of mahogany and cedar logs in this country has been growing from year to year, and is now of considerable importance. Mills for the converting of the logs into lumber and veneers are established in New York and vicinity, Philadelphia, Baltimore, Louisville, New Orleans, Mobile, Cincinnati, Chicago, Cleveland, Indianapolis, and in all the important middle west cities. Millions of dollars are invested in these mills that convert the logs into lumber and veneers. To impose a duty on the logs will only encourage the building of mills in Mexico and Cuba and other places of production. None of these woods grow in this country, therefore a duty is not required for protection. It has been the policy of this Government to encourage the importation of these tropical hardwoods, in order to protect the diminishing supply of our own domestic hardwoods.

The inconvenience that would be caused to the importers and the steamship people in measuring the logs and delaying the discharge of the steamers would be considerable, and we really believe that the cost to the Government would practically absorb the duties that it would collect from this proposed new tariff. On the other hand, the 10 per cent duty, plus the additional cost by reason of delays and rehandling, would

considerably enhance the price of mahogany and cedar lumber to the manufacturer, which would be reflected in the cost of furniture to the consumer.

We can absolutely see no benefit to the Government in this proposed tax, and only a great handicap to the industry. We therefore can not too strongly protest against the proposed tax on the rough mahogany and cedar log. There is already a duty on sawed lumber and on veneers, to which there can be no objection.

Yours, very truly,

WILLARD HAWES & CO. (INC.).

STATEMENT OF FRANK G. OTIS, REPRESENTING OTIS MANUFACTURING CO., NEW ORLEANS, LA.

The CHAIRMAN. What is your business?

Mr. OTIS. Importing and manufacturing mahogany logs into lumber.

The CHAIRMAN. We have heard two witnesses on that subject.

Mr. OTIS. I only want to supplement what Mr. Williams said in his statement: An average cargo of 500,000 feet would have an additional cost to measure logs and assess duty of $10,900, and it will be necessary for us to bring these logs in and land them on the wharf, have them measured, bring them out on freight cars up to our plant, and again discharge them into our boom.

The CHAIRMAN. Do you desire to file a brief?

Mr. OTIS. No, sir.

The CHAIRMAN. That is all you have to say?

Mr. OTIS. Yes, sir.

Senator SMOOT. Most of these logs are made into veneers?

Mr. OTIS. Into lumber and veneers.

Senator SMOOT. Most of them go into veneers?

Mr. OTIS. No, sir; the largest percentage goes into lumber; 80 or 90 per cent goes into lumber.

Senator WALSH. What differential should there be, in order to protect the labor, between the duty upon the logs and the duty upon the sawn lumber, in your opinion?

Mr. OTIS. In my opinion, there should not be a duty on the logs at all.

Senator WALSH. Assuming that there is.

Mr. OTIS. Assuming that there is, there should be a difference of at least 30 or 40 per cent.

Senator WALSH. So that if this rate of 10 per cent ad valorem on logs stands, the lumber schedule——

Mr. OTIS (interposing). It amounts to 30 per cent.

Senator WALSH. The lumber schedule would amount to about 40 per cent ad valorem?

Mr. OTIS. Yes, sir.

Senator WATSON. How many mills are there in this country sawing these logs?

Mr. OTIS. There are about 10 mills, representing an invested capital in the neighborhood of $20,000,000. That goes into a dozen industries—furniture, phonograph cabinets, and into trim.

Senator WATSON. And also musical instruments, these fine woods?

Mr. OTIS. Yes, sir.

Senator SIMMONS. What is the price that you have to pay for a thousand feet of mahogany lumber?

Mr. OTIS. In the log?

Senator SIMMONS. Yes.

Mr. OTIS. It varies from $80 to $100, and the cost of the freight amounts in the neighborhood of $40 or $50 for the logs.

Senator SIMMONS. It would be $140?

Mr. OTIS. That is the maximum price.

Senator SIMMONS. What do you get a thousand feet for sawed lumber?

Mr. OTIS. It depends largely on the grade, Senator. We divide up our lumber after we saw the logs into 50 or 60 grades, going from No. 2 common to firsts and seconds.

Senator SIMMONS. You get more for a high-grade log than you would for a low-grade log?

Mr. OTIS. No, sir.

Senator SIMMONS. Let us take the same grade.

Mr. OTIS. We buy it log run, as you might say. We make a contract with a man in the Tropics to bring out the logs as they come. Some logs will be worthless.

Senator SIMMONS, Referring to awhile ago when you said $140, including the freight, were you giving the average price?

Mr. OTIS. Average price.

Senator SIMMONS. What is the average price at which you sell, after you have manufactured—that is, what is the profit?

Mr. OTIS. It nets us about 10 per cent. Of course, those costs vary from time to time, as freights vary and tropical prices vary.

Senator SIMMONS. That is the profit? I was trying to get you to tell me what you sell those boards for.

Mr. OTIS. An average price on our log run would be in the neighborhood of $160 to $170.

BRIEF OF FIFTY LEADING IMPORTERS AND MANUFACTURERS OF MAHOGANY.

Section 404 represents a radical departure from a uniform governmental policy in tariff legislation, for heretofore that policy has been to keep on the free list such raw material as was not produced or producible in this country, and to impose a duty only upon the manufactured article. It is clear that this policy has been reversed in this case, as was pointed out at the hearing and as will be emphasized again in this memorandum. For since the Civil War—neither under Democratic nor Republican administration—has any duty been imposed upon mahogany or other tropical hardwood logs. And all that the parties in opposition to the proposed new duty are asking is that these logs be permitted to remain where they have thus far been and where they belong—on the free list.

The proposed import duty will not be for the benefit of the Government, inasmuch as the expenses of measurement, handling, etc., by the Government would greatly exceed the 10 per cent duty, which, according to the figures submitted to Congress for the year 1920, would be about $450,000 gross. Under the present well-recognized conditions of business generally it would be appreciably less.

Yet—by the following statement of Mr. Frank G. Otis, of the Otis Manufacturing Co. of New Orleans, who is peculiarly well informed upon the subject—it appears that the additional cost of handling the hardwood logs if they are put on the dutiable list would be more than twice the amount of the import duty, and that the Government would not only not receive any income but would be subjected to an actual expense:

At the present time the three mahogany mills located in or near New Orleans are built on the banks of the Mississippi River. All logs received by these mills are now brought in on ocean-going steamers right to the three log ponds located directly in front of these mills. The steamers discharge their log cargoes directly into the several log ponds in the Mississippi River as quickly as the steamers' gears would permit. From a day and a half to two days has been the usual time necessary to completely discharge a cargo of logs.

Often a large steamer has been able to discharge a cargo of logs and to load an outbound export cargo in a week's time.

"Once logs are discharged into the several log ponds in the Mississippi they float down to the mills without further delay or expense and are cut into lumber.

"Assuming that a duty is imposed on these logs, it will be necessary to secure a very large wharf capable of holding 2,400 tons where cargoes will be landed for measurement and examination. The following expenses will necessarily be incurred:

"Wharfage at 14 cents on steamer of 2,000 tons (which includes 6 free days).	$280.0
"Assuming logs are left on wharf 3 weeks during measurement (less 6 free days), there would be storage charge at 10 cents a ton for 15 days........	3,600.0
"Inspection fee measuring cargo, 15 cents per ton........................	360.0
"Moving 500,000 feet (2,400 tons) from dock to our plant would necessitate 125 freight cars, switching charges each car $11.33..................	1,416.2
"Labor handling logs on wharf for inspectors (logs weigh from 1 to 7 tons)..	268.8
"Labor unloading and rolling into ponds in Mississippi River, $10 per thousand feet..	5,000.0
"Total..	10,925.0

"For mills located just above port there would be an additional charge of $14 per thousand feet, principally for railroad freight.

"If the Fordney bill should become a law, the amount of duty that would be collected on an average cargo would not exceed $5,000. Yet the accompanying expense—no matter by whom it is borne—would amount to $10,925.05, in the end a serious and direct loss to American shipping. For the result would be that the importation of mahogany and cedar would be discouraged, and the construction of mills throughout Central America, Mexico, Africa, and possibly Germany encouraged to the disadvantage of the American laborer as well as the American importer and manufacturer."

If it be proposed that this expense be unjustifiably loaded upon the importer, then it would inevitably happen that these woods would come into this country as manufactured lumber and not as raw material in the shape of logs; for otherwise this additional expense, incurred directly and indirectly by reason of the duty, would seriously handicap the sale of the sawed lumber to the ultimate manufacturer and by him to the domestic and foreign consumer.

These logs on reaching this country enter into the following among other manufacturing industries: Cigar box, furniture, interior trim, and piano manufacturers; railroad coach builders; talking machine manufacturers; panel and pattern makers; shipyards and boatbuilders; cabinet makers; aircraft manufacturers; planing mills; office equipment manufacturers; picture-frame makers; coffin manufacturers; carpenters and builders; musical instrument makers; novelty manufacturers; street-car builders; bowling alley (lignum vitae), flooring, sporting goods, automobile, soda-water bar fixtures, electrical equipment, and molding manufacturers.

Inasmuch as the payment of the duty and expenses by the importer would largely exceed the 15 per cent protection afforded to lumber manufactured from these logs, there would be a menacing, if not disastrous competition, both here and abroad, between the American manufacturer and foreign manufacturer, who will get his logs free of duty.

If such logs are put on the dutiable list, with the consequent embarrassment of handling them as described in Mr. Otis's statement, its effect upon our merchant marine will be that shipments will be diverted to other countries; for even at present the steamship companies carry these logs under considerable difficulty and with a freight rate largely in excess of that for manufactured lumber. The steamship companies have already notified the importers that they can not handle the freight under such conditions as would be brought about by imposition of the proposed duty, which would also be a serious financial burden to importer and subsequent manufacturer. The consequent loss also to the railroads of many thousand carloads of freight on logs for shipment to interior mills is apparent by a reference to the statement of Mr. Arkush.

The sawing of these logs is an important item in the manufacture and, according to the common testimony of all the importers, requires the employment of thousands and thousands of laborers. If the proposed duty be imposed, the benefit of this first and substantial manufacture will go to the native laborer in the mills of Africa, Mexico, and Central and South America and not to the American laborer.

Many of these industries—into which, as stated above, tropical hardwood lumber enters—during the war began to acquire a substantial export business, which, having regard to general business depression, is continuing acceptably. If the extra cost be added to these logs, consequent upon the imposition of this duty, these manufacturing industries must for a long time surrender any hope of continuing their export

trade or of reacquiring it under the conditions which the provisions of 404 of the proposed tariff bill would bring about.

Those appearing in opposition to section 404 of the bill urge upon Congress and the Senate Finance Committee this further consideration: That at a time when it is notorious that there is a general business depression there should be no change for the worse, so far as the importer or manufacturer or exporter is concerned. If there is to be any change, it should be for the betterment of industry and not to its embarrassment, though it is to be remembered that these importers and manufacturers and exporters are not asking for any modification of existing conditions.

In short, instead of seeking to impose additional burdens upon business, it is respectfully suggested that the success of business should be promoted by any legislation where it is required and by leaving present conditions as they are when favorable to business revival.

It is for this reason that the importers, speaking for themselves and for such manufacturers and exporters as they have consulted, respectfully urge upon Congress that the present provisions of the Payne-Aldrich tariff bill—which have been the provisions of all tariff bills since the Civil War, and even before that—be left undisturbed.

They further submit that any additional income the Government may seek to derive from the importation, manufacture, and export of tropical hardwood logs and lumber—but not in fact securable through this proposed duty—should be obtained out of Federal income taxes collected of corporations and individuals engaged in this industry, which, with general business revival, will prosper, and thus yield to the Government the desired increase of revenue.

CEDAR POLES.

[Paragraph 405.]

STATEMENT OF T. M. LANE, NEW YORK CITY, REPRESENTING THE CEDAR POLE INDUSTRY.

The CHAIRMAN. Mr. Lane, will you state where you reside?

Mr. LANE. I am an attorney, Mr. Chairman and members of the committee, residing in New York City.

The CHAIRMAN. Whom do you represent?

Mr. LANE. I represent 12 concerns who handle and market at least 85 per cent of the cedar poles for wire-carrying purposes produced both in Canada and in the United States. A telegram which I have just received states that these concerns whose names are signed to our petition produce between 60 and 70 per cent of the total cedar-pole production of the United States. When the committee is informed that at least two-thirds of the poles used for wire-carrying purposes in this country are cedar, it will appreciate that the petitioning interests are fully representative both of production and sale in this country.

The CHAIRMAN. What part of the United States do those poles come from, chiefly?

Mr. LANE. They come chiefly from Montana and Idaho, which are the chief producing States at this time. There are some in the State of Washington, but not so many.

The paragraph regarding which I wish very briefly to address you is 405 of the House bill. It imposes a duty of 10 per cent ad valorem on telephone, trolley, electric-light, and telegraph poles of cedar and other woods. I am here to submit a petition on behalf of the interests producing and handling these commodities, requesting that the ad valorem classification of cedar poles be abolished, and that they be given the same treatment as the other round timber in the act. All other round timber is either free or dutiable a[illegible] rate. Poles are the only exception, I believe.

I might add, Mr. Chairman, that Mr. C. P. Lindsley, the chairman of the Red Cedar Association, came to Washington about two weeks ago, upon my notification that the committee was to begin hearings, under the mistaken assumption that this subject would be reached. He was forced to return to Spokane, but stands ready to return at any time at the committee's convenience, if further facts are desired than those I am able to present.

Senator WALSH. If that transfer could be made, what would be the rate on cedar poles?

Mr. LANE. There are two rates upon round timber now provided in the bill, in addition to one classification of free entry.

Paragraph 401 provides for round timber used for spars or in building wharves, one-half of 1 cent per cubic foot. We have suggested as one solution of the problem that poles be especially enumerated in that paragraph.

I might say that cedar logs used for poles are also used for piling, and that classification would tend to greater consistency of legislation and avoid litigation, because, as the bill stands now, the same cedar pole when imported for any other use than for wire-carrying purposes will either be free or pay 1 cent per cubic foot duty under 401 or $1 per thousand feet, board measure, under paragraph 402.

Senator SMOOT. The paragraph you are speaking of now is in exact accord—exactly the same right being both in the present tariff, the Underwood-Simmons law, and the Payne-Aldrich law. There is not a thing changed.

Mr. LANE. That is very true, Senator.

Senator SIMMONS. Let me ask you, Are those poles imported for any other purposes except for the purposes mentioned in 405?

Mr. LANE. They are used very largely, Senator Simmons, for piling, wharf-building purposes, as well as wire-carrying poles.

Senator SIMMONS. Do you think there ought to be the same duty?

Mr. LANE. I think the same classification should be given them. As it is now, a cedar pole that is almost identical with the pole used for telegraph-wire carrying will come in under paragraph 401 at a specific rate if we import for making spars or for building wharves. If we import poles for building a breakwater, it is a considerable question whether that is wharf building, and they would come in under 1683 of the free list, under the construction as put upon it by the court as round, manufactured timber, or pay $1 per thousand under paragraph 402.

Senator SIMMONS. Under 401 it is "timber, hewn, sided, or squared otherwise than by sawing?

Mr. LANE. Then it goes on "round timber used for spars or building wharves." If it is used for piling—and a great many of them are—it would be a half cent a cubic foot under that provision, which is round timber and nothing else. The production of poles is a logging proposition; it is not the production of lumber at all.

Senator WALSH. By transferring cedar poles to 401, as you request, would the rate be reduced on cedar poles?

Mr. LANE. It would be reduced somewhat, Senator, but I do not believe that the amount of duty would be reduced. The present rate, as I shall show you presently, is considerably deterrent to importation.

Senator WALSH. Then it is not to get a higher duty, but it is for the purpose of getting all round or pole cedar on an equality?

Mr. LANE. We think it should be treated on an absolute equality. The Underwood bill is 10 per cent and the Payne bill was 10 per cent on foreign valuation. There is a very important difference, and it is a vitally important difference that the committee in this bill has continued the 10 per cent ad valorem rate of the Payne-Aldrich bill and the Underwood bill but by virtue of section 402 has made it applicable to the American valuation.

Senator WATSON. Are any of these poles imported for fence posts?

Mr. LANE. Not in this form. The fence post is a smaller proposition.

Senator WATSON. They are not included in 405?

Mr. LANE. Four hundred and five covers "paving posts, railroad ties" –fence posts are at present on the free list, but appear to be specially provided for in paragraph 406 of the new bill at 10 per cent.

Senator DILLINGHAM. Where do the imported poles come from?

Mr. LANE. They all come from Canada.

Senator WALSH. How much increase under the American valuation plan would 10 per cent cause?

Mr. LANE. Senator, to give you a concrete illustration, an 8-inch, 40-foot pole—that is, one of the poles of which we get great numbers from Canada, costs in Canada as of August 1, about $7.50. On that we pay 10 per cent under the Underwood and would pay 10 per cent under the Payne-Aldrich, which is 75 cents duty on a pole of that size. A pole is a commodity on which the freight is very high. You do not have to carry it a very great distance to double the value. The overhead is high. That same pole delivered in Minneapolis would sell for about $21, and in Chicago about $22, and in New York about $26. The act provides that we must take the American valuation in the principal markets. I presume New York is a principal market. So that if the New York selling value were taken, the duty under the ad valorem rate as it is proposed here would be $2.60 on that pole as against 75 cents on the foreign value as now.

Senator SMOOT. What are the values of those poles in the panhandle of Idaho where they are cut?

Mr. LANE. The same people produce them, and they inform me, Senator, that the domestic pole produced in Idaho would sell by the producer at the same price as does the Canadian pole. I presume the American dealer, if he could get enough poles, would rather sell domestic poles, because he makes more profit on them.

Senator SMOOT. You are adding the highest freight that could be paid in the United States in order to arrive at those figures. That is not what the law contemplates.

Mr. LANE. You can produce those poles in the panhandle of Idaho just as cheap as in the forests of Canada. But the dealers invariably sell on a delivered basis. The utility companies want them laid down at destination.

I just want to call attention to the existing facts without discussing the question of whether that is too high a price or not. Those are the prices they bring, and on those prices they tell me they are not making any money now. You would have the difference between the 75 cents duty on the present basis of assessment, and $2.60 duty on an American valuation basis in New York, $2.10 on

an American valuation basis in Minneapolis. I have taken those two points.

Now, either of the American valuation bases would amount to 30 to 35 per cent duty on the foreign value of that product. I submit that a 30 to 35 per cent duty on a crude lumber product is something that even the most radical advocate of duty on crude timber has never thought of suggesting up to the present time.

Senator SIMMONS. I think Senator Smoot referred to this paragraph here, 405. As I understood your testimony, this rate being the same in this bill as it is in the present law, if the basis of valuation is changed from the foreign to the American selling price, that it will multiply that rate by three and a half.

Mr. LANE. Depending on the size of the pole—anyway, I should say from two to three and a half times.

Senator SIMMONS. I did not mean to say it would multiply the rates, but it will multiply the amount of potential protection about three and a half times.

Mr. LANE. On the pole that I cited, I think it would range from a minimum of doubling it up to three and a half times.

Senator SMOOT. You took a 50-foot pole if shipped to the very furthest point it could be shipped, and then took the American valuation at that point.

Mr. LANE. Senator Smoot, there are two sources of these poles in Canada. The red cedar district is in the intermountain district in southern British Columbia. The northern or white cedar district is in the country around Lake of the Woods along the northern boundary of Minnesota, and the northern shore of Lake Superior so far as the Canadian pole is concerned. The domestic poles, so far as the cedar poles are concerned, are nearly all produced in Montana Idaho, and some in Washington; I do not believe a great many in the latter State. So that so far as they are delivered east, my illustration are not extreme.

Senator WALSH. But if these cedar poles are produced as the Senator states and I know can be bought in Canada, and if his calculation is correct, there is going to be a great opportunity for the cedar-pol man in Idaho to make great profits in shipping to the eastern markets

Mr. LANE. I have not heard that he wants to make great profits I have scrutinized the House hearings and watched them up to date and I have not found anybody asking for any such increase in th duty on poles, unless that duty was not asked for openly.

As I say, my information is that these people who sign this petitio actually produce between 60 and 70 per cent of the poles produce in this country. They would be interested in obtaining protectio if any were wanted. But the fact is cedar poles are so scarce th the interests want poles primarily. They have a market for ever thing they can get, whether in this country or in Canada.

Senator WALSH. Do they export some cedar poles from th country?

Mr. LANE. I think there is a limited exportation to Canada, bu of course, Canada supplies poles largely from her own forests; i fact, high freight rates are the best protection to the producers o either side of the line.

Senator MCLEAN. Is not chestnut used to supply the easter markets?

Mr. LANE. To some extent, but the supply is becoming very, very limited; and the southern pine and cypress, which supplies the southern markets, is not to any great extent sent north, because I understand from the experts that that is not a wood that stands up well under the climatic conditions.

Senator WATSON. These rates provided here are precisely the same as under the act of 1913?

Mr. LANE. Yes, Senator.

Senator WATSON. How have they done any injury? There have been no imports of any consequence.

Mr. LANE. The injury they have done is this—I was coming to that, but I will deal with it very briefly. Of course, the excessive nature of any ad valorem rate, I presume, might be corrected by a modification of the rate. I hope I have made it plain that 10 per cent on American valuation is two or three times the foreign valuation; but the ad valorem rate, owing to valuation difficulties, has been a deterrent, has not produced revenue, and has kept out the Canadian poles.

Senator SMOOT. You want free poles?

Mr. LANE. We think they ought to be free, but these interests have no objection to paying a reasonable specific rate, and I think it would be very short-sighted legislation not to make them free.

The CHAIRMAN. Do you represent the building companies or the pole producers?

Mr. LANE. I represent the pole producers and dealers. I will file some petitions from the utilities companies, but their interest is to have them free. We are not vitally concerned with that.

I want to say this about the ad valorem rates: It has been productive of endless confusion and constant litigation and great hardship. It has been a constant irritant to the trade; the duties collected have never exceeded apparently an average of $30,000 a year, and the statistics show that they decreased about two-thirds in the period between 1911 and 1918. Some of the pole people have informed me that they have stopped shipping on account of appraising difficulties. Very briefly, those appraising difficulties result from this: About 75 per cent of these poles in Canada are bought under contract by the large dealers at prices that are fairly uniform, because they are competitive, and represent large quantities; 75 or 80 per cent are bought that way. There are about 15 per cent of them which represent spot purchases, usually made by contractors short of poles who have to make delivery, and they go up to Canada and pay any price the producer asks—maybe over 100 per cent above the prevailing contract price.

Senator WATSON. How long would it take you to exhaust the American supply at the present rate of consumption?

Mr. LANE. On that point, Senator, I would like to read just a very brief paragraph from the report of the Forest Service of the United States Department of Agriculture, made in response to Senate resolution 311, passed in February, 1920. This report is dated in June, 1920. I will omit everything immaterial, and read from page 23 of that report:

Of the Rocky Mountain States only western Montana and Idaho now produce poles above their needs, and can increase their output in the near future.

The western red cedar is now being cut intensively in Montana and Idaho for poles, piling, posts, and shingles. The regions which are now being exploited will probably be exhausted within the next 20 years, and operations will be transferred to more remote areas. The present cedar lumber prices have diverted into lumber a large proportion of the material ordinarily manufactured into posts and shingles. A continuation of this demand might easily exhaust the entire available supplies of post and pole material in 20 years.

The forests of Michigan, Minnesota, and Wisconsin are, I understand, practically depleted of poles now.

It takes 150 years to grow a 30-foot pole in Michigan and from 75 to 100 years to grow the same pole in the northwestern part of the United States. It appears certain that even at the present rate of consumption, the domestic supply will be exhausted in the life of this generation. The demand is equally certain to grow enormously. Congress has recognized the vital interests of the public in cheaper electricity by passing the water power act last June, and the pole people anticipate under that act an enormous increase in the demand for cedar poles for power transmission purposes. They are the standard pole; they are easier to handle, lighter, have longer life in the ground, are safer for the linemen to climb and are the standard pole and for power transmission in the Western States we must have large poles, which are getting extremely scarce in this country; I mean poles 35 feet and longer.

Senator WATSON. For long transmission lines are not steel poles principally used?

Mr. LANE. I do not think it is correct to say "principally." They are to a large extent. Two-thirds of the poles in use in this country are cedar poles.

Senator WATSON. For long distance transmission?

Mr. LANE. There is a considerable amount of the steel construction, and that is competing to some extent with the cedar poles, but it takes a pretty heavily financed interest to be able to put up that steel construction.

Senator SMOOT. Mr. Lane, I am informed, since you made your statement in relation to the American valuation on poles from Canada and specific reference to the poles being shipped to New York with a freight rate making this rate two or three times the present rate——

Mr. LANE (interposing). Freight and overhead, Senator, I should say, and, of course, there is some additional profit.

Senator SMOOT. Under the American valuation plan as virtually agreed upon by the majority members of this committee, the freight would be deducted in that case from it, and there would be hardly any difference on your poles.

Mr. LANE. Senator, I want to call your attention to just this feature of it: I have read your plan very carefully. Your primary requirement is that the foreign pole shall pay the same duty as the pole of the same kind produced in this country, and a pole from northern Idaho would sell in New York at exactly the same prices I have quoted.

Senator SMOOT. That is not what it is. It is the pole in Idaho. It is where it is produced, and that is the market price.

Mr. LANE. If that act is going to say that, I grant you it is a very different proposition.

Senator SMOOT. This is the ruling and has been under the present law, that if you place your order in New York, then, of course, the freight would be added. But if the order is placed in Montana or Idaho, no freight would be added. The American valuation would be just what it was in Idaho and Montana.

Mr. LANE. Of course, the order would probably be placed, as a practical matter, either in the New York office or in the Chicago office, or in the Minneapolis office of one of these large distributing pole concerns.

Senator SMOOT. If they had to pay twice or three times the amount of duty, the order would not be placed there; it would be placed with the manufacturer at the point produced.

Mr. LANE. If the ad valorem rate is to be continued, we welcome any clarification of the statute that would relieve us from the present implication that the principal market would be in New York or Chicago; which even under the most favorable circumstances would double the duty at 10 per cent.

Senator SMOOT. Not under the proposed arrangements, we would not.

Mr. LANE. Unless you took the value of the Idaho pole in the woods. That is not the selling price.

Senator SMOOT. How much freight did you add there to the $7.50?

Mr. LANE. I gave you the total prices as given to me, and I am not able to analyze this personally.

Senator SMOOT. I can analyze it if you will hand it to me.

Mr. LANE. I just had a memorandum of it here, Senator. Here, Senator [handing paper to Senator Smoot].

Senator SMOOT. Yes; that is what it is.

Mr. LANE. Those figures right here are given for three poles. I would be very glad to request the pole people to supply you with full details of that matter. I do not think they desire to suppress anything or obtain anything that is not entirely fair.

Senator SMOOT. The only desire I have is that the record be correct as to what difference there would be, and I did not want your statement to go unchallenged.

Mr. LANE. I want to get it right.

Senator SMOOT. When the man who administers this law and virtually has it in charge advised me that the statement made by you would not be the result as it would be administered, I thought the record ought to show it.

Mr. LANE. I want to be corrected if I am not right.

Senator SIMMONS. But, in any event, it is double?

Senator SMOOT. It would not be; it would not be any different.

Mr. LANE. Unless you take the value on the siding or in the boom where it was cut, it would be.

Senator SMOOT. That is what you have got to do in Canada; that is what we do here.

Mr. LANE. I want to say, Senator, that that is practically contrary to the contention the administrative officers are making even at present with respect to Canadian poles; they are contending that resale prices at delivered points are the dutiable values.

Senator WALSH. If that is insisted upon, this American valuation plan in any instance will not mean anything, if they do not take the value at the place of delivery?

Mr. LANE. In cheap and heavy commodities it is perfectly obvious that the freight will double the value.

Senator SMOOT. The importations come to New York, and that is the market; they purchase in New York, and the American valuation will apply to that as against any foreign country.

Mr. LANE. Of course, Senator, these pole people have selling offices in every principal city.

Senator WALSH. On something produced in the West the American valuation must be what that article is worth in New York, plus the rate fixed to protect American labor. It is to take care of the difference in labor in America and Europe.

Senator SMOOT. That is as to the amount of duty, but not as to the American valuation; and there is a difference of opinion as to whether that difference for freight should be taken care of even by protective duty, and there had to be some limit to that. But that does not affect the American valuation.

Mr. LANE. I am willing to concede, then, Senator Smoot, in order to simplify the record, that if the producing point be in the woods of northern Idaho, at a price in the boom or on skids or on a siding opposite the railroad track—if those production prices were taken as dutiable value, it would be substantially the same as the Canadian value just across the line. But we do not see how under the law any such value can possibly be taken, and we do not believe it will be taken by the administrative officers, unless you instruct them specifically in that law to take the value at the point of production.

Senator SMOOT. Of course, you said "delivered at Minneapolis."

Mr. LANE. That is the selling price delivered.

Senator SMOOT. Of course, that is the price and all in it?

Mr. LANE. Yes, sir.

Senator SMOOT. I understood you to say the freight.

Senator SIMMONS. You do not think in ascertaining the American market value for wheat, that you would take the farmer's price on the farm. But you would rather take the price at some central market where wheat is bought and sold in large quantities.

Mr. LANE. If it is taken in the central markets, it will include the freight and profit at that market. That is a very different thing from the producing price at the point of production. I do not interpret this statute as it now reads as justifying anybody in going back to the point of production, unless that happens to be the market.

Senator SMOOT. If it was purchased there it would be the price, but if it is not—if you want to pass through New York or Chicago—it would not be.

Mr. LANE. As a practical matter, these things are sold through distributing agencies all over the United States, and they are sold at delivered price as the customer wants it that way.

But if I may, very briefly, in closing, state this: The pole people would like very much to get together with a subcommittee of this committee or any subcommittee on the question of the ad valorem rate and the duty which is to be applied, if the committee desires, but we earnestly hope that you will depart from this ad valorem principle. As I say, it has collected no revenue, but has been a source of constant trouble. We appreciate the difficulties of the appraising officers. A carload of poles will come across the line to-day at a

contract price, purchased under one of these large contracts, and the next day some spot purchaser will come over and buy at a value 100 per cent higher. The appraising officer promptly advances the price on the first shipment and that raises a controversy. We are confronted with that all the time. Practically every one of those controversies have been decided favorably to the large pole interests, up to date, but we have been in court constantly for three years.

Senator SMOOT. What you want is free poles, and if you can not get free poles, you want specific duty?

Mr. LANE. We would be satisfied with a specific duty, but we think they ought to be free.

Senator SIMMONS. I want to understand Senator Smoot. Do I understand you, Senator, to contend that the American value, for the purpose of applying the tax, will be one thing at one port of entry and another thing at another port of entry?

Senator SMOOT. I did not say that at all. I said if those poles were purchased direct from the producer of poles in the panhandle of Idaho or Montana that the freight, whatever it would be—if it was to New York—would cut no figure whatever, because that would not be taken into consideration. If somebody in New York needs these poles and has a firm in New York purchase them, and send the order out to Idaho, then New York would be the point of purchase.

Senator SIMMONS. I supposed it did not make any difference where the order was given, but that to ascertain what was the American selling price by some rule you would lay down that valuation would be the same throughout the whole United States. If it does not mean that, it is a very awkward proposition to say the least of it.

Senator WATSON. The witness has had 30 minutes.

The CHAIRMAN. I think so.

Mr. LANE. If I may state very briefly my suggestion as to specific rates. We have suggested that poles be put in paragraph 401, with round timber used for spars or in building wharves at one-half of 1 cent per cubic foot; we have also suggested that you put them in paragraph 402 providing for logs of cedar dutiable at a dollar a thousand with exemption, if no export restriction is imposed by the country of origin. These are nothing in the world but cedar logs—a logging operation.

The CHAIRMAN. You have all this in your brief, have you not?

Mr. LANE. We have suggested that it be put in 1683 of the free list, where we think they really belong, because all that we can produce in this country plus all that we can get from Canada will not supply our domestic wants.

The CHAIRMAN. You want your brief printed, do you?

Mr. LANE. I have a printed brief; I should like to have it printed.

The CHAIRMAN. It will be printed as a part of Mr. Lane's remarks.

Mr. LANE. I would also like to submit, if the chairman please, a number of letters from the public utility companies dealing with the pole situation.

The CHAIRMAN. I do not think the committee cares to print letters. We will have to bar them. You make the statement for the utility companies, we understand.

Senator WALSH. Make a statement in a paragraph naming the companies.

The CHAIRMAN. You can state the companies.

Mr. LANE. I have letters from the Consumers Power Co., of Jackson, Mich.; the Cities Service Co. (Henry L. Doherty Co.), New York. N. Y.; Union Gas & Electric Co., Cincinnati, Ohio; General Utilities & Operating Co., Washington, D. C.; Louisville Railway Co., Louisville, Ky.; and the Georgia Railway & Power Co., Atlanta, Ga.; and there are probably numerous others that have not been sent to me, calling the attention to the great scarcity of poles in this country and the difficulty of getting satisfactory poles and the need of making the Canadian supply available to consumers.

The CHAIRMAN. You will doubtless realize we get a good many letters ourselves.

Mr. LANE. There is no doubt about that, Mr. Chairman. We cut from our woods 3,500,000 to 5,000,000 poles every year, young trees that have not reached maturity.

BRIEF OF T. M. LANE, NEW YORK CITY, REPRESENTING THE CEDAR POLE INDUSTRY.

The undersigned are dealers in cedar poles used for telegraph, telephone, electric light, trolley, and power transmission purposes, and respectfully petition your committee and Congress to remove from such poles the ad valorem duty, which has been the cause of endless confusion, litigation, and hardship, and to give these commodities their natural classification with round timber, which, under the pending bill, is either exempt from duty or dutiable at specific rates. (See pars. 401, 402, 1683, H. R. 7456.)

Telephone, trolley, electric light, and telegraph poles of cedar or other woods are made dutiable at 10 per cent upon American valuation by paragraph 405 of H. R. 7456.

Following is a summary of the reasons for requesting this change in the law:

1. The ad valorem duty on poles has raised very little revenue in the past and promises to raise none in the future upon the basis proposed.

These poles were dutiable at 10 per cent ad valorem on foreign valuation under the Payne-Aldrich tariff of 1909 (par. 204) and at the same rate on foreign valuation under the Underwood tariff of 1913 (par. 170). This duty has been so difficult of administration that it has proved a serious obstacle to importations and has raised very little revenue.

The publication entitled "Statistics of Imports and Duties," prepared for the use of the Committee on Ways and Means, gives the value of and duties collected upon imports of paving posts, railroad ties, telephone, trolley, and electric light poles, from 1911 to 1918, inclusive, as follows:

[Rates of duty, 10 per cent.]

Fiscal year.	Values.	Duties collected.	Fiscal year.	Values.	Duties collected.
1911	$1,014,112	$101,411	1915	$225,030	22,503
1912	775,587	77,558	1916	145,799	14,759
1913	511,219	51,121	1917	351,603	35,160
1914	409,449	40,944	1918	347,910	34,791

The duties collected on poles are not stated separately from the duties on paving posts and railroad ties, and the duties on posts and ties undoubtedly form a substantial portion of the above totals. These figures demonstrate that, at the rate of 10 per cent ad valorem, the amount of revenue collected upon poles has been unimportant.

It will also be noted from the above tabulation that the duties collected on the commodities named decreased about two-thirds in the period between 1911 and 1918. This was doubtless due in large measure to the restriction imposed upon importation by the peculiar and intolerable difficulties, hereinafter discussed, attending the administration of an ad valorem rate upon poles.

Under H. R. 7456 the ad valorem rate of 10 per cent imposed for the last 12 years on foreign valuation is continued, but is made payable upon the American valuation

of the poles. This forms a striking exception to the general policy of the bill, which has been to decrease the ad valorem rates to compensate for the increased value under the American-valuation plan. The result will be an increase over the amount of duty collectible on poles under the Payne-Aldrich and Underwood tariffs in excess of 100 per cent.

Poles are a cheap commodity on which the freight is high. A pole does not have to be transported a very long distance to increase its value 100 per cent on account of the freight charge. We thus have a situation where the Government presumably will collect half or more of its duty on the element of freight expense.

Poles are generally sold in this country at a price delivered at destination and, naturally, selling prices in the United States are as varied as points of delivery. A green pole, worth no more to the dealer than a seasoned pole of the same length and diameter, sells for considerably more delivered at destination on account of its heavier weight. In filling large orders it is difficult to obtain the necessary quantity of seasoned poles and green poles must often be shipped, so that the same commodity in the green state, and intrinsically no more valuable than a seasoned pole, will have to pay a much higher amount of duty.

The proposed law furnishes no rule for determining which of the widely varying prices charged at points of delivery in the United States must be selected for the purpose of entry and appraisement at the customhouse. The difficulties of declaring the correct American valuation for this commodity, under section 402, are beyond solution.

Furthermore, the supply of cedar poles is so limited in the United States that any increase in duty would immediately raise the price of domestic poles, resulting in a still more formidable duty on Canadian poles. Even without any advance in the price of domestic poles, the enormous increase effected by shifting the same rate as imposed heretofore from the basis of foreign to American valuation, thus doubling the duty, will certainly mean the complete extinction of the trade in Canadian poles at a time when our domestic needs imperatively demand that the Canadian supply be made available to consumers in this country.

2. The destruction of immature trees is a menace to our forests.

The cutting of millions of small trees every year before they reach their maturity of growth, usefulness, and value is contributing heavily to the destruction of our forests and requires that the supply be enlarged before the demand becomes heavier.

The annual consumption of poles is estimated at quantities ranging from 3,500,000 to 5,000,000 poles, 95 per cent of which are cut from our own forests. It takes 150 years to grow a 30-foot pole in Michigan and from 75 to 100 years to grow the same pole in the northwestern part of the United States. The Forestry Department of the Federal Government has estimated that the privately-owned supply of cedar poles in the northwestern United States may be exhausted in 20 years. The cedar forests of Michigan, Minnesota, and Wisconsin have been largely depleted, long poles having almost disappeared and the supply of short ones becoming more and more limited. Long poles, i. e., poles 35 feet and upward in length, are a necessity for power transmission purposes, which is to say that they are indispensable to the proper development of our hydroelectric power.

3. The treatment of cedar poles in H. R. 7456 is inconsistent with the treatment of other round timber and opposed to the general legislative policy favoring free timber.

In every tariff act since 1870 logs and round unmanufactured timber have been placed upon the free list. This policy is continued in H. R. 7456. Under paragraph 15[illegible] of the bill "logs and round, unmanufactured timber" are still on the free list. While paragraph 402 expressly names cedar logs and imposes a duty of $1 per thousand feet board measure, the proviso to the paragraph makes such logs free if imported from a country imposing no export restrictions on this class of logs. It is obviously intended that no duty shall be imposed on timber in the form of cedar logs.

The treatment of cedar poles in H. R. 7456 is strikingly inconsistent with the treatment of other round timber.

Paragraph 405 of H. R. 7456 expressly provides for "telephone, trolley, electric light and telegraph poles of cedar or other woods," at a duty of 10 per cent on American valuation. These poles are nothing but small logs of cedar; that is to say, they are round cedar timber.

Paragraph 401 of H. R. 7456 imposes upon "round timber used for spars or in building wharves" a duty of one-half of 1 cent per cubic foot. Precisely the same cedar log as that used for a pole may be also used for piling in wharf building. The inconsistency is obvious of assessing a cedar log at only one-half of 1 cent per cubic foot when used for wharf building and at the very much higher rate of 10 per cent on the American valuation of such log when it is used for a wire-carrying pole. Considerable confusion seems also inevitable to determine the classification as between paragraphs

401 and 405 wherever there is a competing use for piles as against use for poles. It is equally inconsistent to assess round timber for spars, a very much more valuable product than a pole, at the lower rate of one-half of 1 cent per cubic foot.

As already seen, paragraph 402 of H. R. 7456 makes "logs of * * * cedar," dutiable at $1 per thousand feet board measure, with a proviso making such logs free of duty if no export restrictions are imposed by the country of origin. This proviso will undoubtedly have the effect of making cedar logs free. It follows that full grown cedar logs will pay at the most $1 per thousand feet and will in all probability be exempt from duty under paragraph 402. Such logs will compete with similar mature timber from our own forests, and properly so, for the soundest reasons of conservation. But a small cedar log such as can be used for a pole will be assessed at the prohibitive rate of 10 per cent on American valuation, under paragraph 405. With the Canadian poles thus shut out there will result an increased destruction of the small timber which should be left standing in our own forests to maturity.

A duty upon cedar poles, enumerated as such, was imposed for the first time in 1890, since which time there has been a decided change in the status of the domestic supply. The tax on poles has been a striking exception to the settled general policy in favor of free timber, which doubtless has had for its basis the conservation of our forests as well as the exemption of the raw material for our lumber mills. If there ever was a reason for the taxation of round timber used for wire carrying, it has disappeared in the light of present-day facts regarding the depletion of our small standing timber and the failure of reforestation to keep pace even approximately with the destruction.

There can be no justifiable reason for tariff protection of domestic cedar holdings. The best protection to the American producer is the high freight charge on Canadian poles. Only about 5 per cent of the poles used in this country are imported. The Tariff Commission's report to the Committee on Ways and Means shows that 95 per cent of the poles used in this country are of domestic production. (Summary of Tariff Information, 1920, p. 276.) The signers of this petition include large domestic producers who would be interested in obtaining protection if it were necessary or desirable.

There is no question of competition with manufactured lumber. The production of poles is a logging operation. The only work done in Canada on the poles is that which has to be done in the woods to produce a stick of timber such as would clearly fall within the exemption of round unmanufactured timber, as construed by the courts, were the commodity not expressly designated as dutiable. All of the other processes adapting poles for use as wire-carrying poles, such as notching, and fitting with crossarms, squaring, roofing, creosoting, etc., are applied in this country.

4. Conditions that attend the administration of an ad valorem duty are peculiarly burdensome and embarrassing in the case of poles.

Probably 75 per cent of the total importations of poles are bought in Canada under contract at prices which are fairly uniform for a given time, and the contracts and records of the dealers have always been open to the Government. There are, however, always a number of spot purchases being made by contractors and others in the United States who must have poles for immediate delivery and are willing to pay almost any price for a few carloads. These spot purchases will sometimes run nearly 100 per cent above normal contract prices and are subject to violent fluctuations.

The regular contracting buyer can not possibly know what the occasional buyer, who is short of poles, may have paid, and the widely variant prices are extremely bewildering to the customs officials. For the greater part of the last three years the situation has been almost chaotic.

The difficulties from the standpoint of the appraising officials are fully appreciated and it would seem that the small amount of revenue collected did not justify the burden of uncertainty in the matter of dutiable value which has rested both upon the customs officials and upon an important and essential industry. It is probable that considerable amount of the revenue collected has been consumed by the expense to the Government of investigating and testing values.

These problems will be intensified by the application of American valuation to this commodity, owing to the widely varying prices at points of delivery. In the opinion of petitioners, it will operate as a complete barrier to the importation of Canadian poles.

5. Changes recommended in the provisions of H. R. 7456.

Having in mind the pressing needs of this country in the immediate future, petitioners are profoundly convinced that the imposition of any duty on this product would be unwise. They accordingly urge that poles be placed unconditionally upon the free list.

To accomplish this unconditional exemption of poles they suggest that paragraph 405 of Schedule 4 be amended so as to exclude the matter italicized in the subjoined quotation of the paragraph:

"PAR. 405. Paving posts, railroad ties, *and telephone, trolley, electric light and telegraph poles* of cedar or other woods, 10 per centum ad valorem."

The above change should be supplemented by amending paragraph 1683 of the free list so that it will expressly include such poles, by addition of the italicized matter below:

"PAR. 1683. Wood: Logs and round, unmanufactured timber; *telephone, trolley, electric light, telegraph and power transmission poles of cedar or other woods;* firewood, handle bolts, shingle bolts, gun blocks for gunstocks, rough hewn or sawed or planed on one side, sawed boards, planks, deals, and other lumber, not further manufactured than sawed, planed, and tongued and grooved; clapboards, laths, ship timber; all of the foregoing not specially provided for: * * *."

If your committee decides that some duty should be imposed then we earnestly request that it may be determined upon a specific duty basis.

We submit that a very simple solution of the problem of imposing a specific rate can be arrived at by classifying these poles with "round timber used * * * in building wharves," now provided for in paragraph 401 of H. R. 7456 at a specific rate of one-half of 1 cent per cubic foot. Since, as already stated, the same cedar logs that are used for poles are also used for piling, this would tend to greater consistency of legislation and avoid litigation on the question of classification. To accomplish this paragraph 401 should be amended by the addition of the italicized matter as indicated below:

"PAR. 401. Timber, hewn, sided or squared otherwise than by sawing (not less than eight inches square), round timber used for spars or in building wharves, *and telephone, trolley, electric light, telegraph and power transmission poles of cedar or other woods,* one-half of 1 cent per cubic foot."

A further method of imposing a specific rate with conditional free entry can be effected by classifying poles with other "logs of, * * * cedar" in paragraph 402 of H. R. 7456. That paragraph as modified would then read as follows, new matter being in italics:

"PAR. 402. Logs of fir, spruce, cedar, or western hemlock, and *telephone, trolley, electric light, telegraph and power transmission poles of cedar or other woods,* $1 per thousand feet board measure: *Provided,* That any such class of logs *or poles* cut from any particular class of lands shall be exempt from such duty if imported from any country, dependency, province, or other subdivision of government which has, at no time during the twelve months immediately preceding their importation into the United States, maintained any embargo, prohibition, or other restriction (whether by law, order, regulation, contractual relation or otherwise, directly or indirectly) upon the exportation of such class of logs *or poles* from such country, dependency, province, or other subdivision of government, if cut from such class of lands."

If either of the last two suggestions are adopted the provision for poles should be stricken from paragraph 405 as first above proposed.

In suggesting that cedar poles be classified with other logs and round timber, petitioners do not indorse the proposal to put either logs or poles upon the dutiable list as they believe that they should be free without condition.

6. Free entry is the logical and effective relief.

Not only the conservation of our forests but the development of electrical power will be subserved by the free entry of Canadian cedar poles.

The interest of the public is vital in cheap electricity and low telephone and telegraph rates. Poles form a heavy item of the investment of public utilities and carry equipment forming a much larger investment. The necessity of obtaining poles with strength and lasting qualities at the lowest possible cost is great. The cedar pole supplies these requisites and is the standard pole for carrying electric wires. It has long life in the ground, symmetry, strength, is less dangerous to linemen in all kinds of weather, can be easily climbed and is lighter and cheaper to handle. At least two-thirds of the poles in use in this country are of cedar. A very large proportion of the poles imported from Canada are used by the power companies for transmission purposes.

The present rate of consumption will probably exhaust the domestic supply of cedar poles within the life of this generation. The demand will grow enormously with the advance of the program of electrical development, under the encouragement of the new water power act and the necessities arising from our diminishing coal supply. Under the water power act of June 10, 1920, we are promised, in a recent article written by the executive secretary of the Federal Power Commission, that "a new era is ahead in the development of electric power and its wider distribution and more intensive application in industry and transportation." The only cedar poles imported come from Canada and all that can be imported when added to those produced in this country will hardly supply the demand resulting from our constantly increasing consumption.

Under all the circumstances we submit that the interests of the Government, the consumer, the general public and the conservation of our resources will be best subserved by a complete removal of the duty on poles and that the minor loss of revenue will be more than compensated by the economic gain.

The undersigned petitioners believe it conservative to state that they handle and market at least 85 per cent of the cedar poles produced both in Canada and the United States.

CEDAR SHINGLES.

[Paragraph 408.]

STATEMENT OF GEORGE A. BERGSTROM, REPRESENTING THE PACIFIC TIMBER CO., OF EVERETT, WASH.

Senator McCUMBER. Congressman Johnson, I believe you were jus now attempting to see if you could get several of these witnesses wh desire to speak upon the shingle industry to select one man, if possible to cover the same subject.

Mr. JOHNSON. Mr. Chairman, I would like to have you hear two o them and let the third man have permission to enter an appearance We would also like permission to file briefs. I would like to file on in opposition to this theory that is being so widely agitated b pamphlets that a tariff on lumber, like a tariff on oil, is a blow at th conservation of American resources. I shall not take up the time o the committee in an attempt to show that those who advance idea with respect to saving privately owned timber for posterity is a mis take. It can not be saved that way. It is what we live on. Yo will not conserve it by letting Canadian or other timber come in You will force good timber to go into railroad ties and put our saw mills out of business.

I would like to call Mr. Bergstrom to make a statement with refer ence to the tariff on shingles, which has been placed at 50 cents pe thousand. We would have preferred to have had that tariff at 6 cents per thousand. I would like to have the committee interrogat Mr. Bergstrom with regard to Canadian timber, their Crown-lan system, their leasing plan, and their embargo scheme, all of which ar used to the detriment of the American industry and none of whic benefit the American consumer.

Mr. BERGSTROM. Mr. Chairman, I represent the Pacific Timbe Co., of Everett, Wash., manufacturers of red-cedar shingles.

I do not know that I have much to say in addition to my testimon that was given before the Ways and Means Committee of the Hous last January. I shall be brief. In that connection, however, I wi say that the predictions and prophecies that we made at that tim have actually come to pass. We can not compete with Briti Columbia mills under severe competition. Our company operate two mills. It has an investment of about $200,000 and employs 10 men, all Americans, and practically all married, and most of the owning their own homes. On account of our inability to secure th

raw material at a satisfactory price, we have been shut down since the first of this month, while our Canadian competitors have been operating continuously, and some of them even operating night and day.

Senator SMOOT. You are speaking now of shingles?

Mr. BERGSTROM. I am speaking absolutely of shingles. I am a shingle manufacturer. At the time of closing our mills the average log cost of British Columbia mills on cedar was $16 delivered at the mill, while our average cost was $18 base, or an average of $19. This made operation of our mills impossible under existing conditions, as this to-day practically means a differential in their favor of $3 a thousand for the raw material.

Senator SMOOT. What are you asking for on shingles?

Mr. BERGSTROM. Fifty cents per thousand.

Senator SMOOT. That is provided for in the bill.

Mr. BERGSTROM. Yes.

Senator SMOOT. That is satisfactory to you?

Mr. BERGSTROM. That is satisfactory.

Senator WATSON. Is anybody opposing that?

Mr. BERGSTROM. I do not know. We were told to appear here.

Senator SMOOT. We have not heard of any opposition.

Senator WATSON. I am wondering why you are bolstering up a case that nobody was attacking.

Mr. BERGSTROM. I do not know whether there is opposition or not. We were notified to appear here. We did not care to make this trip from the West coast here, traveling 3,000 miles, unless it was necessary.

Senator SMOOT. No one has been asked to appear.

Mr. BERGSTROM. We were notified on Saturday to leave Sunday morning, as arrangements had been made to appear before the committee Friday, August 26, and I certainly did not want to take this long trip unless it was necessary.

Senator McCUMBER. However, you are aware of the very widespread demand for free lumber and free building material, and it is in anticipation that that might have some influence that you are down here?

Representative JOHNSON. I think that is exactly it. Cedar trees stand in the woods about one to eight or ten. Cedar trees are logged along with spruce and fir. They come off together. Now, to attempt to keep all the fir timber of the Pacific Northwest standing for our children's children will make it impossible to get out the cedar logs. To-day the Canadian shingle business as against the American business has increased from $1,700,000 value to this country, shipped, to over $12,900,000; that is, Canadian shingles in our market. And as far as I am concerned I agree with the two Senators who have spoken—I have heard of no opposition to this 50-cent tariff. I would like to take time to speak to the committee with regard to making it 60 cents.

Senator McLEAN. Just one question. I suppose these cedars grow in with the Douglas fir?

Representative JOHNSON. Yes.

Senator McLEAN. Without indicating any opposition to adequate protection for the shingle industry, I assume that the conservationists

claim that both the fir and the cedar should be left uncut and conserved?

Representative JOHNSON. I suspect that.

Senator McLEAN. What have you to say to that?

Representative JOHNSON. It seems to be a fact, from what figures I can get, that the States of Oregon and Washington have more standing timber of all species suitable for manufacture than the entire Dominion of Canada——

Senator McLEAN. Is that true?

Representative JOHNSON. Yes; with the single exception of red cedar. Red cedar in the Province of British Columbia amounts to 125,000,000,000 feet as compared with 25,000,000,000 feet remaining in the State of Washington and 12,000,000,000 feet remaining in the State of Oregon; that is to say, British Columbia has more good cedar standing than we have. But I will leave this to any business man as to how you can conserve timber by requiring private owners not to cut timber, either cedar or spruce.

Senator SMOOT. Mr. Bergstrom, are you satisfied with paragraph 408 as it stands?

Mr. BERGSTROM. Yes.

Senator SMOOT. Then you have no objection to the paragraph as written?

Mr. BERGSTROM. I have no objection to the paragraph as written, Senator.

Senator SMOOT. In the balance of the time allotted to you will you kindly make a statement to the committee in relation to the embargo that Congressman Johnson referred to?

Mr. BERGSTROM. In June of this year I made a special trip to Vancouver, British Columbia, with the object of buying cedar logs. At that time they were selling at $16 delivered at Vancouver, while our logs were averaging around $19. I was in a position to buy cedar logs from the loggers in British Columbia at $17, Canadian money, delivered in Anacortes, Wash. Seventeen dollars Canadian money at that time would have amounted to about $15.30 American money. My tow from Anacortes to Everett is 90 cents. Those logs would have cost me $16.20 delivered as against $19 for American logs. I was prevented from buying these logs on account of the embargo. The Canadian Government would not allow the exportation of those logs.

Senator McCUMBER. Why?

Mr. BERGSTROM. They practically maintain an embargo at all times on cedar.

Senator McCUMBER. But why?

Mr. BERGSTROM. I do not know.

Senator SMOOT. Were they Crown lands?

Mr. BERGSTROM. No.

Senator SMOOT. Were they privately owned lands?

Mr. BERGSTROM. They were what they call licensed lands.

Senator SMOOT. Well, then, they were grant or Crown lands?

Mr. BERGSTROM. No; the grant and Crown lands are different from those lands.

Senator McCUMBER. Those are Canadian public lands?

Mr. BERGSTROM. Yes.

Senator McCumber. Under their law allowing leases they do not allow any exportation of the logs themselves, do they?

Mr. Bergstrom. Crown grant lands comprise about 6 per cent of the standing timber in British Columbia and are exportable at any time.

They defend their position on the embargo with the statement that they are preserving their own timber for their own manufacturers, but, at the same time, while they maintain that embargo against the American manufacturers they are shipping logs and bolts to Japan. In other words, they are protecting their own Canadian manufacturers on the cheaper raw material as against the American manufacturers on their higher priced raw material, because 80 per cent of their finished product is sold in the United States in direct competition with the American manufacturer.

When I was there in June I also investigated labor conditions. They were paying \$3.60 for white labor, base price, for 9 hours' work, or 40 cents an hour. We were paying \$3.60 for 8 hours, or 45 cents an hour. Other white labor was paid in proportion. Oriental labor was considerably cheaper.

Senator McCumber. How about the efficiency of their labor as compared with ours?

Mr. Bergstrom. They claim that the white labor is more efficient than the oriental labor. If that is true why do they hire oriental labor?

Senator McCumber. Are they paying the same price for the oriental labor that they pay for the white labor?

Mr. Bergstrom. No; they pay less for oriental labor than for white labor.

Senator Smoot. Where do the shingles exported from America go?

Mr. Bergstrom. We do not export very many shingles. A few of them have been shipped to Honolulu.

Senator Smoot. Those would not be exports. I mean the foreign countries. For the year ending June 30, 1920, we exported \$153,972 worth; and for the year ending June 30, 1921, we exported \$157,784 worth. I thought may be you knew where those exports went.

Mr. Bergstrom. Our entire output is disposed of in the States.

Senator McCumber. What percentage of the value of your product constitutes labor itself?

Mr. Bergstrom. Our labor will run around 75 to 80 cents per thousand. Our overhead, covering office force, supplies, insurance, taxes, etc., will run around 40 to 50 cents.

Senator Smoot. What proportion is that of the whole?

Mr. Bergstrom. That would be about 65 per cent.

Senator McCumber. In other words, the value of your stumpage would be about 35 per cent and the balance constitutes labor and expense?

Mr. Bergstrom. No.

Senator McCumber. We want to get it in percentage.

Mr. Bergstrom. I did not include the value of the stumpage raw material (cedar logs) at all. I was talking about labor and overhead in the operation of our mills without the raw material.

Senator McCumber. What I want to get is what percentage of the value of your product is taken up in labor and other expenses outside of the stumpage value of your cedar, if cedar is what you use.

Senator SMOOT. Take a thousand shingles. What was the price per thousand shingles?

Mr. BERGSTROM. We will take $2.60 for ordinary grade clears.

Senator SMOOT. $2.60 a thousand?

Mr. BERGSTROM. Yes.

Senator McCUMBER. That is your selling price?

Mr. BERGSTROM. That is our selling price.

Senator SMOOT. Of that amount how much is labor?

Mr. BERGSTROM. About 30 per cent, as far as our own operation is concerned.

Senator McCUMBER. And what is the balance?

Mr. BERGSTROM. There would be about 30 per cent labor, about 20 per cent overhead, and about 50 per cent raw material. That is not exact, of course, although I can give you the exact figures later.

Senator McCUMBER. Where do your profits come in?

Mr. BERGSTROM. There are no profits to-day.

Senator McCUMBER. You are figuring, then, that on the prices to-day you are making no profits at all?

Mr. BERGSTROM. If we were not losing more money than our shut-down expense we would continue to operate, because we have a moral obligation to our employees and their families, which we must recognize if possible to do so.

Senator McLEAN. In the East we pay $7.50 to $8.

Mr. BERGSTROM. Mr. Case, what is our freight to New York to-day?

Mr. CASE. $1.20 a hundred.

Mr. BERGSTROM. The freight is $1.20 a hundred and the shingles that I was speaking about weigh 180 pounds to the thousand. You may be using the price of a different grade shingle than I mentioned; there are several grades of shingles; we make them all.

Senator DILLINGHAM. Where do you market your shingles?

Mr. BERGSTROM. Our shingles are mostly marketed in the Southwest, in Texas and Oklahoma, and throughout the Middle West.

Senator WALSH. I have a memorandum submitted to me by the Western Pine Manufacturers' Association, operating 65 sawmills in Oregon and Washington, and they are going to appear here in opposition to any tariff upon lumber or shingles. They have submitted some questions to me to ask you. One of them is, what is the difference in the cost of manufacturing shingles in British Columbia and in Oregon?

Mr. BERGSTROM. I have no way of having access to the cost sheets of the British Columbia manufacturers; but it is reasonable to expect that if they are receiving nine hours work for the same price for which I am receiving eight hours work, their cost of labor is not only cheaper, but their cost per unit on their overhead on account of increased production must also be cheaper.

Senator WALSH. So you base your reason for thinking that your cost of production is more upon the difference in hours of labor rather than the efficiency of the labor?

Mr. BERGSTROM. As I explained, they are in a position to employ practically the same labor we do. My comparison was on white labor. They prefer the cheaper oriental labor, and it must be profitable or they would not do so.

Senator WALSH. Have not some statistics been printed showing that one white man, with the machinery that is used in America, is

able to do better work and turn out more shingles than several orientals?

Mr. BERGSTROM. I do not think so. They use the same machinery in British Columbia as they do in America.

Senator WALSH. Is the oriental labor as good as the white labor?

Mr. BERGSTROM. I have never used any oriental labor, so I can not answer that question; but they use the same machinery, and they can employ white men if they want to.

Senator McCUMBER. The orientals are not hired to do any expert work at all, are they?

Mr. BERGSTROM. Yes; what they call skilled labor.

Senator SMOOT. Are they Japanese?

Mr. BERGSTROM. I do not believe I have ever seen any Japanese sawyers or packers. They use Chinese. They use Japanese for common labor.

Senator WALSH. Can you give me the actual labor cost per thousand shingles in 1920 in British Columbia and Oregon?

Mr. BERGSTROM. I can not.

Senator McCUMBER. Senator Walsh, he just went over the subject generally before you came in.

Representative JOHNSON. I would like to say that in the brief we will file we will undertake to put those exact comparative costs in. The people from my congressional district have sent representatives into British Columbia to make a study of the costs. We also undertook to find the names of the Americans who invested money in British Columbia in timber grants and timber lands for the purpose of doing business in Canada, and when we undertook to secure those names we found that British Columbia all of a sudden prohibited the publishing of any lists showing such information, although such lists had been published regularly for many years. So if there is going to be a fight from the Western Pine Association on this wood schedule or any part of it we want to be in it, and we can meet every argument.

Senator McCUMBER. Is that all, Mr. Bergstrom?

Mr. BERGSTROM. Yes, sir.

Senator WALSH. In view of the fact that the witness has covered in his testimony some of the questions that I wanted to ask him, I shall not proceed any further.

Representative JOHNSON. Mr. Case is here. He is a large manufacturer, and I think he can give you very quickly some information on this subject.

STATEMENT OF E. E. CASE, OF RAYMOND, WASH.

Senator WALSH. May I submit to you a list of questions, Mr. Johnson, and ask for answers to them?

Representative JOHNSON. Yes, sir; I shall be glad to answer, as far as I can, at your convenience.

Senator McCUMBER. Mr. Case, I wanted to ask one of your witnesses here who can answer the questions to give me some light on the subject, and I do not know but what I might as well start in by asking you questions on this subject. This last summer I had occasion to take a trip up the McKenzie River, in Oregon, where the Government, in conjunction with the State, is making a road from

Eugene, Oreg., across the mountains on the east. That road goes through the finest belt of Oregon timber—immense trees 200 feet tall, with diameters near the butt of 6 and 8 feet. They paid $1.50 on an estimated thousand for pulling those logs off of the roadway, which is 40 feet wide, and piling them up. They are chopped down and then sawed into lumber lengths and piled up 10 and 20 feet high in places. The stumps are blasted out. They are building a good, substantial road from there down to Eugene, where it connects with the Southern Pacific. I asked them what they would do with those logs; if there was any way of utilizing them after the road is completed for over 40 miles through that fine forest, and if they could not dispose of those logs.

They informed me that the logs would simply have to rot there, the finest timber that you ever saw; that labor was so high that it was even impossible to take portable sawmills up there and take the logs that were already cut into timber lengths and saw them and take them to market. If we can not, with our labor cost, take logs that do not cost anything and move them on trucks, after being sawed into lumber, a distance of 30 or 40 miles, I confess that I am unable to understand how we can protect ourselves against a market anywhere else. I would like to hear you upon that subject in order to ascertain why it is that we can not even compete with those logs, the finest pine and spruce there is in the United States, already cut, and not the cost of a penny for stumpage.

Mr. CASE. The matter of transportation is of considerable importance. If it were necessary to transport those logs 40 miles on trucks at the present price of logs, a man could not load and pile them on a truck and make his wages.

Senator MCCUMBER. Of course they would not truck the logs. If they were going to do anything, they would simply saw them into portable lumber and then, over as good a road as there is here, take them from 30 to 40 miles to market. And remember that it costs nothing for the logs; if anybody will take them away they can have them.

Mr. CASE. Your statement that these logs run from 6 to 8 feet——

Senator MCCUMBER. I did not mean to say that 6-foot logs were the smallest.

Mr. CASE. But the fact that they are large logs would almost prohibit using a temporary mill, a small sawmill. You would have to have pretty heavy machinery to handle a log 6 or 8 feet. Besides, those logs are strung out along the road for the whole 30 miles. Of course, logs of that diameter would be the most profitable in the fixed cost of the amount of clear. The amount of clear is the only thing that pays us in the manufacture—that is, if there is any such thing as paying us. To-day the lumber business is probably in as bad a way on the Pacific coast as it ever has been, due, I suppose, from the price of lumber caused by the competition all over the country. Everything is on the downward turn, and everything goes down faster than labor, which constitutes the great percentage of cost in both lumber and shingles. It is almost prohibitive to cut those logs that you speak of along the roadway in a temporary sawmill. The only way they could be utilized to any advantage would be for a man to buy some other timber. But the stumpage is not always the thing that counts. While it is a factor, the stumpage is not the only

thing that counts. It is the cost of getting the logs from the woods out, and there are some places where it costs more than others. Take a strip of timber 30 miles long and 140 feet wide. You understand that to gather up those logs the cost of transportation would be more than the stumpage amounted to, which would be two or three dollars per thousand.

Senator McCumber. When lumber was selling at about $60 a thousand, it would seem to me that there ought to be a market for those logs.

Mr. Case. That was in 1920?

Senator McCumber. Yes; in 1920.

Mr. Case. 1920, you understand, was a very abnormal year. Not only was the lumber high, but wages and everything that entered into our costs were the highest ever known. Our labor and supplies and everything else were higher during 1920 than they were in any other year.

You asked if there had been any opposition. We know that there is opposition. We know that there is going to be a fight, and we know where the fight is going to come from. That is why I am here to-day. I did not appear before the Ways and Means Committee. Mr. Johnson has stated to you that we want to file a brief. We are going to give you the exact figures of the cost of manufacture of shingles in British Columbia and in Oregon and in Washington. We will also give you the names of the mills. It will be no general proposition. We will give you the names of every shingle mill we can cover, so that you will know where they come from, and you can then go back and check us up.

Senator McCumber. The main trouble now is due to labor and transportation?

Mr. Case. Yes, sir.

Senator McCumber. And the labor in the cost of transportation is responsible for the high transportation costs?

Senator Walsh. Does not labor cost the same, whether lumber comes from British Columbia or from Oregon to the East?

Mr. Case. To a certain extent the transportation cost is the same. When shingles are shipped from Vancouver to Montreal and down into Massachusetts—the State that you are from, Senator Walsh—the cost to the Canadian manufacturer is less than it is to the American manufacturer, because they ship them by the way of Montreal, and there is no war tax charge, only from the United States to the line, and the excess war tax would only apply from the border. That applies to the Eastern States. Also they ship them as far as they can on the Canadian roads.

Senator Walsh. Is not the Canadian shingle sold at a higher price in America than the Oregon and Washington shingle is sold for in the East?

Mr. Case. That is true and it is not true. There are some American manufacturers that get as much for shingles as the Canadians, and some Canadians sell shingles as cheaply as the Americans.

Senator Walsh. Is not the Canadian cedar shingle of a higher quality; does it not, therefore, receive a higher price, and does it not actually compete with the Oregon or Washington shingle?

Mr. Case. No, sir.

Senator WALSH. Well, there are some Canadian shingles that sell for a higher price in the eastern market than the Oregon shingles.

Mr. CASE. Possibly a very few.

Senator WALSH. The Canadian shingles do undersell you?

Mr. CASE. In some cases.

Senator WALSH. Why is it that their importation has been so small compared with the total consumption, if they undersell you?

Mr. CASE. Their importation has increased very rapidly; that is, they have built mills up there and increased something like 300 or 400 per cent since the tariff was taken off.

Senator WALSH. What was the total consumption of shingles in America last year?

Mr. CASE. I can not tell you that right offhand. The importation from Canada was about 11,000,000.

Senator WALSH. What was the total production?

Mr. CASE. I can not tell you offhand what the total production was last year.

Senator WALSH. I have been reading the record here of the Fourth Annual Red Cedar Congress. I believe you attended that congress?

Mr. CASE. Yes, sir.

Senator WALSH. What was the date of that congress?

Mr. CASE. December, 1920, or January, 1921, was it not?

Senator WALSH. The date is not given here.

Mr. CASE. I think it was December, 1920.

Senator WALSH. At this convention a resolution was presented in favor of a tariff upon cedar shingles?

Mr. CASE. Yes, sir.

Senator WALSH. And I take it that out of courtesy to some of the Canadian producers who were present the resolution was not pressed?

Mr. CASE. No, sir.

Senator WALSH. But I notice in the minutes before that when the matter was under discussion Mr. Sanders, who evidently is a Canadian manufacturer, made these assertions, which I do not find answered: "The only thing I ought to consider well before you pass that resolution is whether you have a ghost of a show of accomplishing anything by passing such a resolution through this congress. You have to prove, of course, to make it possible for you to get protection, that the thing that you want that protection against is underselling you or else you have no sympathy at all. If you could get this through I would not blame you at all for going after it, but if you can not get it through in your own minds or you think there is a possibility you can not get it, would it not be better for harmony and dealing together to kill that resolution, because you would have to have the support of the Canadian manufacturers," etc.

Senator WATSON. What is that from which you are reading?

Senator WALSH. I am reading from the minutes of this convention.

Mr. CASE. Would you like to have me explain that?

Senator WALSH. No. I think that while you expressed yourself in favor of a tariff, you thought under the circumstances it should not be pressed, and the resolution was defeated?

Mr. CASE. I would like to explain that.

Senator WALSH. I want to ask you why this statement made by him was not answered in this discussion, "That thing that you want that protection against is underselling you or else you have no sympa-

thy at all." In other words, I find through an argument here he claims that they are overselling you in America, and not underselling you. Now, is that the fact?

Mr. CASE. As I said before, in some cases they are and in some cases they are not. The reason that that was not answered was this. We have a shingle association, whose minutes you have read, that was formed for the purpose of advertising and increasing the sale of cedar shingles, and for the betterment and inspection, both of shingles in Canada and the United States; and on account of those gentlemen being part of the association, we did not think it was the proper time to discuss these things. Therefore, Mr. Sanders was not answered.

Senator SMOOT. Mr. Case, can you tell me why the increase of importations in shingles for the year ending June 30, 1920, was greater than the importations for the year before or the following year?

Mr. CASE. Last year?

Senator SMOOT. Well, for the year ending June 30, 1919, there were imported into this country shingles to the amount of $5,863,927; but for the year ending June 30, 1920, there were imported into this country shingles to the amount of $12,593,760. For the year ending June 30, 1921, there was $7,444,319. Why were the importations for the year 1920 greater than those for the year preceding or those for the following year?

Mr. CASE. The comparsion that you have mentioned would be for the years 1919, 1920, and 1921.

Senator SMOOT. Yes.

Senator WALSH. I have some figures, Senator Smoot. I wonder if they correspond with yours. I would like to ask the witness.

Senator SMOOT. These are the official figures from the department.

Senator WALSH. Do they show that the number of cedar shingles imported from Canada was $14,000,000 worth?

Senator SMOOT. No.

Senator WALSH. And the number of shingles produced in Oregon and Washington were 700,000,000 and importations only 14,000,000?

Senator MCCUMBER. Seven hundred million what?

Senator WALSH. Shingles.

That is 700,000,000 against 14,000,000 from Canada. Can those figures be explained, Mr. Case?

Mr. CASE. I did not get that. We are getting into pretty big figures.

Senator SMOOT. I stated the prices, Senator Walsh. I imagine you are giving the number of shingles that were manufactured.

Senator WALSH. The question I have here is how many million feet of cedar logs were utilized in 1920 by all Oregon and Washington manufacturers, and the answer is 700,000,000. The next question is how many were imported in 1920 from British Columbia, and the answer is 14,000,000.

Senator MCCUMBER. Those are the logs and not the shingles.

Senator WALSH. Yes; those are the logs. I thought they were shingles. Of course, the same proportion would be true as to shingles.

Mr. CASE. I could not answer that question. I have never seen that statement there.

Senator DILLINGHAM. Can you answer Senator Smoot's question?

Mr. CASE. Yes, sir.

Senator DILLINGHAM. Let us have that answer. I am interested in it.

Mr. CASE. There are two features that go into that. During the time of the war, with which you are all familiar, this country——

Senator SMOOT. This is not during war times.

Mr. CASE. Well, this will lead up to it. On the Pacific coast they got out a great deal of spruce, as you know, and they required us to quit our operations in cedar to put in spruce. To qualify that I will say I am in a little different position from some of the witnesses here, inasmuch as we log our own timber and have our own organization and manufacture it; that is, our cedar entirely and some spruce and fir. The Government asked us to discontinue all of our cedar operations and go into spruce, which we did. That left us, when we came into 1919, with all our operations in spruce and fir and necessitated our cleaning up our fir and spruce camps, principally our spruce camps, before we went into cedar again. There was a scarcity of cedar, therefore, that was produced in the United States.

The same condition prevailed, to a certain extent, in British Columbia. But they have a greater percentage of cedar; that is, their forest has a greater percentage of cedar, as ours is distributed among spruce and fir. That made a scarcity of cedar and our mills did not all run. During the war I had four mills and I operated one of them to take care of a few customers. The rest of the mills were closed down because we did not have timber with which to operate them and the Government would not let us log it. The British Columbia mills were favored more and were able to run more.

In 1920, at the time of which I speak, we were unable to get cars to ship our stuff from the American mills. Unfortunately for me, I carried 33,000,000 shingles through the period from the time they were worth $7 to $8 a thousand down to the time they sold for $2.50 to $4 a thousand.

The Canadians with a treaty agreement that they had with the Great Northern Railroad when they went into Canada were able to secure more cars than the American mills could secure. In fact they hauled empty cars by the American mills and brought them back loaded from Canada at a time when there was a chance to make more money in the shingle business than at any other time in the history of that business.

Senator WALSH. Do you say there is a treaty between the Great Northern Railroad and the Canadian Government?

Mr. CASE. I say there was an understanding that they were to furnish all cars that the Canadians wanted when they built the road in there.

Senator WALSH. On that very point, this memorandum which I have before me states that 9 per cent only of the shingles moved east on the Great Northern Railroad from July, 1919, to December, 1920, came from British Columbia, according to the statistics of the Interstate Commerce Commission.

Mr. CASE. Well, I could not say anything about the percentage. I know that what I say is true, that they hauled empty cars by the American mills that were closed down for lack of cars and loaded them and brought them back from the Canadian mills. I do not know anything about your report, but that much I know is true and will be able to verify it. Those are two reasons why there were greater

importations in the month of June, 1920, than there were in any other previous month or in either one of the other years, 1919 or 1921.

Senator WATSON. The Tariff Commission in speaking of this question says: "Canadian shingles have had a better reputation for quality than the American, which, to reduce freight costs, have been kiln-dried until the life is baked out of them." Is that true?

Mr. CASE. That is true of both. The Canadians are not above reproach, as far as drying shingles is concerned, to get underweight, and there are any amount of mills on the Pacific coast trying to cut their shingles to conform with the price they are getting for them, because they can not get enough to pay the cost of manufacture.

Since you have brought up this subject of drying and quality, I will say that I traveled 10,000 miles this spring and visited yards from Springfield, Mass., to the far West. I found among shingles coming from Canadian mills that were manufactured and branded as "perfects"—that is, supposed to be 16 inches long and 5 to 2 when dried—there was not a 16-inch shingle among them; there was not a shingle over 15½ inches long; there was not a shingle that was 5 to 2 among them.

I am just giving you this statement to show you that there are just as poor shingles made in Canada as there are in the United States. These shingles were shipped here and hundreds of cars of them were refused in this country.

Senator WATSON. In other words, you do not deny that poor shingles are made in the United States, but you say there are just as poor made in Canada?

Mr. CASE. We have put on shingle inspection in an effort to weed out the poor shingle. I am probably the oldest shingle manufacturer on the Pacific coast, and I was the first man that ever made a high-grade shingle on the Pacific coast to ship to the Eastern States. And when I talk to you about high-grade or low-grade shingles I know what I am talking about. I continually fought with the other shingle mills to get them to make better shingles, and we are making them better, although some of them are trying to make shingles to compare with the price.

Senator WATSON. The Tariff Commission states that conditions with respect to quality have been improved through the activities of the shingle branch of the West Coast Lumbermen's Association.

Senator MCCUMBER. Let me see if I understand you. You say that in order to reduce the freight in the drying they are dried to such an extent or so rapidly as to get the water out of them and that that injures the shingles?

Mr. CASE. There are some of them that do that, but not all of them.

Senator MCCUMBER. The kiln-drying, then, is liable to injure the shingle itself?

Mr. CASE. Yes; to a certain extent. We are shipping a great many by water to-day to New York, green.

Senator MCCUMBER. When you made the statement about these Canadian shingles being both narrower and shorter than the standard, you meant to say that that was brought about by the kiln-drying?

Mr. CASE. No, sir. It did not take as much timber to make them, or they did not weigh as much. You take an inch off a 16-inch

shingle and you know what you have. When you cut off 1 inch you have cut off quite a bit in weight, and some of them are trying to get their cost out by cutting down on the timber and also on the weight. I never saw a shingle coming from the United States that was cut that way. But I have seen a good many cars that came from Canada. Probably there are American manufacturers that went up there that could not make them down here.

Senator WALSH. There is another line of inquiry that I want to take up for the record. Possibly it has been already covered; and if so, I shall not pursue it. To what extent have roofing substitutes affected the roofing business?

Mr. CASE. I could not tell you just exactly, but it has been to quite an extent.

Senator WALSH. The only fact I noticed that impressed me more than anything else in a recent visit to my home was the extent to which people were using substitutes for shingles. I do not know of anything that impressed me so much in the several houses that I saw under construction. It has affected the business pretty generally throughout the country, has it not?

Mr. CASE. It has to a certain extent, although the demand for shingles has continued good. There has been a great increase in building since the shingle industry started on the coast.

Senator WALSH. The extent to which they are using these substitutes must affect the business.

Mr. CASE. It undoubtedly does affect the business.

Senator WATSON. The Tariff Commission reports that substitutes have affected the consumption of lumber 20 per cent.

Senator McCUMBER. Let me ask you one or two questions directly in point, Mr. Case. Are you operating your mills now?

Mr. CASE. At half time.

Senator McCUMBER. And at a loss?

Mr. CASE. At a loss; yes, sir.

Senator McCUMBER. Are the Canadian mills operating the same way?

Mr. CASE. The Canadian mills, sir, are operating on full time and some of them double time.

Senator McCUMBER. And they are importing now?

Mr. CASE. They sell 80 per cent of their shingles in the United States.

Senator McCUMBER. Then how is the shingle business generally throughout the State of Oregon; are the mills running at full capacity?

Mr. CASE. At least 50 per cent of the mills in the State of Oregon and Washington are shut down.

Senator McCUMBER. And the other 50 per cent are running at capacity?

Mr. CASE. The other 50 per cent are running anywhere from half to full capacity.

Senator McCUMBER. That is evident, in the general aspect, that the Canadians are able to compete now and run their mills at full capacity as against running ours at about half capacity and half of the others running 20 to 50 per cent?

Mr. CASE. Yes, sir.

Senator SMOOT. If you were running full time and producing shingles as cheaply as it is possible to produce them, could you not drive out the Canadian importations?

Mr. CASE. No; we would not drive them out at 50 cents duty.

Senator SMOOT. Then you are not satisfied with 50 per cent?

Mr. CASE. I think that the committee that asked for a duty of 60 cents was very moderate in their request. You take a Royal shingle to-day, the rate of exchange into the United States is $1 a thousand; on a Perfection, the rate of exchange into the United States is 41 cents; on a Perfect the rate of exchange that they save over our money here is 30 cents a thousand. I think they are mighty liberal when they suggest 60 cents. I will give you a little information—that is, I have never seen it: The cost of timber in this country and the carrying charges, part of which is necessitated by our high taxation that we are going to have here and which it is necessary for us to have for a good many years—in Pacific and Grays Harbor counties that I operate in, stumpage is worth from $3 to $4 a thousand. Some of this has been held by the men who have owned it for as long as 30 or 40 years at a price of $3 to $4 a thousand, which is not unreasonable for the carrying cost, considering that they have been paying taxes 30 or 40 years. A section of that timber costs us on the average about $100,000; it is a heavy stand of timber; it is an old-growth timber; it is timber that is ripe and that should be cut. You take at a low rate of interest on $100,000 for a section of timber, and it will cost you $6,000. The taxes on that timber runs from $1,000 to $1,200 a section a year, making a carrying cost for a section of timber in our country there of over $7,000 a year.

I will take you over to British Columbia, and show you Crown-grant land, and I am giving you these figures so that you may see the difference in our carrying costs and see that it costs us more in our country. The Crown-grant land costs a little over $147 a year to carry a section of timber in British Columbia. The licensed land is the same: that is, the carrying costs are about the same. The Crown-grant timber can be exported and the licensed land timber can not. So that we have in our country here $7,000 carrying costs, and the actual carrying costs are taxes, fire prevention, interest, etc., amounting to 25 cents a thousand. On the Crown-grant lands in British Columbia you pay about $150 per year per section until you begin cutting, and the Government carries it, and there are not any other taxes on it at all; it costs us 25 cents a thousand. If you carry this timber in the United States two years, we have absorbed the entire cost of the British Columbia timber to the manufacturers, so far as stumpage is concerned.

The licensed land is not handled as the Crown grant, because on that the price fluctuates according to the price of lumber at the time the timber is cut. To-day it is 85 cents. Consequently, it will take a little over three years carrying costs in the United States on 1,000 feet of timber to cover the entire costs of licensed timber in British Columbia. There is handicap enough.

I say that the committee that came here and asked for 60 cents was mighty moderate, and if they had asked for $1 they would have asked for something reasonable. But we are not going to try to go back and change it. You have 50 cents written in the Fordney bill, and

we are going to try to keep it there. We will file a brief showing these things and giving you in every detail the cost of carrying timber, as that is something I have never seen touched on in this tariff proposition, and that is one thing I wanted particularly to call your attention to.

Another thing I desire to bring before you is the railroad problem. Our railroads in this country are not getting any too much business. As I came across here I found thousands and thousands of cars standing on the siding empty. To-day British Columbia is shipping 80 per cent of all the shingles that they cut, and our mills are standing still, and our railroads are lying still and they need the revenue, and the Government is providing money for the revenue while we are turning this over to the Canadian roads to help take care of them.

Senator WALSH. You brought Mr. Jamison here as a witness?

Mr. CASE. We have a man here who has operated in both places; but along that line——

Senator WALSH. I do not care to bring out anything further. I simply wanted to know if there was a man here who had operated in both places.

Mr. CASE. We have men who own mills in British Columbia and who are operating mills both in British Columbia and Washington—I would say who own mills in British Columbia and Washington, but his Washington mills have not turned a wheel, and he is operating in British Columbia double time. You can draw your own conclusions as to whether it is better to operate in British Columbia or here? We have a man here who is a timber owner in British Columbia but not an operator there.

Senator MCCUMBER. Mr. Johnson, I believe that closes your testimony.

Representative JOHNSON. Mr. McMasters is here with a list of answers to a questionnaire which was sent to all of these shingle manufacturers. From what has appeared you all can see that the opposition seems to come from those who have invested American capital since the passage of the Underwood bill in British Columbia land grants with timber.

Senator MCCUMBER. What do you mean by "questionnaire"?

Representative JOHNSON. The shingle manufacturers sent a questionnaire around to the shingle mills in Oregon and Washington, and the answers show that 90 per cent of all those men favor a tariff on shingles. The exceptions, in most cases, are citizens of the United States with investments over in British Columbia who would have free trade in shingles.

Senator MCCUMBER. Mr. McMasters, you desire simply to file a brief?

STATEMENT OF W. C. McMASTERS, VICE PRESIDENT OF THE McMASTERS SHINGLE CO., KENMORE, WASH.

Mr. MCMASTERS. Our concern personally took this referendum of the Washington and Oregon shingles mills, and I have a sample of a postal card we sent out, with the returns. I have been checking those over and find there are only a very few mills, except those American mills interested both in British Columbia and Washington,

rho have not signed the cards returned saying they are in favor of 0 cents as found in the Fordney bill.

I would just like to answer one question of Senator Walsh: We ersonally have a representative selling shingles in Boston whom he Senator probably knows, and if he is called you will find a comarison of our prices against British Columbia shingles. We have n file many letters from them stating they can not send us business ecause the British Columbia mills undersell us.

REED AND RATTAN.

[Paragraph 411.]

TATEMENT OF CHARLES H. DEMAREST, REPRESENTING RATTAN AND REED IMPORTERS' ASSOCIATION, NEW YORK CITY.

Mr. DEMAREST. I represent the Rattan and Reed Importers' ssociation and also the American Brush Manufacturing Association f Philadelphia and the Importers' Association of New York.

I myself am an importer of reed and rattan. This refers to schedule 11 in the Fordney bill. Rattan is a raw material from which reed s made, and all rattan comes from the Far East, from the Dutch ast Indies and other settlements in the Far East. It is shipped rom there to China, to Germany, and to America, and used for a reat many different purposes in addition to the manufacturing of eeds.

Rattan has always been on the free list for many years past and nder paragraph 648 in the present tariff bill, and reeds unmanufacured have always been on the free list. The manufactured reed we now as a chair reed. Under paragraph 173 in the present tariff bill t now is paying a duty of 10 per cent. Reed manufactured is made n Germany by machines and made in America by machines from this aw rattan, and I might add that recently it has been manufactured n China by American machines which have been sent over there.

Reed unmanufactured is of a different quality entirely, a different rticle you might say. It is a waste material.

The Chinese take this rattan and slice it off by hand with a knife, nd from what is left they pull it through a crude instrument, having flat knife, by hand, and the product is a very cheap, inferior mateial, and this material has always been free, is known as a crude naterial, and has been so decided by the Customs Court of Appeals in pholding the tariff under paragraph 648.

It is used by broom, brush, and basket manufacturers, whom I epresent. This material sells to-day in the market at 9 cents a ound. It cost us landed at New York to-day approximately 7 cents er pound.

In large quantities we sell it at 7½ to 8 cents. The machine-made eed which I have described previously is used in the manufacturing f chairs mainly and sells from 25 to 35 cents and up to 60 cents a ound, and even higher for small sizes. You see, it is made in differnt sizes. This is the size that is used generally for chairs for weaving exhibiting sample to the committee].

Senator WALSH. Do the chair manufacturers manufacture that eed themselves?

Mr. DEMAREST. They do. They make it here of rattan. Then are about 10 manufacturers in this country. These 10 manufac turers make this reed mainly for their own use.

Senator WALSH. The most of them are in my State, are they not

Mr. DEMAREST. The Hayward Bros. & Wakefield Co. are th largest in the manufacture of these for their own use, and all durin these years they had very little to sell to outside small chair or furni ture manufacturers or for any other industry.

I want to describe to you a little difference. In making this ree by hand the Chinese select a better grade than this, more round which is used for chairs as well, which is used for baskets and othe uses, and call it an extra selected or selected reed. That reed sell in the market to-day at from 15 to 25 cents a pound. It is also hand-cut reed, and the Customs Court of Appeals has said that a this is not used for chairs it is free. It is a crude material, use for other purposes than chairs, for baby carriages, and other things But they made a clear distinction, because the tariff says "chai reeds," under paragraph 173.

Senator SIMMONS. It is the same reed?

Mr. DEMAREST. It is the same reed. But it is mainly used fo other purposes than chairs. A small proportion of this is selecte out, that is of a better quality, that we do bring in and sell to a lo of small people who can not afford to pay a price that manufacturer like the Hayward Bros. & Wakefield Co. will not give them. The naturally want to protect their own trade and for their furniture—w do not deny that—that they have never had enough reed for th smaller people, of which there are hundreds and hundreds.

Senator SIMMONS. Is it produced in this country?

Mr. DEMAREST. It is not produced here. There is no hand-cu reed produced here. It is a crude material and employs a grea many Chinese in cutting it by hand.

Senator DILLINGHAM. Are either of these varieties used in th manufacture of brushes?

Mr. DEMAREST. Yes; what we call the cheapest common reed used for brooms and brushes.

Senator SMOOT. In the wording of the bill under consideratio what is the distinction you speak of?

Mr. DEMAREST. The present bill—the Fordney bill—does make distinction. It says in the Fordney bill—you will notice a ver peculiar paragraph——

Senator SMOOT. In the Underwood bill, also in the Payne-Aldric bill, there was a distinction you speak of, but I do not see that the is any in the Fordney bill.

Mr. DEMAREST. Yes, Senator; there is a distinction, and that just what I am here for to protest against mainly for the broom an brush manufacturers. That distinction is this: They say in their bil for the purpose of assessing duties, hand-made reed or cane shall b held to be comparable in value to machine-cut reed or cane of corr sponding sizes. That is dangerous; that is a bad clause.

Senator SMOOT. I think that clause was put in there from th wording here that you complain of in two other bills.

Mr. DEMAREST. It does not get away from what we object to. It a restricted tariff on the broom manufacturers. Here is reed as low 7½ to 8 cents a pound—say, 7 cents it cost us. Twenty per cent base

on the value of machine-cut reed of comparable size which the broom manufacturers use would make the duty 12 cents a pound on 7-cent reed, and therefore restrict the broom manufacturers from using it. In other words, there would be 150 per cent duty according to that clause assessed on reed, hand made.

Senator WATSON. You do not understand that this puts any duty on the raw reed or rattan manufactured?

Mr. DEMAREST. I understand it puts a duty on this unmanufactured reed. There is no other clause providing for it. They have taken it out entirely from the free list, where it has always been.

Senator SMOOT. What you want is a lower rate, if any rate at all, on that used in brushes and brooms. This, however, places, as you say, a duty upon all of them, and does away with the discrimination which is provided in the Underwood and Payne-Aldrich bills. What you complain of is this cheap reed; you think it ought to be on the free list?

Mr. DEMAREST. I certainly do; the same as rattan.

Senator SMOOT. Then there would have to be——

Mr. DEMAREST (interposing). That clause should be stricken out and it should be put in the free list with rattan and split bamboo.

Senator WALSH. How do you make the distinction?

Mr. DEMAREST. The hand-cut reed is imported as hand-cut reed of either three qualities. During this year there has been very little imported of the best grades of these reeds. It is used mainly now for brooms.

Senator WALSH. I suppose the hand-cut is of different qualities, leading up to almost as good reed as the manufactured.

Mr. DEMAREST. No; not as good quality. The manufacturers used it during the war. It was the salvation of the American factories and the industry of chair making and basket making grew enormously. There were small firms all over the country. We have a large list of customers who depended absolutely on this hand-cut reed during the war, and they could not get it from Germany. American manufacturers were selfish enough to use it for themselves, naturally. Why should they not? It was perfectly proper, but we came and imported quite a quantity of this China reed and distributed it around the country and kept that industry working.

Senator SMOOT. You are complaining, then, of the 20 per cent ad valorem on the reed bought and manufactured?

Mr. DEMAREST. We think that under the American valuation that rate is too high.

Senator SMOOT. What are you selling the best grade of hand-cut reed for?

Mr. DEMAREST. From 15 to 25 cents a pound for the best grade of the hand-cut reed.

Senator LA FOLLETTE. What would the rate be under the American valuation?

Mr. DEMAREST. The American reeds are selling anywhere from 60 to 70 cents a pound, and if they are valued at that the rate would be 12 cents a pound duty on an inferior reed.

Senator SMOOT. State just what you want. You want a specific duty?

Mr. DEMAREST. We want a specific duty on the better qualities.

Senator SMOOT. And less than 20 per cent on the cost value?

Mr. DEMAREST. And less than 20 per cent on the cost value.

Senator SMOOT. If you put a specific duty on, then will come directly to the other dilemma of imposing a specific duty on the low-priced reed in comparison with the higher priced.

Mr. DEMAREST. But you can specify on the two better grades.

Senator SMOOT. I am saying if you take out the cheaper reed and put it on the free list, then what percentage do you want here ad valorem—because that is the proper way to have it.

Mr. DEMAREST. Ten per cent, the same as it was before.

Senator CURTIS. There was very little imported dutiable came in?

Mr. DEMAREST. $170,000. It has been cut down since the war.

Senator CURTIS. Then it was a matter of revenue.

Mr. DEMAREST. It looks to me as if it was for revenue, but there must be another reason there.

Senator CURTIS. When it was free, rattan went up to $3,000,000.

Mr. DEMAREST. Rattan is a very large article, if they wanted revenue; why not put a specific duty on rattan? As you say, a 2-cent specific duty on rattan would bring the revenue. I am not advocating that, however.

Senator SMOOT. Take it from the free list and put it where you have it, where you have asked.

Mr. DEMAREST. Reeds unmanufactured ought to stay there on the free list, and split bamboo is there, which is another article for brooms, an article which costs 3 cents, and they put on it 2 cents a pound duty, in the Fordney bill, and it has always been free. It is a broom-maker's material.

You gentlemen were speaking about watches while I have been here. A wrist watch and a 17-jeweled watch. It is just as wrong to put value on a wrist watch as a 17-jewel watch, and place a duty on that as it is on this raw material calling it something else, calling it a machine reed for dutiable purposes.

Senator DILLINGHAM. While we are speaking about that, what class of brushes are manufactured from reeds?

Mr. DEMAREST. We make these push brooms and street brooms, and they fill the corn broom with these, in the center. I might cite an instance why the American manufacturers do not need protection on this material. Here is a card from Hayward Brothers & Wakefield Co., received recently, offering the waste material from the rattans that they cut at 5 cents a pound for broom purposes, so that if the broom manufacturers wanted to use this they could do it. They do not need the protection. Our material sells to-day under the most reduced price at 7 cents per pound. It was selling up as high as 20 to 25 cents for the cheapest material. So that the manufacturer does not need protection on any material he makes into brooms. It is waste.

Senator SMOOT. Supposing we imposed a duty of 2 cents a pound on rattan for revenue purposes, what effect would that have upon the manufactured and wrought rattans?

Mr. DEMAREST. I think there will be other people here who will speak on the question. I am not interested as a manufacturer of rattan.

Senator SMOOT. That is what I wanted to find out.

BRIEF OF CHARLES H. DEMAREST, REPRESENTING THE RATTAN AND REED IMPORTERS' ASSOCIATION, NEW YORK CITY.

This brief refers to Fordney tariff, Schedule 4, paragraph 411, and free list, Schedule 15, paragraph 1683. Unmanufactured hand-cut reeds have always been classed "free of duty."

This is a raw material imported from China, mainly for use in brooms and baskets, and the better selections for cheap chairs, furniture, and baby carriages, and wicker goods of all kinds.

This article is not made here by hand and is not grown here, therefore, I submit, should be free of duty, as it does not interfere in any way with the sale of domestic reed.

Paragraph 411 would assess duty on this low grade of reed on the same value as other reed made here by machinery, by a few very large manufacturers, causing the duty to run (instead of 20 per cent as intended) not less than 150 per cent; as American-made reed in small sizes would be worth 60 cents per pound, against a value on broom or basket reed of 7 cents per pound, making the duty 12 cents per pound on a 7-cent article.

There are other grades of hand-cut reed which are known as selected and extra selected. The same inconsistency in a lesser degree would apply to the levying of duty on the same basis of value on these other grades.

We respectfully submit that this is a raw material, the same as rattan, and should be inserted in paragraph 1683, as it is used mainly in the manufacture of brooms, baskets, furniture, baby carriages, etc., as is rattan, which is used for the same and other purposes, and that a duty which would certainly exclude importation should not be placed on this article.

We submit in paragraph 411 that the words "For the purpose of assessing duties hand-made reed, or cane, shall be held to be comparable in value to machine-cut reed, or cane, of corresponding sizes," be omitted, as it is a most aggravating clause.

Also, "split bamboo, 2 cents per pound," be omitted, and that in paragraph 1683 be inserted "Split bamboo, and hand-cut reed, unmanufactured, for brooms, brushes, baskets, etc., free," as it is free under paragraph 648, act of 1913.

There is another article known as machine-cut reed, imported from Germany and China, which compares in value with machine-cut reed made in America by a few American manufacturers only, mainly for their own use.

Most manufacturers depend on imported reed for their supply, as enough reed has never been produced in this country to supply the very large demand for the various purposes, therefore, recommend that a competitive duty be assessed, not over 10 per cent ad valorem on all machine-made reed, same as present tariff schedule D, paragraph 173. If the Government needs revenue, a 10 per cent duty ad valorem, or a specific duty of 2 cents per pound, be placed on rattan, which is also a raw material, and is on the free list under the present and previous tariffs.

STATEMENT OF WILLIAM S. FERRIS, REPRESENTING THE SIDWAY MERCANTILE CO., ELKHART, IND.

Senator SMOOT. You want to speak on paragraph 411?

Mr. FERRIS. Yes; paragraph 411.

I represent the Sidway Mercantile Co., of Elkhart, Ind., manufacturers of baby carriages and reed furniture. With your permission, I will speak for manufacturers who were here on last Friday and Saturday but who were not able to remain over.

Senator SMOOT. Do you also speak for William A. Ryan?

Mr. FERRIS. No, sir. I speak for Mr. Bloch and for other manufacturers whose names are appended to the brief which I will hand to you in a moment.

We believe, in the first place, in the principle of a protective tariff, and we believe in establishing a rate of duty on reed which will represent the difference between the labor cost of production in China and in the United States.

The present duty on reed under the Payne-Aldrich bill is 10 per cent. The measure under consideration proposes to impose a rate of duty of 20 per cent.

Senator SMOOT. You want 10 per cent?

Mr. FERRIS. We want 10 per cent. You have been advised by witnesses who preceded me that reed is cut from rattan and that no rattan is grown in the United States.

Senator SMOOT. Would you have any objection if we put rattan on the dutiable list?

Mr. FERRIS. Not at all, if you want rattan on the dutiable list, but we would suggest that the rate on rattan be 10 per cent if 20 per is imposed on reed——

Senator SMOOT (interposing). Do you want a proviso here saying that for the purpose of assessing duties, hand-made reed or cane shall be held to be comparable in value to machine-cut reeds or cane of corresponding size?

Mr. FERRIS. We think that is unfair, because hand-made reeds are of much less value than machine-cut reeds.

Senator SMOOT. In other words, you would prefer to agree to a 2-cent rate, or whatever rate it is desired to put upon rattan?

Mr. FERRIS. We are perfectly willing to pay an ad valorem rate on hand-cut reed.

Reed is an absolutely essential material for the manufacture of baby carriages and reed furniture. No substitute material of equal value can be found.

No other single item of material entering into the cost of baby carriages and reed furniture that equals in value the reed used.

The baby-carriage manufacturers in the United States have a capital investment of approximately $15,000,000.

They employ, under normal conditions, about 8,000 operatives.

There are upward of 100 manufacturers of furniture, by whom reed and winding cane are used. These manufacturers have an investment of about $40,000,000 and employ normally 27,000 operatives.

Senator SMOOT. What is the China hand-cut reed worth per pound to-day?

Mr. FERRIS. From 15 to 25 cents per pound.

There are about 10 American cutters of reed, only four of whom, I understand, cut reed in any large quantities. I am advised by what seems to be dependable authority, that they have invested in that industry approximately $3,000,000 and employ not over 600 operatives.

Reed is, as I think I have said, an absolutely essential material in the manufacture of baby carriages. There is no single item of material entering into the manufacture of baby carriages and reed furniture that can be used as a substitute.

Senator SMOOT. What is the percentage of labor cost?

Mr. FERRIS. As compared with the material cost?

Senator SMOOT. What percentage of the total cost of the baby carriage is labor cost?

Mr. FERRIS. About 35 per cent, I think. I think that would cover it.

You understand, of course, that there is no hand-cut reed made in the United States. The machines used for the purpose of cutting it are largely manufactured by one single manufacturer, and he, I am advised, has supplied a large proportion of the machines used in China as well.

That manufacturer tells me that one machine will produce in nine hours 334 pounds of reed, in sizes from 4 to 6 millimeters. Granting that the operator receives 50 cents an hour, which is high, the labor cost is less than 1.5 cents per pound.

Senator SMOOT. That is cutting alone.

Mr. FERRIS. Then there is the handling charge of perhaps half a cent a pound. Mr. Demarest said to you that the cost of Chinese reed varies from 15 to 25 cents per pound. A 10 per cent ad valorem rate—the rate under the Payne-Aldrich bill—applied to that amounts to as much as or more than the entire labor cost of producing the reed in the United States.

As I said to you a moment ago, we appeal to you most earnestly to keep the rate at 10 per cent, or, as it now appears in the Payne-Aldrich bill, and not to raise the rate to 20 per cent.

Of these 10 American manufacturers to whom I referred a moment ago, 4 of them are American manufacturers of reed furniture, that is to say, they are producing furniture and baby carriages, and 2 of them are large operators. If this rate is increased to 20 per cent, it will give them a distinct advantage in the cost of the largest item of material over our manufacturers who are buying the imported reed. There are 4 of them; there are 130 of us. This increase would give them a distinct advantage over us. It would give them an advantage which it will be very hard for us to overcome. It means that this amount will have to be taken out of the present profits of the manufacturers, or passed on to the consumer, and when the overhead is added, it is quite a burden by the time the article reaches the consumer.

Senator LA FOLLETTE. About what per cent does the burden, or the overhead, bear to the entire cost?

Mr. FERRIS. On the material or reed?

Senator LA FOLLETTE. I mean the reed.

Mr. FERRIS. Between 45 and 50 per cent. In other words, you are trying to arrive at what is profit?

Senator LA FOLLETTE. No, not yet; I was trying to find out just how badly you would be affected by those two or three factories having this advantage on the materials. Now, what percentage of the cost of the baby carriage is the reed?

Mr. FERRIS. May I answer that in a different way? If we take the Chinese reed at 20 cents a pound to-day and apply the 10 per cent ad valorem, the duty would be 2 cents a pound. If you apply the American valuation and the proposed 20 per cent rate of duty to that same quality of reed, which would sell in this country at 40 cents, the duty would be 8 cents, or an increase of 6 cents. It takes about 7.5 pounds to make a baby carriage that will sell around $18.

Senator SMOOT. Do they charge 100 per cent more when they sell reed in this country than if it is the Chinese reed?

Mr. FERRIS. The American price is very much higher than the Chinese price.

Senator SMOOT. You said 100 per cent.

Mr. FERRIS. Pardon me. I do not follow your question.

Senator SMOOT. Your illustration was 20 cents for Chinese reed and 40 cents for American. That is 100 per cent. Is there that difference?

Mr. FERRIS. There is that difference. The increase in the cost of this item of raw material would be 45 cents for this baby carriage. It sells for $18. What we are asking for is that the rate be continued at 10 per cent.

Senator LA FOLLETTE. You stated at the outset that you thought the duty should be based upon the difference between the cost of production——

Mr. FERRIS (interposing). The labor cost.

Senator LA FOLLETTE. Yes; the difference in the labor costs.

Mr. FERRIS. Yes; to protect the American workman.

Senator LA FOLLETTE. Now, in order that we may get at the difference in the cost of labor in the manufacture of baby carriages, will you file a statement of just what proportion of the total cost is direct labor? You would not claim it is as high as 45 per cent. of course, or anything like it, because a large part of the work of getting out baby carriages is accomplished by machinery. Isn't that true?

Mr. FERRIS. This reed is all woven by hand, Senator La Follette.

Senator LA FOLLETTE. I understand 7.5 pounds of reed is woven by hand.

Mr. FERRIS. Yes.

Senator LA FOLLETTE. How long does that operation take?

Mr. FERRIS. That is according to the design and the pattern.

Senator LA FOLLETTE. Of course that would be true, but I am asking for the average time.

Mr. FERRIS. From two to eight hours.

Senator LA FOLLETTE. What are you paying your common labor? You employ some common labor, do you not?

Mr. FERRIS. Yes. We pay 30 cents an hour—25 or 30 cents an hour.

Senator LA FOLLETTE. Well, which is it?

Mr. FERRIS. It varies according to the class of work. The average would be 30 cents.

Senator LA FOLLETTE. That is the average of all the labor?

Mr. FERRIS. The average for common labor.

Senator LA FOLLETTE. What proportion of your pay roll is common labor?

Mr. FERRIS. Thirty per cent.

Senator LA FOLLETTE. About 30 per cent?

Mr. FERRIS. About 30 per cent; yes, sir.

Senator LA FOLLETTE. You are speaking now in numbers or costs?

Mr. FERRIS. In numbers.

Senator LA FOLLETTE. What percentage of your total labor cost is common labor?

Mr. FERRIS. Twenty per cent of the total labor cost.

Senator LA FOLLETTE. Do you call weaving common labor?

Mr. FERRIS. We do not.

Senator LA FOLLETTE. What part of the labor that enters into the making of baby carriages is common labor? What do they do?

Mr. FERRIS. The handling of the material.

Senator LA FOLLETTE. The sorting, you mean?

Mr. FERRIS. Sorting, handling, trucking, and items of that kind.

Senator LA FOLLETTE. I think I have your address, have I not?

Mr. FERRIS. Elkhart, Ind., is my address. Are there any other questions?

Senator SMOOT. No; thank you.

BRIEF OF WILLIAM S. FERRIS, REPRESENTING THE SIDWAY MERCANTILE CO., ELKHART, IND.

This brief, subscribed to by the manufacturers of baby carriages and furniture in which reed and winding cane is used—whose names are appended hereto—relates to paragraph 411 of bill H. R. 7456, which places an ad valorem duty of 20 per cent on "reed wrought or manufactured from rattans or reeds."

We believe firmly in the principle of a protective tariff and in the protection of American workmen. We have no complaint to make against a proposal to establish a rate of duty on reed which will equal the difference between the labor cost of production in China and the United States.

The rate appearing in the Fordney bill grants a very much larger measure of protection than is needed for that purpose.

All reed manufactured in the United States is machine cut. None is cut here by hand. One machine carefully operated will produce an average of 334 pounds of reed measuring 4 to 6 millimeters in nine hours. Granting that the operator receives 50 cents an hour, which is high, the labor cost is less than 1½ cents per pound.

The duty under the Payne-Aldrich measure—that is, 10 per cent ad valorem on imported reeds 4 to 6 millimeters in size—ranges from 1¾ to 3 cents per pound, or more than the entire labor cost of production in the United States.

Reed is cut from rattan grown in the Far East. No rattan is grown in the United States.

Winding cane is a product of rattan and carries the same rate of duty as reed.

Reed is an absolutely essential material for the manufacture of baby carriages and reed furniture. No substitute material of equal value has been found.

No other single item of material entering into the cost of baby carriages and reed furniture equals the value of the reed used.

The baby carriage manufacturers who subscribe to this brief have a capital investment of approximately $15,000,000 and employ normally 8,000 operatives. The furniture manufacturers, 100, or more in number, who use reed and winding cane have a capital investment of approximately $40,000,000 and employ normally 27,000 operatives.

We are advised on good authority that the American cutters of reed, 10 in number, have invested in that industry not to exceed $3,000,000 and employ in the cutting and handling of reed not in excess of 600 operatives.

At least four of the American cutters of reed manufacture baby carriages and furniture in which reed and winding cane is used.

We, the undersigned manufacturers protest most earnestly against the proposed increase in the rate of duty on reed, because it gives these four manufacturers an unwarranted advantage over their competitors who do not cut their own reed, an advantage to which they are not entitled.

It may be suggested that this advantage can be overcome by cutting our own reed. The answer is that it is impracticable for a large number of concerns to cut reed in the United States, because there is only a limited market for the by-products, which represent at least 25 per cent of the raw rattan.

These by-products are used in China in the place of heavy wrapping twine and are woven into matting which is used in place of heavy wrapping paper and burlap.

Some conception of the profit made can be obtained from the following figures, quotations made in April, 1921:

	Overseas Rattan & Cane Manufacturing Co., Ionia, Mich.	J. A. Dunn Co., Gardner, Mass.	Heywood-Wakefield Co., Baltimore, Md.	American Rattan & Reed Manufacturing Co., Brooklyn, N. Y.
Reed webbing per square foot	18 cents less 10	18 cents less 10	18 cents less 10	18 cents less 10.
Close cane webbing in the various grades as per printed price list.	35 cents less 10	35 cents less 10	35 cents less 10	35 cents less 10.
Common No. 2 cane	31¼ cents less 10	31¼ cents less 10.	31¼ cents less 10.	31¼ cents less 10.
[illegible] flat		40 cents less 10	40 cents less 10	40 cents less 10.
No. 2 reed winding	37.50 cents less 10			37.50 cents less 10.
2-millimeter cut reeds		40 cents less 10	40 cents less 10	40 cents less 10.
[illegible]-millimeter cut reeds		54 cents less 10	54 cents less 10	54 cents less 10.

The following cost figures are taken from the production records of an American manufacturer:

Loontie rattan cost in April, 1921, at Singapore:	Per pound.
$12 per picul, or	$0.09
Ocean and overland freight	.03
Waste in cutting, 25 per cent of original cost plus freight	.03
Cost of labor for cutting	.015
Total	.165
Overhead charges, 50 per cent	.0825
Total	.2475

To this cost of $0.24¾ per pound must be added a profit—assuming a profit of 25 per cent, which is a vastly larger profit than any baby carriage or chair manufacturer can show—the finished product could be sold at a price of 32 cents per pound, with a 25 per cent profit. From the quotation listed above, it will be seen that American manufacturers were asking $0.40 a pound for 4-millimeter reed.

In April, 1921, the best grade of machine-cut Chinese reed, 4 millimeters in size, was offered for sale in the United States at 31 to 34 cents per pound, carrying charges to port of entry and duty paid.

We protest against a 100 per cent duty increase and ask that the duty on reed and winding cane be no higher than that imposed under the Payne-Aldrich bill, which is 10 per cent ad valorem.

If the Government feels that its financial needs require that the baby-carriage and reed-furniture industry contribute this increase in revenue, then we most respectfully urge that a 10 per cent ad valorem duty be placed upon rattan.

Supplemental Brief.

Our original brief contains the statement "that no material of equal value has ever been found as a substitute for reed."

A witness testified before you on August 29 that a substitute exists for reed which is of equal value and can not be distinguished from reed, that a large number of manufacturers are now using this substitute, and that a large proportion of the baby carriages now being manufactured are made of the substitute. The substitute referred to is twisted paper, or "fiber," as it is commercially known.

In order to prevent fiber from absorbing moisture its pores must be completely filled with a casein solution, and when so treated the surface is smooth and will not hold a finish. If treated so that the finish will adhere to the surface, the fiber when brought in contact with moisture will absorb enough moisture so that it swells and the finish drops off.

Reed does not have to be so treated, and because of its porous nature retains a finish indefinitely.

Fiber is very much heavier in weight than reed and produces a much heavier baby carriage. The weight of her carriage is of vital importance to a mother in the weakened condition in which she is left following childbirth.

It must be obvious, therefore, that the substitute falls far short of being equal to reed.

During the war, when importations of reed and rattan were limited or cut off entirely baby carriage manufacturers used the substitute, which is woven into sheets by machinery, and skilled labor is not required in applying it to baby carriage and furniture frames.

Some baby carriages are still being made of this substitute material, but by far the greater number are made of genuine reed.

The statement was also made by the witness referred to that the labor costs of producing a pound of reed which appear in the original brief filed by us are incorrect. These figures have been subsequently checked and found to be correct.

STATEMENT OF CARL GERDAU, REPRESENTING THE OTTO GERDAU CO.

Mr. GERDAU. We believe that the present duty of 10 per cent on reeds and cane and the duty of 20 per cent on them proposed by the House of Representatives are both too high. We believe that reeds and cane should be on the free list, because they are used only as raw materials. They are the raw materials of the wicker furniture, baby-carriage, toy, and whip manufacturers.

The following are the largest reed and cane producing concerns in the United States: American Reed & Rattan Co., The Heywood Bros. & Wakefield Co., John A. Dunn & Co., and Ypsilanti Reed Furniture Co.

Of these the American Reed & Rattan Co. is the only one which limits itself to cutting and placing the reed and cane on the market. All the other firms which I have mentioned, after cutting their reeds from the rattan, use same for their own furniture and baby-carriage factories, though they also sell their reeds to the thousands of smaller furniture factories which do not cut their own.

We believe that the only reason why these few large furniture concerns which I have just mentioned desire a tariff on reeds is because a tariff will aid their furniture business. They have the natural, though selfish, desire either to keep their thousands of smaller competitors without reeds and cane entirely or to sell to them at prices sufficiently high to make their serious competition in furniture impossible. A duty on reeds makes it possible for the few large furniture companies to do this.

Any duty on reeds, therefore, gives the few large furniture companies who cut their own reeds an immense advantage over the thousands of smaller furniture factories who do not cut their own reeds. We believe that this is the only reason why the former have asked for a tariff on reeds.

In this connection it is significant to note that the American Reed & Rattan Manufacturing Co. produces reeds and cane, but does not manufacture furniture, and did not submit a brief or appear before the Ways and Means Committee.

With the exception of the Ypsilanti Reed & Furniture Co., in whose behalf Mr. Green spoke this morning, all the reed-producing firms I mentioned before have been in business for many years prior to the war, some of them from 30 to 40 years. It can therefore hardly be argued that the reed industry needs protection because it is a new one; nor was there really any reason why they should do so, because there has never been a time when so little reed and cane have been imported as at present. Before the war about $1,500,000 worth of reeds and cane were imported annually. The total imports at all ports, according to customhouse figures, were: May, $35,119; June, $36,137; July, $34,532. In comparing these imports with the prewar average one must bear in mind that the present prices are still 50 per cent above the prewar average.

When the few large furniture manufacturers who make their own reeds and cane appeared before the Ways and Means Committee, they appeared very much worried over competition from Chinese machine-cut reeds. The figures which I have just given certainly do not justify any fear on account of Chinese machine-made reeds, because fully half of the imports during this three-month period were from Germany, and the bulk of the remainder, if not all of it, was Chinese hand made and not machine made. The Chinese hand-made reed is so inferior that it does not compete against American reed.

As a matter of fact, the attempt to teach the Chinese to use machinery has been made over and over again, and always resulted in failure. The German manufacturer from whom we are getting our reeds opened a reed factory in the East several years before the war. For a short time things went fairly well, but before long inefficient oriental labor had ruined the machinery and the plant was closed down. It would not pay to use skilled white labor, because such laborers would ask much higher wages than they get here in order to induce them to live in the Orient. Since then Heywood Bros. & Wakefield have opened a plant in Singapore, but this also has not been a success. The last to try the experiment were the Ypsilanti people, who have lately sent reed machinery to Singapore.

So that the committee may realize how absolutely imaginary is the fear of Chinese machine-made reeds and judge for themselves that this argument is only brought up with the purpose of obtaining a monopoly of the reed-furniture industry through a tariff on reeds. We should be very glad indeed if you would cable the American consul in Singapore, asking him to submit the value of all machine-cut reeds exported to the United States, say, during the last six months.

Furthermore, the reed and cane cutting industry is not an important one as far as the number of laborers employed by it is concerned. There are not more than 500 men employed in the United States for the actual cutting of rattan into reed and cane.

A duty on reeds, therefore, can only benefit a small number of people, while it harms all the thousands of small furniture, baby carriage, and toy manufacturers, who employ between 100,000 and 200,000 men.

We therefore ask that the duty on reeds be repealed. This will place all the small wicker-ware manufacturers who do not cut their own reeds on a fair and equal basis with the few large manufacturers who do cut their own reeds and cane.

SPLIT BAMBOO.

[Paragraph 411.]

STATEMENT OF F. A. STEIERT, REPRESENTING A. STEIERT & SONS.

Senator SMOOT. Have you tried to agree on some one to speak on paragraph 411?

Mr. STEIERT. No, sir. I have one of the simplest problems you have had to tackle. The product or article in which I am interested is different from any of the articles these gentlemen have spoken about. It is a very simple proposition, and I shall not take more than three or four minutes to explain it. I represent the firm of A. Steiert & Sons.

We are manufacturers of municipal brooms for street-cleaning purposes. We supply 149 cities. We are relying entirely on this raw material to make our brooms from. There is a proposed tariff duty of 2 cents a pound on it, or 66⅔ per cent. There are but two vital points to be dwelt upon, and I shall not take more than three or four minutes to present them to you.

Senator SMOOT. There is not a 2-cent rate in the bill.

Mr. STEIERT. In paragraph 411.

Senator SMOOT. You are speaking now of what?

Mr. STEIERT. Of split bamboo. It is in there in six little words. It is in so small a space that it might easily escape your notice.

Senator SIMMONS. Did I understand you to say that there is a duty of 66⅔ per cent?

Mr. STEIERT. Two cents a pound is. The first point that I wish to emphasize here is——

Senator SIMMONS. Is there any produced in this country?

Mr. STEIERT. That is the point. The first point is that this fiber is of a vegetable nature. It grows in the Orient; it can not grow here. It does not interfere or compete with anything. It does not require a protective tariff, because there is nothing here to protect. That is the first point.

Senator SIMMONS. What other things is it used for?

Mr. STEIERT. For brooms. That is the only use that I know of.

Senator LA FOLLETTE. What percentage of your total output goes to the municipalities?

Mr. STEIERT. Practically all of it. The second vital point is that our industry has the great flushing machines to compete with, the machines that wash the street. Their raw material is water, which costs them nothing. Our raw material costs us something. If this duty is placed upon our raw material, it will be impossible for us to compete.

There is one phase of this situation that is absolutely necessary for you to know in order that you may arrive at a just conclusion. You must know why the reed manufacturers have asked for this duty. Reed is a distinct and separate article from this. When they bring in the reed, from its natural state, the reed grows with bark around it, or a shell. When the shell is removed, so as to get at the reed, this shell or this bark is left. Like the shell of a lima bean, it is absolutely worthless. It is a sort of sleeping, brittle affair, having no sparkle or life to it. We could not use it if they paid us to take it. There is no comparison between it and this good-natured, snappy fiber that I have here [indicating].

Senator LA FOLLETTE. Is it expected to convert that into material for brooms?

Mr. STEIERT. Their plan is that if they can get a duty on this [indicating], they can force us to use it. I hardly think it is necessary to prove that the motive is a selfish one; it is absolutely raw.

Senator LA FOLLETTE. Did I get your address?

Mr. STEIERT. Front and Reed Streets, Philadelphia. I will, if I may, file a brief in which I will prove that our industry at the present time is so badly demoralized that there are not enough brooms consumed in the United States to keep one good-sized plant running. I will prove also that if you put this prohibitive duty on us you will

eliminate us altogether. You will also eliminate about 50 per cent of the broom pushers in the various cities.

Senator SIMMONS. In other words, the manufacturers who actually use this first material—what do you call it?

Mr. STEIERT. Split bamboo.

Senator SIMMONS (continuing). You do not come here and ask for this 66⅔ per cent, but somebody that wants to force its use upon you has asked for a duty upon that article?

Mr. STEIERT. I did not quite get the drift of that question. I know that the reed manufacturers have asked for a prohibitive duty on this. They put it in six little words.

Senator SIMMONS. Somebody that does not use that at all has tried to get a duty on it, while you, who do use it, do not want the duty?

Mr. STEIERT. No one really wants it. They have this material on their hands and do not know what to do with it.

Senator LA FOLLETTE. It is a duty imposed for revenue purposes, I suppose.

Mr. STEIERT. There is one more thing that I would like to impress upon you, gentlemen, and that is that we have not as large sums invested as have the oil companies and the steel corporations, but nevertheless this means our bread and butter to us, and we beg you not to take it away from us.

REED AND FIBER FURNITURE.

[Paragraph 411.]

STATEMENT OF E. F. GANAHL, REPRESENTING O'CONNOR-HARRISON CO., SAN FRANCISCO, CALIF., IMPORTERS AND EXPORTERS.

Senator SMOOT. Mr. Ganahl, have you agreed to speak for these other gentlemen interested in the same subject?

Mr. GANAHL. No, Senator Smoot; I am here on another subject. I have here a brief that contains our argument. If I may file this brief, I will give way to others who wish to appear.

Senator SMOOT. File it, please. Those are the briefs that we are going to examine.

Mr. GANAHL. This covers the subject. I want to ask this committee that when you consider this subject——

Senator LA FOLLETTE. What paragraph?

Mr. GANAHL. Paragraph 411. I ask you that you remember that it is probably the only commodity of its kind in which the ocean freight charge from the Orient to the Pacific coast ports amounts to more than the original cost of the product. Therefore, this product is already protected to an extent of 100 per cent, besides the protection that you will give it under a protective tariff.

Senator SIMMONS. Who is asking for this protection?

Mr. GANAHL. Only one reed-furniture manufacturer.

Senator SMOOT. You may file your brief.

BRIEF OF E. F. GANAHL, REPRESENTING O'CONNOR-HARRISON CO., IMPORTERS AND EXPORTERS.

We are opposed to that part of paragraph 411 of the proposed tariff as passed by the House which has reference to rattan, reed, and grass furniture We are not protesting against an increase in the present rate on these commodities. We only wish to call to your attention the excessive rate as proposed by the House and to request

at a lower and suitable rate be substituted therefor. Upon close analysis you will ıd that the proposed rate of 50 per cent ad valorem on American valuation is an crease of about 3,000 per cent over the present duty, and amounts to about five mes the original cost of the furniture.

The proposed duty would entirely stop the importation of all furniture in this ase. This has been proven conclusively by the fact that since the proposed rate as announced buyers will not consider placing orders for the imported furniture. ur 14 salesmen who are now traveling through all parts of this country advise that tis is occasioned by the fact that we will accept orders only on the basis whereby ny changes in the present duties are for the account of the buyer, and the buyers ate that the proposed duty of 50 per cent will make it impossible for them to dispose the furniture at retail.

The American manufacturers have in the past, and are at present, manufacturing ed and fiber furniture. They never have and are not at present manufacturing ass, peel, or rattan furniture to any extent. American-made grass, peel, and rattan rniture is practically unknown. The reason for this we shall set forth later. If e American manufacturer requires additional protection on reed furniture, which e seriously doubt owing to the great difference in quality between the imported nd the domestic reed furniture, he can secure no benefit by having a prohibitive uty levied on grass, peel, and rattan furniture. If, therefore, Congress deems it ecessary to grant better protection to the manufacturer, a higher rate can be levied n reed and fiber furniture, but grass, peel, and rattan furniture should be eliminated nd should take a separate and distinct rate.

The proposed duty will not encourage additional or new industries. Rattan, eel, and grass furniture can not be and never will be manufactured in large quantities in this country so long as reed and fiber furniture is manufactured. An American ade rattan, peel, or grass chair will cost as much to manufacture as will a reed chair. Rattan, peel, and grass furniture, if it cost as much or nearly as much as reed or fiber urniture, will not sell in competition with reed and fiber furniture. The reason for his is that reed and fiber furniture can be painted, stained, dyed, or otherwise finished nto various colors and effects so that it will match with the furnishings in any part f a house. Most domestic reed and fiber furniture is at present finished into different olors and effects at the factories. Rattan, peel, and grass furniture, especially rass, can not be painted, stained, or finished, owing to the fact that no finishing aterial will stick to the surface of grass or rattan. Most rattan, peel, and grass furniture must therefore be sold in the natural state, and for this reason never has and ever will be manufactured domestically in large quantities. It is only for the eason that the imported furniture sells for very much less than does the domestic eed furniture, and is purchased by those persons who can not afford the domestic eed furniture, that any business is done on the imported rattan, peel, and grass urniture.

The manufacturers of this country as a whole are dependent, especially since the ast few years, to a large extent on foreign orders. At present a great many of our argest industries are developed and have expanded to the extent that foreign orders re required. Without foreign orders the size of their plants and organizations must e reduced. In order to continue securing foreign orders for our products, we must ontinue purchasing from our foreign customers. If we prohibit or reduce imports, e will in time reduce or stop our exports accordingly. The Orient has probably the est possibilities for our manufactured products. We, therefore, should continue mporting those oriental products which do not compete or which compete the least ith our manufacturers. Grass, peel, and rattan furniture is one of the best noncompeting commodities we can import from south China.

The imported furniture is of entirely different quality than is the domestic reed or ber furniture. While the imported furniture is serviceable, still the domestic furniture is of better material, more attractive, better built, more comfortable, and in all espects better furniture, and sells at a very much higher price. A domestic reed chair ells at $24 or higher retail on the Pacific coast, while an imported grass chair sells retail at about $12. The proportion all over the country is the same. There are many American families who can not afford the domestic furniture, but who can afford the mported furniture. If the proposed duty goes into effect, it will be impossible for hese people to enjoy this class of furniture.

This furniture is one of those few and peculiar imported commodities upon which he water freight, insurance, and handling amounts to more than the original cost of the urniture in the place of production. Under American valuation, duty will be levied n the average wholesale prices in the principal American markets, which wholesale prices will include duty. Thus, on furniture, the duty will be levied on the original ost of the furniture at place of production, on the water freight, insurance, and hand-

ling, which amounts to more than the original cost of the furniture, on the duty, which also amounts to more than the original cost, as well as on the wholesaler's profits and commissions. Therefore, so far as furniture is concerned, by keeping the present duty of 15 per cent, the amount collected under the American valuation plan would be many hundred per cent higher than at present collected. In order to make ourselves clear, we will show how we arrive at the present wholesale price on an imported grass chair, and to what extent the proposed duty and suggested duties would affect the same price. This calculation is based on the present actual Hongkong cost of a medium-priced chair converted into United States currency at the present rate of exchange, namely, 51½ cents to a Hongkong dollar.

	Present duty.	50 per cent proposed duty.	10 per cent suggested duty, American valuation.	Suggested specific duty.	25 per cent [illegible]
Cost f. o. b. Hongkong	$2.00	$2.00	$2.00	$2.00	[illegible]
Water freight	2.00	2.00	2.00	2.00	[illegible]
Handling and insurance	.12	.12	.12	.12	[illegible]
Duty	.30	8.93	.65	.75	[illegible]
Selling commission 10 per cent on selling price	.60	1.80	.65	.67	[illegible]
Net cost f. o. b. San Francisco	5.02	14.85	5.42	5.54	[illegible]
Gross profit 20 per cent on cost price	1.00	3.00	1.08	1.11	[illegible]
Wholesale selling price	6.02	17.85	6.50	6.65	[illegible]

The 50 per cent proposed duty would therefore result in the following so far as this particular chair is concerned:

1. Increase in duty of $8.63, or 2,980 per cent.
2. Increase in wholesale selling price of $11.83, or 297 per cent.
3. Increase in retail selling price of $23.86, or 297 per cent.

By referring to pages 1200 to 1208, inclusive, of hearings before the Ways and Means Committee in reference to tariff revision you will find that the only information secured or testimony taken in regard to imported furniture of this class was from the Ypsilanti Reed Furniture Co. This company is one of the largest manufacturers of reed and fiber furniture in the United States. There was no testimony or information secured or requested from the dealers in imported grass and rattan furniture. Mr. F. W. Green, the principal stockholder in the Ypsilanti Reed Furniture Co., appeared on behalf of his company, and submitted a brief which appears on page 1206. This brief includes a suggestion as to how a new tariff should be worded. By comparing the part of paragraph 411 relating to furniture as adopted by the House with the brief you will find that the same is taken verbatim from Mr. Green's brief with the exception of the rate applied. Mr. Green submitted no figures as to cost or competition to the committee, neither did he explain the vast difference between reed, grass, and rattan furniture, and the difference in quality between the imported and domestic article. From his remarks the committee members, who were unfamiliar with imported furniture, would be led to believe that the quality of imported furniture was as good as or superior to domestic furniture, and that the Ypsilanti Reed Furniture Co. was vitally interested in the manufacture of grass furniture.

Imported furniture has been brought into the United States for many years, formerly under a 35 per cent duty, and since 1913 under a 15 per cent duty. During the time this furniture was being freely imported, the Ypsilanti Reed Furniture Co. was organized, in 1901, with an authorized capital of $50,000. The capital was increased from time to time as follows: $100,000, $150,000, $175,000, $300,000, at present $500,000.

Their surplus over and above all liabilities and reserves is reported to have increased in the last 3½ years from about $750,000 to about $1,300,000 at present, or an increase of about $550,000, or 75 per cent. This increase was undoubtedly in addition to dividends. Since 1903 this company has operated its factory within the prison walls at Ionia, Mich., where it employed about 500 convicts at a reputed wage of 50 cents per day. In 1913 it erected a building of its own in Ionia, which has been operated with about 1,000 men, in addition to its plant in the prison. We are citing the above in order to show that the only party requesting increased protection has grown from

ry small company to a very large company in a few years, during all of which time irniture has been imported freely at a duty of from 30 cents to 70 cents per chair. ertainly there is nothing in this company's report to indicate that it needs any protection whatever, and were other manufacturers in need of drastic protection they ould have appeared before the committee and have submitted figures and reports prove their contention. While the Ypsilanti Reed Furniture Co.'s phenomenal owth was no doubt due somewhat to its ability to employ convict labor at a very nall wage, still you will find by investigating that the entire reed furniture industry as prospered greatly since being organized. In fact, one of these manufacturers ently purchased, at a cost of $3,000,000, the business of one of its American competitors, in order to secure control of a patent for weaving fiber articles by machinery nd thus reduce competition.

One of the main causes for requiring a revision of tariff is European competition. uropean competition is caused solely by depreciated European exchange. Oriental change is not depreciated; in fact, exchange with China is above normal. Therere, the furniture under discussion is entirely in a different class from the products Europe.

In conclusion we request that you consider the peculiarities of this furniture which ake it different from other imported commodities, in that the freight amounts to ore than the original cost of the furniture, thus affording our manufacturer over 00 per cent protection, plus what he secures under the tariff. We also request that ou keep in mind the fact that this furniture, especially the grass, peel, and rattan, oes not compete with American-made furniture. If you feel that the American eed and fiber furniture requires additional protection, then we request that you emove rattan, peel, and grass furniture from this class and provide a special rate r same. We request that you do not impose a rate over 10 per cent ad valorem ased on American valuation, or over 35 per cent ad valorem based on foreign valuaion, on the rattan, peel, and grass furniture. Any rate in excess of these rates will ake business impossible. In the event the increased revenue which will be derived om these high rates is not absolutely required, we request that you assess lower ates as these rates are not required to protect American manufacturers. We also equest that you specifically provide for peel furniture by including it with grass nd rattan in the lower rate, and that you word the tariff so that rattan, peel, and rass furniture can not be considered as fiber furniture. The term "fiber" is extremely mbiguous, and under the wording as proposed by the House it is quite possible hat the customs or Treasury decisions would consider grass, peel, and rattan as fiber urniture. Possibly the most satisfactory and economical method of levying a duty n this furniture would be on the basis of so much per piece. By levying a duty of 5 cents each on small or children's pieces, 75 cents each on ordinary chairs, rockers, nd tables, and from $1 to $1.25 each on the larger pieces, the result would be to ore than double the present duty, with a minimum in expense of administration. n page 2 you can see how these suggested rates compare with the present duty, nd affect the wholesale selling price.

We have in our possession complete data in regard to the present foreign and doestic costs of this furniture. We also have other data which might be of benefit your committee in determining the rate to be applied. Any information we have ill be turned over to your committee upon request.

TATEMENT OF FRED W. GREEN, REPRESENTING THE YPSILANTI REED FURNITURE CO.

Mr. GREEN. I want to say to you, gentlemen, that our concern as engaged up until 1914 in the manufacture of reed furniture e obtained our supplies from Germany, but at the outbreak of the ar we were not able to get them, so we began the manufacture of eds in addition to the manufacture of reed furniture.

The manufacture of reeds is not a complicated process. They are ade in two ways: One by machine and one by hand. The Chinaman manufactures in both ways. He was not a factor, except in he cheapest hand-made reeds, previous to the war. There is nothng complicated about this process at all. It merely consists in aking and stripping off that hard outer part [illustrating]. This art [indicating] is woven into chairs and seats.

Senator La Follette. That is, the outer part?

Mr. Green. Yes; the outer part. This inner part, or the core is the reed that we are talking about. The outer part is the cane.

The importers into this country were not content with a 10 per cent duty on all these things, but they conceived this term "unmanufactured reed." To me it is not plain. I can not understand where the difference lies. Just what difference does it make whether you take that off with a knife by a machine, or whether you take it off by hand? That is the only question there is as between the manufactured and the unmanufactured reed. But the importers went before the customhouse, and they got decisions both ways. First it was decided that there was no difference between "unmanufactured" and "manufactured" reed; but it was finally decided that there is a difference between the manufactured and the unmanufactured reed. To my mind it is a distinction without a difference. The difference between Chinese hand-cut reed and the other, to a large extent, lies in the quality of rattan that the Chinaman uses to make it. He pulls it through a steel plate that has a series of holes in it. He pulls it through one after the other and gets it down to the size he wants. It would be impossible for him to pull a piece like this [indicating] because it would be too hard and stiff, so he has to make his hand-cut reed out of the cheapest of rattan. It would not pay to bring them over here, because they would not bring any money. The outside of it would be, as one gentleman has already expressed it, trash. The American manufacturers have had to import a good quality of rattan out of which they could get not only the reed, but also the outer part of the cane.

At the time we went into the business, we were perfectly content with the German supply, and the duty of 10 per cent was nothing that interfered with us.

Before the war there was a limited number of people—perhaps two—who manufactured reeds and were not engaged in the manufacture of baby carriages or furniture. With the stopping of the war, there was quite a number. I jotted down the names of eleven concerns that are now engaged in cutting reed in this country: A. L. Randall, Chicago; John A. Dunn Co., Gardner, Mass.; F. A. Whitney Carriage Co., Leominster, Mass.; American Rattan & Reed Manufacturing Co., Brooklyn, N. Y.; United States Rattan Co., Hoboken, N. J.; Heywood-Wakefield Co., Wakefield, Mass.; American Reed & Willow Furniture Co., Wakefield, Mass.; Ypsilanti Reed Furniture Co., Ionia, Mich.; Eastern Chair Co., Gardner, Mass.; L. S. Drake (Inc.), Boston; New England Reed Co., Boston.

I am somewhat surprised at some of the statements made by the secretary of the Baby Carriage Association. I believe that he made them because he did not quite understand or because he was not a manufacturer. Some of them are quite ridiculous. The largest manufacturer of baby carriages, if I am correctly informed, is the Lloyd Manufacturing Co., of Menominee, Mich. They do not use one pound of reed. According to Mr. Ferris's statement, one-third of the baby carriages are made of twisted paper or fiber. Across the table Mr. Ferris could not tell whether they are made of reed or fiber.

Senator La Follette. What do you mean by "fiber"?

Mr. Green. "Fiber" is made of twisted paper. When it is finished, there is not one man out of a number, unless he is an expert

that can stand back and tell the Menominee fiber from the reed; it is so fine that I do not think they can tell it.

As to the question—the quality of hand-cut reed—there are some very smoothly cut samples in this box. They were sent on August 20 from San Francisco, and neither myself nor Mr. Ferris can tell which is hand-cut and which is machine-cut. They are so nearly alike that it is practically impossible to tell.

As to the duty being prohibitive, I wish to make this statement. I have multiplied our selling price (not our cost) by 20 per cent, the rate of duty named in paragraph 411 of the Fordney bill. I have added this 20 per cent to the prices of the corresponding sizes of Chinese reed, both handmade and machine-made, using the price list dated at San Francisco August 20, 1921, and there is no instance in which the Chinese are not still under our price.

Senator SMOOT. With this 20 per cent rate?

Mr. GREEN. Yes. I am going to submit that to you with the Chinese prices, with your permission.

Senator SMOOT. Are you in favor of the 10 per cent?

Mr. GREEN. I am not. I am also opposed to including in any new tariff bill the words "unmanufactured reeds." Under the 10 per cent duty the German importer and the other importers got wealthy, and they collected large sums that should have gone to the United States through the conflicting decisions on the "unmanufactured reed" question. It must be remembered that the Chinaman sells his goods f. o. b. China. There are going to be immense sums of money taken from the United States if this phrase is put back in the tariff.

With reference to another statement that has been made, I want to say that I do not believe there is a carriage manufacturer in the United States who has not used machine or hand cut reeds from China. There is not one of them.

As to the expense of establishing this industry, it is nominal. No one will be kept out of the baby-carriage business because of high costs in connection with manufacturing reed. The highest price we ever paid for a machine for cutting these reeds was $1,350. When I tell you that it would cost a baby-carriage manufacturer approximately $5,000 to engage in this business, I am well within the truth. That does not provide for buildings, but not much room is needed to care for a small furniture or baby-carriage factory.

As to the labor cost of splitting rattan into reeds. There is no one who can do this for 1.5 cents, as has been claimed. It will run between 5 and 6 cents per pound.

I want to say a word in regard to the manufacture of furniture. The Chinese manufacture reed furniture. They have no overhead, as we do. A man comes along, he has a number in his family. He goes back home and starts the thing and the rest of the family make it. There is no overhead. If he gets $3.50 for a chair he thinks he is getting an enormous sum of money. There are some, of course—very large ones—that cost more money than that. A man who has to twist and turn these reeds, has to bend them in all these different shapes, has to have very strong hands. It is very hard work. He has to work at least six months before he is of any value in making good reed furniture. It is difficult to get an American citizen to

work six months to learn a trade. We find that it is very high-priced labor.

There is one thing about it, that is, that it does not always require sight. I know of a factory in Chicago that employs about 20 men on this work. At least 15 of them are blind soldiers.

WILLOW AND WILLOW FURNITURE.

[Paragraph 411.]

STATEMENT OF WILLIAM A. RYAN, REPRESENTING THE UNIVERSAL WILLOW & REED WARE CO.

Mr. RYAN. I wish to confine my remarks to willow furniture—raw material used in the manufactured article as well as the manufactured article.

I call attention to paragraph 411, page 80. In line 4, after the comma following the word "bamboo," insert the words "osier or willow."

Senator SMOOT. Those are the words used in the Payne-Aldrich bill?

Mr. RYAN. They are used further along in the paragraph, but are not specifically mentioned in connection with furniture.

Senator SMOOT. And you want them in both places?

Mr. RYAN. Yes. Then, in line 5, after the comma following the word "grass," insert the word "osier or willow."

Then, on the same page, line 8, strike out "25," in figures, and insert "10," which is the present rate.

Before the war 65 per cent of osier or willow used in the manufacture of furniture was imported from Germany. About 25 per cent came from France. Less than 10 per cent was grown here. To-day there are under cultivation in the United States not more than 500 acres of osier or willow.

In 1919 there was imported willow aggregating $304,696; in 1920, $284,611; and for the six months ended June 30, 1921, $54,053.

As to the manufactured products, before the war there were 100 manufacturers in the United States. At the present time there are about 80. Those are the ones making willow furniture. The capital invested in willow furniture is about $1,500,000; and about 5,000 people are engaged in the manufacture of such furniture.

As to labor conditions in the other countries, they are quite different from those prevailing here. The work there is farmed out to a family and the mechanics finish the job. Here, where our child-labor laws are in effect, the work is necessarily performed by men. Their average hours run about 49½ per week. The average pay for common labor is between 30 and 35 cents per hour. The pay of mechanics and skilled laborers is about 45 cents an hour. In this industry the men have accepted voluntarily a reduction of wages amounting to 25 per cent.

I should like to cover this subject more fully in my brief.

Senator SMOOT. Correct your brief in any way you wish to and hand it to the stenographer.

Mr. RYAN. There is one further point that I would like to call to your attention. There is one article called the Bar Harbor chair.

It is advertised here in the Brooklyn Eagle for $4.95. It costs us to make it $4.75. That is the retail price, delivered anywhere within 100 miles of New York—$4.95.

Senator SMOOT. Is that an imported chair?

Mr. RYAN. It is an imported chair. I will give you figures on our costs in my memorandum.

I thank you very much.

Senator SIMMONS. What did I understand you to say about that ad valorem rate? Did you want that in line 6?

Mr. RYAN. I said line 5—lines 4, 5, and 8.

Senator SIMMONS. Line 8 is the raw material?

Mr. RYAN. Yes.

BRIEF OF WILLIAM A. RYAN, REPRESENTING THE UNIVERSAL WILLOW & REED WARE CO.

PROPOSED CHANGES IN PARAGRAPH 411.

1. On page 80, in line 4, after the comma following the word "bamboo," insert the words "osier, willow."
2. On page 80, in line 5, after the comma following the word "grass," insert the words "osier, willow."
3. On page 80, in line 8, strike out "25" in figures and insert "10" in figures.

So that the paragraph will read as follows:

Par. 411. Reeds wrought or manufactured from rattans or reeds, whether round, flat, split, oval, or in whatever form, cane wrought or manufactured from rattan, cane webbing, and split or partially manufactured rattan, not specially provided for in this section, 20 per centum ad valorem. For the purpose of assessing duties, handmade reeds or cane shall be held to be comparable in value to machine-cut reeds or cane of corresponding size; furniture made with frames wholly or in part of wood, rattan, reed, bamboo, osier, willow, or malacca, and covered wholly or in part with rattan, reed, grass, osier, willow, or fiber of any kind, 50 per centum ad valorem; split bamboo, 2 cents per pound; osier or willow, including chip of and split willow, prepared for basket makers' use, 10 per centum ad valorem; all articles not specially provided for, wholly or partially manufactured of rattan, bamboo, osier, or willow, 40 per centum ad valorem."

This paragraph treats of reeds, rattans, bamboo, and "osier and willow." I shall confine this memorandum to osier and willow, raw material, and willow furniture, as I feel that sufficient has been said touching the other items in this paragraph.

RAW MATERIAL.

I will first touch on the raw material which relates to proposed change 3 above mentioned.

There are under cultivation in the United States not more than 500 acres devoted to the raising of willow.

It is impossible to tell how much willow is grown within the United States, but inquiry among the trade indicates that there is only one grower within the United States that raises a carload of willow a year, and that is his entire output.

For 1919 there was imported osier or willow (raw material) $304,696; 1920, there was imported osier or willow (raw material) $284,611; for the first six months of 1921 there was imported osier or willow (raw material) $54,538.

It will appear upon a cursory examination that there is a great reduction in the importations of raw materials of osier or willow at the present rate of 10 per cent ad valorem. The willow grown here is insufficient in quantity and so inferior in quality that it is not suited for use in connection with willow furniture.

Allowing that there will be as much as $54,538 worth of willow imported into the United States during the last six months of 1921, which would be quite unusual, as the larger importations of willow as a raw material are imported the first six months of the year, this shows a reduction of imports of willow for 1921 of at least 60 per cent. If importations of the raw material which are the chief source of supply to willow furniture manufacturers continue to be reduced, the willow-furniture manufacturers of foreign countries will dominate the American market, and at this time it might be

well to mention the fact that while the raw material has been reduced more than 60 per cent the importations of willow furniture has increased in the same period more than 1,200 per cent.

WILLOW FURNITURE.

This relates to proposed changes 1 and 2.

Before the war there were about 100 manufacturers of willow furniture in the United States. Now there are about 80. They are all small manufacturers. The Universal Willow & Reed Ware Co., which I represent, is the largest willow-furniture manufacturing concern in the United States.

The capital invested by the manufacturers of willow furniture in the United States is more than $1,500,000. The number of people engaged in this industry is about 5,000.

The imports of willow furniture for 1919 were $3,040; 1920, $28,114; for six months of 1921, $35,547.

A cursory examination of these figures shows a 1,200 per cent increase in the imports of willow furniture from January 1, to July 1 1921, a period of six months, over the entire year 1919.

LABOR CONDITIONS.

In other countries the seats and skirts of chairs and other willow furniture are given out to the peasants to work on, and, as a matter of fact, it results in the whole family working from early until late, which gives a very low labor cost of production. Over here we have our child-labor laws protecting children from engaging in this industry. Our workmen have accepted a voluntary cut in their wages of 25 per cent. It was either that or close up shop. Our men work 49½ hours per week. The pay of unskilled labor is between 30 and 35 cents per hour, the pay of our skilled workmen is between 45 and 90 cents an hour at this time, and we have no immediate intention of making any further reduction in wages. We are not at this time paying dividends. The situation is tense, and we are waiting the enactment of the new tariff law, which will enable us to pay dividends and in that way help to support our Government.

In order to give the committee a practical illustration of the very serious condition of our business, I just wish to submit a typical case:

Bar Harbor armchair.—American cost as to labor, $2.35; American cost as to material, $2.16; total, no allowance for overhead, etc., or profit, $4.51.

The Bar Harbor armchair is imported for sale at New York City, delivered anywhere within 100 miles of New York, all charges paid, $4.95; and to any person taking two, why they will sell them at the rate of $4.87½.

We are selling this chair for $5 in quantities and holding our breath for the passage of this tariff bill. We can not keep it up. We do not sell direct to consumers; our price is to large concerns. The price of the imported article given above is selling retail. The above imported chair appeared in the New York market during May and was advertised for $3.95, but finding that they could safely compete they raised the price to $4.95.

It is asserted in many quarters that Germany will not be a very serious competitor for years. So far as willow business is concerned, we are unable to agree with such a proposition. The Willow & Reed Co. has been approached by a representative of a large willow and reed corporation in Germany to give up our factory here and sell the German willow furniture at prices that we could not possibly hope to compete with. We will be pleased to submit to the committee, in confidence, proof of this fact.

In conclusion, I wish to say that willow imports (raw material) at this time show a reduction of at least 60 per cent with a tariff imposed at the rate of 10 per cent. Willow furniture imports at this time show an increase of more than 1,200 per cent during the first six months of 1921 over the whole year of 1919.

If the rate in present law is increased on raw material in so far as willow used in connection with the manufacture of furniture, it will not only wipe out the manufacture here, but the grower here of willow will have no market. We could give you illustration upon illustration as to costs, but the Bar Harbor armchair well illustrates.

CHINESE FURNITURE.

[Paragraph 411.]

STATEMENT OF JAMES F. DONNELLY, REPRESENTING THE MENTZER-PIAGET CO., GRAND RAPIDS, MICH.

Senator SMOOT. Have you a brief that you desire to file?

Mr. DONNELLY. Yes. I prepared a brief.

I am really not here on rattan or willow. It is really Chinese furniture, inserted in paragraph 411.

Heretofore, under the Payne-Aldrich and the Underwood tariffs, this Chinese furniture in which we are interested came under a corresponding paragraph—414.

Senator SMOOT. Are you satisfied with furniture the way it is here?

Mr. DONNELLY. In paragraph 411 they specifically provide for Chinese furniture.

Senator SMOOT. We can put it in here.

Mr. DONNELLY. Under paragraph 411 it provides a duty of 50 per cent, American valuation plan, on Chinese furniture. The ocean and rail freight in itself is twice as much as the Chinese furniture.

Senator SMOOT. You are an importer, are you?

Mr. DONNELLY. Yes, sir.

Senator SIMMONS. What do you want on Chinese furniture?

Mr. DONNELLY. Well, sir, in my brief I have suggested three different ways.

Senator SMOOT. Is there anything made in this country to compare with the Chinese furniture?

Mr. DONNELLY. No, sir; unless made from fiber.

Senator SMOOT. And sea grass?

Mr. DONNELLY. No, sir; they do not make it from sea grass. It is summer furniture.

Senator SMOOT. They are not anything alike? There is nothing like it?

Mr. DONNELLY. Not unless you compare it with fiber furniture.

Senator SMOOT. If "comparable" is taken out, then there is nothing like it in this country?

Mr. DONNELLY. No, sir; not to my knowledge.

Senator SMOOT. Then the American valuation would not apply.

Mr. DONNELLY. How would that work out?

Senator SMOOT. The same as it is to-day. If there is nothing in this country that is similar, it does not apply.

Senator LA FOLLETTE. Supposing there is something similar to it, then the American valuation will be applied. Is there something similar to the Chinese furniture that is coming in?

Mr. DONNELLY. As a manufacturer of furniture or importer, I should say yes. I would say that a fiber chair or an American reed chair would answer the same purpose as the Chinese sea grass.

Senator SMOOT. That is not what the law says. It says "similar."

Mr. DONNELLY. It is similar; it is used for the same purpose; but under the 50 per cent——

Senator SMOOT. The material is entirely different, though?

Mr. DONNELLY. Yes.

Senator SMOOT. Then it does not apply.

Mr. DONNELLY. All right, sir.

Senator SMOOT. I would like to know, provided it did apply, what you would want then.

Mr. DONNELLY. We have suggested, instead of a 50 per cent duty, a 5 per cent duty, or a duty of 75 cents a chair. We are paying now a duty of 32 cents. We possibly could afford 75 cents. But the way it works on the American valuation plan is this: You take a chair that I sell for $15 in the American market; that is, my wholesale selling price; and it is sold at Grand Rapids at that price. As a matter of fact, we are selling it for $9, but we will say $15. Fifty per cent of that would be $7.50. Out of the other $7.50 we would have to pay the cost of the chair, pay the ocean freight of $2 or $2.25, pay the rail freight of $1.81, and, in addition, pay the salesman a commission and allow the customer a 2 per cent discount. It never could be done, sirs. Ordinarily, this furniture has come in under regular household furniture. It was so decided years ago.

I may say that we did not have an opportunity to appear before the House Committee on Ways and Means.

Senator SMOOT. You would like to have it dropped down into paragraph 414?

Mr. DONNELLY. But not at a 25 per cent rate.

Senator SMOOT. You want a 5 per cent ad valorem rate?

Mr. DONNELLY. Yes.

Senator SMOOT. Isn't that too high?

Mr. DONNELLY. Five per cent of the American valuation?

Senator SMOOT. Yes.

Mr. DONNELLY. No; we sell for $9; that would be 45 cents.

Senator SIMMONS. You say you want 5 per cent? Is that your suggestion?

Mr. DONNELLY. Five per cent, or a specific duty.

Senator SIMMONS. You say that would be equivalent to what under the American valuation?

Mr. DONNELLY. In dollars and cents, Senator?

Senator SIMMONS. Yes.

Mr. DONNELLY. Well, we sell that chair for $9. You see, the principal item of cost in this furniture—and it is furniture that does not go into high-class homes——

Senator SIMMONS (interposing). What I am trying to get at is what would be the difference?

Mr. DONNELLY. That would be 50 per cent advance on the present 15 per cent rate.

Senator SIMMONS. That would be due to the American valuation.

Mr. DONNELLY. Yes.

In reading the testimony before the Ways and Means Committee I find that the paragraph is practically inserted verbatim at the suggestion of a domestic manufacturer. We certainly do not compete with this domestic manufacturer. They were organized in 1901 with a capital of $50,000. To-day they are rated over $1,500,000. Possibly some of that profit was secured through advantages that they had. In fact, they employed prison or convict labor. Even so discounting this, there are other manufacturers whose profits have increased in proportion. We do not compete with them. Our furniture does not go into the same class of homes.

Senator LA FOLLETTE. This furniture is sold to people in moderate ircumstances, is it not?

Mr. DONNELLY. Yes.

Senator SMOOT. I do not think it is moderate-priced furniture if a hair costs $15.

Mr. DONNELLY. I said $9. I said, admitting we could get $15, which we could not——

Senator SMOOT. Oh, well——

Mr. DONNELLY. Even at $9, we have to pay $4.50.

Senator SIMMONS. You say that you sell this chair for $9. What oes the chair manufactured in China sell for?

Senator SMOOT. That is the chair.

Mr. DONNELLY. That would cost in the neighborhood of $4, Hongong currency, or, at the present rate of exchange, about $2.25.

Senator SIMMONS. It gets to you at $9?

Mr. DONNELLY. As to this $9 chair, to bring it over on the ocean osts us from $2 to $2.25; and the rail rate for freight from Seattle r San Francisco to the market would be in the neighborhood of $2 er chair.

Senator SMOOT. Don't you land in New York? Why don't you and the furniture there?

Mr. DONNELLY. No; we do not.

Senator SMOOT. Why do you land on the coast?

Mr. DONNELLY. Because at the present time there is a steamship ine that makes regular hauls, and, in addition, we can ship by way f the Pacific coast because the American Shipping Board has regular ailings and they have a regular $8 rate from either San Francisco r Seattle to Chicago or New York. It is a transcontinental freight ate.

Senator SMOOT. You may file that brief.

RIEF OF JAMES F. DONNELLY, REPRESENTING THE MENTZER-PIAGET CO., GRAND RAPIDS, MICH.

As importers and distributors of Chinese sea-grass and rattan furniture provided r in Schedule D, paragraph 176, of the tariff act of 1913, we desire to direct your ttention to the proposed change in rate of duty as provided in Schedule 4, paragraph 11, tariff bill H. R. 7456.

The following brief is respectfully submitted that members of Senate Finance ommittee may be in possession of the facts before passing on a measure which in ffect will constitute an absolute embargo on Chinese sea-grass and rattan furniture.

The proposed tariff bill (H. R. 7456) as relates to Chinese sea-grass and rattan furniure would increase the present rate of duty over 3,900 per cent.

As Chinese sea-grass and rattan furniture is not made in America, this prohibitive uty is not needed to protect home industries. In fact the only advocate for an ncrease in rate of duty on this commodity to appear before the Ways and Means ommittee was Mr. F. W. Green, representing the Ypsilanti Reed Furniture Co., onia, Mich., which was incorporated in 1901 with a capital of $50,000, which has been ncreased from time to time, and at present this firm is rated at over $1,500,000.

If the tariff is designed to increase revenue it defeats itself, as the duty is so excesive it would prohibit all importations, thus depriving the Government of a substanial revenue.

Under the Payne-Aldrich tariff (1909–1913) Chinese sea-grass and rattan furniture, hief value wood, was dutiable under Schedule D, paragraph 215, at 35 per cent on oreign value.

Under the Underwood tariff (1913 to date) Chinese sea-grass and rattan furniture, hief value wood, is dutiable under Schedule D, paragraph 176, at 15 per cent on oreign value.

Under the proposed Fordney tariff Chinese sea-grass and rattan furniture, chief alue wood, would be dutiable under Schedule 4, paragraph 411, at 50 per cent on American valuation.

IS A DUTY SIX TIMES THE COST OF THE CHAIR ITSELF A JUST DUTY?

Compare the duties on a chair costing $2.14 United States currency in China:

Payne-Aldrich (1909–1913)	$0.749
Underwood (1913 to date)	.32
Fordney (proposed)	12.85

This is an increase of over 3,900 per cent. It is prohibitive. It amounts to an embargo on the products of a friendly republic, to the relief of whose suffering people America recently gave millions.

IN EFFECT A DUTY ON FREIGHT RATES.

The ocean and rail freight is approximately twice the cost of the goods in China. Under the American valuation plan the duty as imposed is a duty on the transportation costs as well. This plan may not seriously affect importations on which the freight is a small item, but on bulky articles like Chinese sea-grass and rattan furniture where freight is a major item of cost, the American valuation plan will automatically more than double the value on which duties are assessed.

Merchandise has a certain intrinsic value, and while supply and demand determine the "fair market value" to a certain extent, there is always a limit to what may be obtained for merchandise, and as Chinese sea-grass and rattan furniture is essentially merchandise that goes into the average citizen's home it can not be marketed at any fancy price.

We estimate $9.10, the present wholesale selling price, as the maximum wholesale selling price, based on years of experience as importers and a knowledge of trade conditions.

WHAT IS A FAIR DUTY?

A study of the cost sheet attached will show that the proposed duty is prohibitive. A duty of 5 per cent on the American valuation plan would be about the maximum that an importer of Chinese sea-grass and rattan furniture could pay and continue to do business.

We ask therefore that portion of paragraph 411, page 80, line 3 (H. R. 7456), be changed to read—beginning with the word "furniture":

"Furniture made with frames wholly or in part of wood, rattan, reed, bamboo, or malacca, and covered wholly or in part with rattan, reed, grass, rattan peel, or fiber of any kind, 5 per centum ad valorem."

Or a substitute based on a specific duty as follows:

"Small pieces, 35 cents; regulation chairs and rockers, 75 cents; larger pieces, such as settees, lounges, recliners, extension chairs, etc., $1.00."

With the application of the American valuation plan this shows an increase of approximately 50 per cent over the present rate of duty. Where we are now paying $0.32 on No. 22 chair we would be paying $0.45½ on a 5 per cent ad valorem duty.

Under a specific duty of 75 cents a chair, the increase in duty would be approximately double that obtained under the present rate.

We have gone into some detail in an endeavor to cover this matter in a complete and comprehensive manner. If there is any point upon which you desire further information we will be glad to submit it. In all cases where we have quoted figures we have been very conservative and have sincerely tried to present the facts to you. Further, when we state that if the proposed tariff was to become effective we would be compelled to discontinue business we are stating the absolute truth. This tariff would not act as a revenue producer but as an absolute embargo on Chinese sea-grass and rattan furniture.

Detailed costs of a typical Chinese sea-grass chair (No. 22) under present tariff, under proposed tariff, under a duty of 5 per cent of American valuation, and under a specific duty of 75 cents a chair.

[Wholesale selling price f. o. b. Grand Rapids, Mich. Terms, 2 per cent, 30 days.]

Items of cost.	Chair measures 11¼ cubic feet, weighs 22 pounds packed. Hongkong cost, $3.90 Hongkong currency.			
	Costs under present duty of 15 per cent of foreign valuation.	Costs under proposed duty of 50 per cent of American valuation.	Costs under a duty of 5 per cent of American valuation.	Costs under duty of 75 cents a chair.
Cost of chair in United States currency (exchange of $0.55 on Hongkong currency of $3.90)	$2.14500	$2.14500	$2.14500	$2.14500
Marine insurance, stamps, consular fees, etc., about	.02145	.02145	.02145	.02145
Shippers' commission, 5 per cent of cost	.10725	.10725	.10725	.10725
Ocean freight, at $8 per ton of 40 cubic feet, on 11¼ cubic feet	2.25000	2.25000	2.25000	2.25000
Marking each bale of 2 pieces, at 7 cents per bale	.03500	.03500	.03500	.03500
Forwarding agents' charges, bale of 2 pieces, at 7½ cents per bale	.03750	.03750	.03750	.03750
Incidental charges, including revenue stamps on entry, bond fees, cartage to appraisers' stores, etc	.01600	.01600	.01600	.01600
Rail freight at $8 per hundredweight on 22 pounds, plus war tax	1.81280	1.81280	1.81280	1.81280
Salesmen's commission and trade discount, approximately 10 per cent	.91000	2.57000	.92500	.96000
Total cost, excluding duty	7.33500	8.99500	7.35000	7.38500
Duty	.32175	12.85000	.46500	.75000
Total cost, including duty	7.65675	21.84500	7.82500	8.13500
Importers' profit (which includes rent, office expenses, etc.), approximately 20 per cent	1.45000	3.85500	1.42000	1.47000

BROOM HANDLES.

[Paragraph 414.]

STATEMENT OF SAMUEL WASSERMAN, NEW YORK CITY.

It appears that broom handles under paragraph 414 of the Fordney bill are to bear a duty of 25 per cent ad valorem, to which we are opposed. They are now on the free list, and there is every reason why they should remain there.

There are between 35 and 40 broom-handle factories in the United States. There are about 1,000 establishments, consisting of factories, penal institutions, and institutions for the blind engaged in the manufacture of brooms, with an output of about 50,000,000 brooms annually. These establishments are spread all over the country from coast to coast. Broom corn, the raw material used in the manufacture of brooms, is grown principally in Kansas, Missouri, New Mexico, Illinois, Oklahoma, and Colorado. Wire, twine, nails, and velvet also enter into the manufacture of brooms. Amsterdam Broom Co., of Amsterdam, N. Y., represented by the undersigned, the largest broom factory in the United States, with a capacity of 12,000 brooms daily, is running at present about 25 per cent normal. This concern has been in business for nearly 40 years, employs when running full several hundred men, and has a large wage list.

Broom handles are made out of the following hard woods: Beech, birch, and maple. Hardwood lumber costs about $40 per thousand feet. About 1,700 handles can be manufactured from 1,000 feet of hardwood lumber. The cost of manufacture of the handles runs from about $5 to $7 per thousand, according to factory conditions. This would bring the cost to the manufacturer of the handles to about $30 per thousand for the first grade. The present selling price is about $50 per thousand. The prevailing prices for broom handles before, during, and after the war are as follows: Before the war, $18 to $20 per thousand; during the war, $80 per thousand; after the war, $50 per thousand.

These prices can be substantiated by invoices in my possession, and which are at the disposal of this committee. During the war it was almost impossible to obtain the necessary supply of broom handles at any price. This country's supply of beech, birch, and maple, the hard woods used in the manufacture of broom handles, is very limited, and our forests are now being denuded of these very valuable hard woods, which could be much better utilized in building homes. We should, therefore, welcome the importation from other countries of the hard woods necessary to make broom handles. Putting and keeping broom handles on the free list has the effect of stabilizing prices, so that broom-handle manufacturers here can not charge an unreasonable price for their product. Broom handles on the free list will also enable the broom manufacturer to turn out his finished product, the broom, at a lower price. Broom handles on the free list will enable the consumer to reap the benefit.

Broom handles on the free list will not injure the broom-handle manufacturers, as they are to-day receiving more than a fair margin of profit and need no protection. If a duty is put on broom handles, it will encourage the handle manufacturer to raise his prices even above that now prevailing. This household necessity, the broom, is in the possession of and purchased by every thrifty and careful housewife in the land and should not be called upon to bear the burden of any duty. The broom manufacturer, in competition with the vacuum cleaner, carpet sweeper, and other devices, has a difficult time, indeed, in making both ends meet and putting out an article at a moderate price.

We have no knowledge of the broom-handle manufacturers having requested this tariff. They have always prospered without it and do not require it now, while many broom manufacturers have requested at prior tariff hearings that broom handles be placed and kept on the free list. Furthermore, it would be such a small source of revenue to the Government as to be negligible.

INDEX TO SCHEDULE 4.

HEARINGS

BEFORE THE

COMMITTEE ON FINANCE

UNITED STATES SENATE

ON THE PROPOSED

TARIFF ACT OF 1921

(H. R. 7456)

SCHEDULE 5

SUGAR, MOLASSES, AND MANUFACTURES OF

Revised and Indexed

WASHINGTON
GOVERNMENT PRINTING OFFICE
1922

COMMITTEE ON FINANCE.

BOIES PENROSE, Pennsylvania, *Chairman.*

PORTER J. McCUMBER, North Dakota.
REED SMOOT, Utah.
ROBERT M. LA FOLLETTE, Wisconsin.
WILLIAM P. DILLINGHAM, Vermont.
GEORGE P. McLEAN, Connecticut.
CHARLES CURTIS, Kansas.
JAMES E. WATSON, Indiana.
WILLIAM M. CALDER, New York.
HOWARD SUTHERLAND, West Virginia.
FURNIFOLD M. SIMMONS, North Carolina.
JOHN SHARP WILLIAMS, Mississippi.
ANDRIEUS A. JONES, New Mexico.
PETER G. GERRY, Rhode Island.
JAMES A. REED, Missouri.
DAVID I. WALSH, Massachusetts.

LEIGHTON C. TAYLOR, *Clerk.*
W. B. STEWART, *Assistant Clerk.*

II

NOTE.

Believing the greatest demand for the Tariff Hearings before the Senate Finance Committee on H. R. 7456 will be only for those schedules containing the particular items in which each individual is interested, the preliminary prints have been revised and indexed and printed by schedules.

The hearings are paged consecutively and comprise the following separate documents:

American Valuation.
Dyes Embargo.
Schedule 1.—Chemicals, Oils, and Paints.
Schedule 2.—Earths, Earthenware, and Glassware.
Schedule 3.—Metals and Manufactures of.
Schedule 4.—Wood and Manufactures of.
Schedule 5.—Sugar, Molasses, and Manufactures of.
Schedule 6.—Tobacco and Manufactures of.
Schedule 7.—Agricultural Products and Provisions } combined.
Schedule 8.—Spirits, Wines, and Other Beverages } combined.
Schedule 9.—Cotton Manufactures.
Schedule 10.—Flax, Hemp, and Jute, and Manufactures of.
Schedule 11.—Wool and Manufactures of.
Schedule 12.—Silk and Silk Goods.
Schedule 13.—Papers and Books.
Schedule 14.—Sundries.
Schedule 15.—Free List.
Special and Administrative Provisions, and Appendix containing briefs received too late for printing in the volume containing the hearings upon the various schedules.

LEIGHTON C. TAYLOR, *Clerk*.

SCHEDULE 5.

SUGAR, MOLASSES, AND MANUFACTURES OF.

CUBAN SUGAR.

[Paragraph 501.]

STATEMENT OF EDWIN F. ATKINS, REPRESENTING E. ATKINS & CO., BOSTON AND NEW YORK.

Mr. ATKINS. My name is Edwin F. Atkins; I represent E. Atkins & Co., Boston and New York.

Senator McCUMBER. And your business?

Mr. ATKINS. Our primary business is that of sugar importers and managers of sugar estates.

I am also president and director and manager of several sugar estates in Cuba.

Senator McCUMBER. Mr. Atkins, you can make your own statement in your own way. I will ask that Senators allow Mr. Atkins to proceed and get through before any questions are asked.

Mr. ATKINS. I prepared a brief when I was asked to come here on September 2, but for the sake of brevity I propose to give you a statement embodying the salient points of that brief, instead of attempting to read the brief here, which would take too much time; and then the brief will be presented later for publication, if it is your pleasure to do so.

An experience of over 40 years in the island of Cuba, coupled with the substantial character of the American interests which I represent, justifies, I feel, my request to appear before you and make protest against the enactment into law of the rates upon sugar proposed by the Fordney bill. I speak primarily for American interests, but I also appear as a friend and coworker with the Cuban people, with whom for nearly half a century I have been associated.

The rates proposed are higher than the duties in either the McKinley, Wilson, Dingley, Payne-Aldrich, or Underwood tariff acts. They are higher than any duties which have been imposed upon sugar in over 30 years. Recognizing, however, that the demands of the Federal Government require an increase in its revenues, I realize that your committee must be shown that either the proposed rates will not produce the expected revenue or that there are special reasons why the rates should not be made effective. The objections to the bill to which I wish to call your attention are as follows:

The rates are so high that they will check importations and reduce revenues. Cuba is in dire financial straits, and instead of aiding her in her hour of distress this bill will create a more serious situation than now exists in the island.

Cuba is one of the best customers America has, and America's own business interests are threatened by the proposed bill.

After freeing Cuba from Spanish rule, we undertook a wardship unique in the history of international relations. As a result of that wardship we are morally bound to help Cuba and not to injure her.

The second paragraph of the proposed sugar schedule, which permits certain domestic manufacturers to import sugar "at three-fourths of the rate of duty to which such sugar would otherwise be subject," is not only a domestic class discrimination, but it is apparently a violation of our treaty with Cuba.

Now, I want to touch upon the conditions in Cuba.

Between June and December, 1920, the price of Cuban raw sugar dropped from 22½ cents to 3½ cents per pound. The phenomenal drop in price from the highest known since Civil-War days to the prewar level has caused the greatest distress. The past six months have been but a series of bankruptcies, insolvencies, and failures of the most prominent banking and commercial firms of the islands. As a result, to-day practically the entire banking business of the island is in the hands of American and Canadian banks, the success of which is entirely dependent upon Cuba's sugar industry.

Unfortunately, the disaster which Cuba has suffered was not confined to her banks and to her men of wealth, but the greatest distress has come upon the laboring class. Upon the mills ceasing to grind at the end of the season—that was last May and June—many estates found they could not pay their laborers. In the absence of money, men were paid off with vouchers, and the laborers were forced to accept the pay vouchers which locally passed as currency and had to be accepted as the estates had nothing better to offer.

Under the conditions which confronted them, those laborers who could find passage money left the island either for their homes in Spain, Haiti, Jamaica, or the Canary Islands. Those who could not do so were forced to remain and make the best of the situation. They are now not only out of work, but they and their families are in absolute want. Such of the laboring element as is able to leave the island will probably not return, and a shortage of labor for the coming crop is certain.

I might add here that many of the passages of these laboring people are paid either by the Cuban Government or by the Spanish Government, in order to assist them.

Many Cuban producers are being forced into bankruptcy, and the condition of the Cuban farmers and laborers is most serious. Banks and bankers have large sums outstanding as loans to the estates, which can not be collected except through the prosperity of the sugar industry.

American exporters of goods to Cuba have some $125,000,000 of uncollectible bills outstanding, their correspondents being unable to pay owing to their inability to collect. In many of the country districts the grocery stores have been closed, the storekeepers being unable to obtain supplies from their customers; that is, they can not buy because they can not pay. The small farmers or colonos, as well as the large sugar estates, with few exceptions, have been unable to employ labor during the past months. All the Cuban banks, with the exception of some private institutions, were forced to close, and

the island is entirely dependent now upon the banking institutions of the United States and Canada, which, through force of circumstances, have been obliged to restrict credits to a minimum. In many districts the country people are suffering from hunger and are without proper clothing and the necessities of life. Women and children and many laboring men are being fed by charitable societies and such of the sugar estates who have any means at their disposal, also through municipal governments. These conditions have given rise to grave fears of political disturbances and attacks upon property which may call for American intervention.

I might add here that I am speaking in regard to the conditions of these people from actual experience. I have been taking care of a great many of these people, and I know that many other estates have been doing the same through the summer time, because they could not give them employment and they have been simply feeding them out of charity.

Under the reciprocity treaty with Cuba, following the peace treaty with Spain, known as the treaty of Paris, special concessions were granted by Cuba to the United States amounting to from 20 per cent to 40 per cent preferential duties, and in return the United States accorded a 20 per cent preferential on Cuban sugar and other products. Trade thereafter between the United States and Cuba showed a tremendous gain.

Previous to the Spanish-American War our exports to Cuba were approximately $25,000,000 per annum. Last year, as shown by the Statistical Abstract of the United States, our exports were over $500,000,000. These exports comprised pretty much all of Cuba's requirements, and report of the department of commerce of the Cuban Government for 1919 giving imports into the island from all parts of the world showed that the United States had furnished 78 per cent of all Cuban imports. The balance of her imports not coming from the United States were composed of merchandise and articles not produced here, or with such articles with whieh we could not compete in price. Since the Spanish-American War Cuba has always been one of our best customers, but last year she rose from the seventh place to the fourth; that is, she occupied the fourth place as among our customers purchasing from the United States; her purchases amounted in value to 80 per cent of all merchandise purchased by South American countries.

I submit a tabulation giving the values of the principal commodities exported by the United States to Cuba in 1920, the last figures available. A glance at this list makes it clear that any injury to Cuba's buying power will immediately affect American manufacturers. This is a condensed list taken from a very long list of all the exports, and this, I think, is accurate. I will only touch upon a very few of the leading articles that go to Cuba:

Wheat flour, $17,000,000, and then comes automobiles, $14,000,000; freight cars, $10,000,000; bituminous coal, $13,000,000; textile goods, $60,000,000; wearing apparel, $14,000,000; foodstuffs of all kinds, nearly $63,000,000; oil and grease, $13,000,000; manufactures of iron and steel, $26,000,000; locomotives, $8,000,000; sugar-mill machinery, $13,000,000. That machinery comes from Ohio, largely; Birmingham, Ala., and various points in New York State and Michigan; a good deal of it comes from Detroit. Steel rails, over

$7,000,000; parts of other machinery, more than $17,000,000; boots and shoes, $21,000,000.

Now, those exports go from my own country—that is, the New England States, very largely Massachusetts. They have taken all of the trade of Cuba in boots and shoes. Manufactures of leather, $2,000,000; paper and bags, $7,800,000; soaps, $1,251,000. Here is pitch pine and railroad ties, shipped principally from our Southern States, over $15,000,000; manufactures of wood, $2,500,000; boilers and parts, over $5,000,000.

I will not tire you with the other items, but simply say that the entire value of these exports last year exceeded $500,000,000.

Of products of our farms, we shipped nearly $15,000,000 of lard; of hams and shoulders, over $5,000,000; of corn and oats, over $5,000,000; of sausage, $2,500,000; and of cheese, $1,000,000. Of cattle and hogs we shipped $3,500,000; condensed milk, I think, $8,000,000. We also sold to Cuba fertilizers to the extent of $8,000,000.

The list I submit is an imposing one and concerns sending over $500,000,000 of products of various kinds to Cuba were American concerns doing business in the island and fully as dependent upon her welfare as the grower of cane in the island itself.

As President McKinley so wisely said in his address at Buffalo:

> We must not repose in fancied security that we can forever sell everything and buy little or nothing.

The Fordney bill will reduce the buying power of Cuba with the inevitable loss of trade to countless American concerns of whom she is a customer.

The statistical abstract of the United States for 1920 shows that we paid Cuba for that year $721,000,000. As she purchased from us about $515,000,000, it will doubtless be said that the balance of trade of $206,000,000 was against America, and for that reason Cuba took more than she gave. Such a statement would overlook two vital considerations:

First. The value of imports from Cuba do not represent money payments sent to the island. The investment and ownership by American interests in Cuba means that very large sums are paid to these American interests in the shape of dividends, interest charges, transportation, etc, which would more than offset the figure given as the balance of trade in Cuba's favor.

Second. Since the American occupation there has been a tremendous increase by the United States in its participation in Cuban business enterprises.

I have stated that fully $125,000,000 is due to American exporters. One of the largest items of this indebtedness is due for sugar machinery which has been sold partly upon installments. The cotton-textile people who have formed a creditor's protective committee advise me that they have at least $6,000,000 in outstanding accounts.

I might add that this is the New England interests alone; that does not include the southern cotton exporters, nor does it include the woolen textiles. This does not include woolen goods or wearing apparel. Manufacturers of boots, shoes, ladies' hosiery, canned goods, fertilizers, automobile parts, automobiles, railroad supplies, steel rails, and the oil people all have debts due them, the payment of which is dependent upon the success of Cuba's sugar industry.

Those people who have outstanding accounts in Cuba are some of the best known firms in the United States in all lines of business.

Others submit in more detail than I can furnish the total holdings of the American interests in the island. It is my belief that one thousand millions of dollars is a low estimate for the approximate total of American investments there.

The Fordney rates made permanent will work great harm to Cuba's sugar industry and impose an unjust burden upon American consumers.

I am sure that our opponents will say that the producers have paid this additional duty, which I concede. Whenever there is an overproduction of any article the price declines and the producers in order to get into this country have to reduce their price. After awhile those low prices will reduce the production, prices will advance, and then the consumer must pay the duties to which I refer here. I think that people have been very much befogged and misled on that principle. It is a simple rule of supply and demand. When you have a supply exceeding the demand the prices go down and vice versa. This Fordney bill will destroy in a great measure our large export trade to the island and make impossible the collection of several hundreds of millions of dollars due to our banks and to our exporters, which can not be collected unless the sugar business of Cuba prospers.

I have tried to show that commercial reasons of the highest importance demand that we promote the welfare of Cuba. There are, however, reasons of still more weight that render it imperative that we do not jeopardize Cuba's international standing.

Modern historians, in seeking the cause of wars and international misunderstandings, lay great weight on economic conditions. Spain sought to protect her own interests at the expense of Cuba and enacted legislation entirely with a view to her own benefit. This legislation not only related to the tariff but to shipping, various forms of excise taxes, and the innumerable devices which monarchies are known to make insufferable to colonial governments.

I submit that with some authority, because I was in Cuba previous to these developments. I cautioned my Spanish friends about the course they were pursuing, telling them they would lose the island unless they treated Cuba with more justice.

As long as the European countries were dependent upon the West Indies for the greater part of their sugar supply, Cuba had the buyers of Europe competing with those of the United States, but as time passed the continental countries of Europe all became producers of beet sugars and levied heavy duties against foreign imports. Then their markets were closed to Cuba. Since their production exceeded their consumption requirements, export bounties were paid which enabled them to sell free trade England at prices below the cost of production. Cuba could no longer compete there and so became dependent upon the United States. Fortunately for her a countervailing duty, in addition to the regular tariff, had been imposed by the United States against those countries paying an export bounty, and the United States became the market for her sugar.

In 1890 the McKinley tariff bill was passed and by what was known as the Aldrich amendment power was conferred upon the President of the United States to negotiate treaties of reciprocity which would

admit sugar free of duty from such countries as would make concessions in their tariffs upon American merchandise. Under the power so conferred a treaty of reciprocity was negotiated with Spain and afterwards similar treaties were made with the principal sugar-producing countries of the world, and the United States tariff on sugar was practically abolished; so our exports with Cuba rapidly increased; the cost of food supplies in Cuba was greatly reduced, and the island entered upon a period of prosperity such as it had not known for many years.

In 1894 the change from a Republican to a Democratic administration at Washington was followed by the passage of the Wilson tariff bill which again placed a duty upon sugar, canceled the reciprocity treaties, and brought a return to the Spanish tariff rates in Cuba. Prices of sugar declined, while cost of living increased and as the estates finished their crops in the spring of 1895, all work on the plantations ceased. Thousands of laborers were suddenly thrown out of employment, and unable to gain a livelihood took to the woods and joined the ranks of the insurgents. The destruction of property, the loss to commerce, and the reduction of Cuba's sugar crop in one year from 1,040,000 to 230,000 tons, with the Spanish-American War which followed, are now matters of history.

So it was in fact economic troubles that sent Gens. Gomez, Maceo, Marti, Garcia, and others to the fields in their ultimately successful struggle for independence.

To correct this situation the United States went to Cuba's aid, freed her from Spain and in the process let in Porto Rican sugars, as well as Philippine Island sugars, free of duty. The Fordney bill proposes to put on a duty higher than has existed in 30 years. If we do it and bring about a serious curtailment of Cuba's sugar industry, we are not only violating our international obligation to Cuba but setting in motion economic forces the result of which I hesitate to predict.

When Cuba accepted as a part of her constitution the Platt amendment, which gave the United States the "right to intervene for the preservation of Cuban independence, the maintenance of a government adequate for the protection of life, property, and individual liberty," she at the same time agreed that she would "never enter into any treaty or compact with any foreign power or powers which will impair or tend to impair the independence of Cuba, nor in any manner authorize or permit any foreign power or powers to obtain any colonization, or for military or naval purposes, or otherwise, lodgment in or control over any portion of said island."

In addition to this provision Cuba is, of course, debarred by the Monroe doctrine from affiliating with any foreign nation, has she any desire so to do. The result is that Cuba is in every way, politically, financially, commercially, and industrially tied up with the United States and anything which threatens to injure her will inevitably injure this country.

In 1901 Elihu Root, who was the Secretary of War, spoke unreservedly in favor of this country granting tariff concessions to Cuba, and declared:

> Aside from the moral obligation to which we committed ourselves when we drove Spain out of Cuba and aside from the ordinary considerations of commercial advantage involved in a reciprocity treaty, there are the weightiest reasons of American publ[ic]

olicy pointing in the same direction; for the peace of Cuba is necessary to the peace of the United States. The same considerations which led to the war with Spain now require that a commercial agreement be made under which Cuba can live. The condition of the sugar and tobacco industries in Cuba is already such that the earliest possible action by Congress upon this subject is desirable.

President Roosevelt in a special message to Congress urging reciprocity with Cuba said:

In the case of Cuba * * * there are weighty reasons of morality and of national interests why the policy should be held to have a peculiar application, and I must earnestly ask for your attention to the wisdom, indeed to the vital need, of providing for a substantial reduction in tariff duties on Cuban imports into the United States. Cuba has in her constitution affirmed that she should stand, in international matters, in closer and more friendly relations with us than any other power, and we are bound by every consideration of honor and expediency to pass commercial measures in the interest of her material well-being.

This obligation to stand by Cuba was thoroughly recognized by our Government in 1902 and, I believe, is recognized to-day. But a tariff bill which proposes rates which will require Cuba to pay substantially more than those in effect when President Roosevelt asked Congress to reduce the import duties, will not promote the "closer and more friendly relations" desired by our Government.

I want to touch on the second paragraph of the Fordney bill, which apparently violates the treaty with Cuba.

The second paragraph of the Fordney bill provides that for every pound of domestic sugar used, a refiner can import 2 pounds of foreign sugar at three-fourths of the regular duty. If such imports consisted of full duty sugars paying 2 cents per pound, such as Javas, for instance, the effect would be that such sugars would pay less duty than Cuban sugars.

In the reciprocity treaty providing for admittance of Cuban merchandise at 20 per cent less than the tariff rates, appears the following:

The rates of duty herein granted by the United States to the Republic of Cuba are and shall continue during the term of said convention preferential in respect of like imports from other countries.

If the Fordney bill is enacted, domestic manufacturers or refiners coming within the scope of this paragraph, could import full-duty-paying sugars at 25 per cent less than the full tariff rates; and they could be imported by the beet sugar factories or Louisiana refiners at a duty of 1.50 cents per pound while Cuba pays 1.60 cents. The object of the treaty with Cuba was to give to the island a preference of 20 per cent over all like imports from other countries. Manifestly any tariff act that prevents the complete carrying out of our treaty obligations with Cuba would be a breach of international faith, which I can not believe the Government of the United States intends to commit.

One of the representatives of the refiners, whom I think is present, can elaborate a little upon the refining end of that paragraph.

Senator Smoot. Mr. Chairman, I do not know whether Mr. Atkins can answer the questions I want to put to him or whether the gentleman who is trying to tell him what I am saying can follow the exact words as I say them.

Senator McCumber. Perhaps if you use his speaking tube you can carry on your examination without difficulty.

Senator Smoot. All right; I will try that method.

Mr. Atkins, you have always been opposed to the creation of a beet-sugar industry in the United States, have you not?

Mr. ATKINS. Certainly not; I deny that most emphatically. At one time I was the representative of the largest holders of beet-sugar stocks in the United States.

Senator SMOOT. I am aware of that, Mr. Atkins, but let me read you your testimony. You are perfectly willing to stand by your testimony given before the committee in the House?

Mr. ATKINS. If I have not been misinterpreted. Let me see it.

Senator SMOOT. I will read it to you. This was before the Hardwick sugar investigation committee, 1912 [reading]:

> Mr. MADISON. You stated a moment ago, Mr. Atkins, or this morning, that you decidedly opposed going into the beet-sugar business. What was the reason of that?

That was a question that Mr. Madison asked you. I want to read you your answer—not what you are going to say now, but what you did say [reading]:

> Mr. ATKINS. The beet-sugar business was a competitive business. It produced in the western territories, where our market lay. That is, I say, "our market"—I mean the market of the refiners, the various refiners, of the United States. As that industry grew—and I foresaw that it would grow rapidly—I believed that it would reduce the volume of business not only of the American Sugar Refinery Co. but all the refineries on the Atlantic coast; and although we had millions of dollars invested in the business there we were building up a competitive business, one that would compete with ourselves, and which was bound to get away from us; we could not control it in the end. I say "we"—I had no connection whatever with it. That was simply a business man's opinion.
>
> Mr. RAKER. How far west do you ship?
>
> Mr. ATKINS. We ship, when we are able to do so, out to Omaha and Kansas City.
>
> Mr. RAKER. You ship no further west than these points?
>
> Mr. ATKINS. We would if we could, but we can not get in there owing to the competition of the beet factories.

I am not going to read any more of your testimony, but that is what you testified in 1912, and that is why I asked you if you are not opposed to the creation of the beet-sugar industry in the United States.

Mr. ATKINS. Mr. Chairman, if you will bear in mind that that was an examination by the—whatever is the name of that committee—

Senator SMOOT (interposing). The Hardwick committee.

Mr. ATKINS. An examination of me as the representative and chief of the American Sugar Refining Co. My testimony was given there with that only in view, and when I speak of opposing the policy of the American Sugar Refining Co. in entering upon this beet business, I did so because I thought it was inconsistent for them to be on both sides. They could not follow up, as they should do, the beet-sugar industry and also the refining business.

Senator SMOOT. You do not say that in your testimony. You spoke for the American Sugar Refining Co., and you were at the head of that concern. Did you speak for all of the sugar refiners in the United States?

Mr. ATKINS. Exactly, sir. I intended to speak for every refiner, because the business of the American Sugar Refining Co. was the refining business of the United States, and I knew that the rapid development of the beet sugars would gradually drive them back, and it has been proven to be so.

Senator SMOOT. Certainly. Nobody contends that it has not been a competitive business of the sugar refineries themselves, the same as evidently appeared in 1911 when the sugar refiners would have

laced a price upon the sugar in the United States on account of ck of sugar in that year that would have made the American eople pay more money than all of the beet-sugar refiners in the nited States had cost them.

Mr. ATKINS. I beg to take exception to that statement. The sugar finers would never care to do such a thing as that.

Senator SMOOT. They did it up to November.

Mr. ATKINS. Not at these extréme prices.

Senator SMOOT. Absolutely, and I can prove it. You say that the igar producers are in dire financial straits?

Mr. ATKINS. Yes.

Senator SMOOT. Do you not know that the beet-sugar people are i just as dire straits, financially?

Mr. ATKINS. I am fully aware of that, Mr. Chairman.

Senator SMOOT. But you are perfectly willing they should be?

Mr. ATKINS. No, sir; I am not perfectly willing that they should e. I will tell you, if you will listen one moment, that when I came own here after the last change of the tariff I made as strong a plea s I could in favor of the beet-sugar manufacturers having sufficient rotection, which we settled upon at that time to the satisfaction of verybody, a cent a pound against Cuba.

Senator SMOOT. You say "to the satisfaction of everybody." Who do you mean by "everybody"?

Mr. ATKINS. I mean the beet-sugar producers as well as every-ody else.

Senator SMOOT. Then I deny that. Cuba is a fair customer of ours, s she not?

Mr. ATKINS. Yes.

Senator SMOOT. She has preferential rates on all exportations, does he not, of 20 per cent, and we have a preferential rate on all goods oing into that country?

Mr. ATKINS. From 20 to 40 per cent.

Senator SMOOT. If she could buy her goods cheaper anywhere else here is where she would buy.

Mr. ATKINS. She can not buy them, under treaty.

Senator SMOOT, Oh, yes; she can. She can buy anywhere she wants to. But she gives the American manufacturer 25 per cent dvantage.

Mr. ATKINS. If she can do it, there is no reason why she should not buy somewhere else.

Senator SMOOT. Oh, yes; but you said she could not.

Mr. ATKINS. She can not break with the United States on account of treaty.

Senator SMOOT. The treaty does not bind her from buying goods anywhere on earth. Cuba was responsible, was she not, for the mportation of nearly 800,000 tons of sugar into the United States rom Java and from other parts of the world, when Cuba was trying o hold the price up to 24, 25, and 26 cents a pound, was she not?

Mr. ATKINS. No, sir.

Senator SMOOT. Why did the United States Government, through ts Food Administration, ask certain men in New York to scour the world for sugar and import into the United States to break the Cuban price, if that were not true?

Mr. ATKINS. They did not understand the situation.

Senator SMOOT. Oh, no.

Mr. ATKINS. Will you wait a moment?

Senator SMOOT. Yes.

Mr. ATKINS. I was called to Washington two years ago, I think was, when I came back from Cuba, for an interview with Palm He wanted the various sugar people to make suggestions about h the price of sugar should be checked. He said it was going up to very high point. I said, "Mr. Palmer, I have just come from Cub I can assure you that there is no real scarcity of sugar." I said th there was sugar enough in Cuba to run the United States through i the next beet crop in October, and this was early in June. He sa "How do you know that?" "I have seen the sugar in Cuba. know that there is a large stock of sugar in the interior of Cuba th never has been reported." They only reported the stocks in t ports, and "I know that there is sugar enough there to supply t country up until the 1st of October, together with what other sug is to arrive."

But he did not think I was right. I knew I was right.

Senator SMOOT. I know you were right, too; and Mr. Spreckels a myself testified before a Senate committee that there was ample sug to take care of the situation, but that was not what the Governme was after. They were trying to break the price of sugar, and on last week there was a bill passed the Senate granting to one of the importers of sugar a claim of $1,000,000, and the claim was prese by our own department because of the fact that they had request them to bring this sugar in, and it did not come here—the last t shipments—until the price had broken in Cuba. They paid 11 cen for it, and we just the other day granted the claim of over $1,000,0 to that one importer upon one importation of 9,000 tons of sugar.

Mr. ATKINS. Because the Government had requested it.

Senator SMOOT. Certainly. That is why I said the Governme had to go to work and get 800,000 tons of sugar from somewhere e besides Cuba to break the price that the Cuban planter was holdi his sugar at.

Mr. ATKINS. There was no need of that on the part of the Unit States Government. They took that responsibility entirely up themselves. They disregarded the advice of the sugar people w knew about the situation.

Senator SMOOT. But it was the only way that the Cuban price w broken; that is what broke the price and nothing else.

Mr. ATKINS. It would have broken. I told Palmer at that tim if he would call the newspaper reporters in—they were waiting o side of the door—and tell them that the consensus of the opinion that meeting was that there was plenty of sugar, if carefully handl to carry the country through and to prevent a further advance, th it would check all of these high prices. If he had taken my adv they would have had none of those high prices.

Senator SMOOT. They did take your advice as far as the Sena was concerned, and we held that investigation of the whole thin and the Sugar Equalization Board was there. The Sugar Equaliz tion Board took exactly the opposite position; and I think that M Spreckels and I were the only two witnesses who said there w ample sugar in Cuba and in the United States to take care of t situation. But that does not affect the price. The price of sugar

Cuba did not decline until importations began, and the result of those importations has been that there has been too much sugar in the market, together with the extreme amount of sugar that Cuba produced—3,900,000 tons—and that is what is the trouble with the sugar market to-day, and you as a refiner must know it.

Mr. Atkins. Of course, I know it—that the trouble to-day is overproduction of sugar, and I also know that for overproduction Mr. Hoover is directly responsible. He, in his desire to help win the war and to do everything in his power—and he did it well, too; I appreciate his ability—but he is responsible for this overproduction of sugar.

Senator Smoot. Your position is, of course, that the beet sugar has got to stand this?

Mr. Atkins. No.

Senator Smoot. Cuba brought it on..

Mr. Atkins. Why do you make such an assertion as that?

Senator Smoot. Because of the very fact that you know very well, as you are a refiner, that the cost of sugar here in America is more than a cent a pound above what the cost of sugar in Cuba is. You know that and every other refiner knows it, and you yourself testified as to how interested you were and about the charity that had been extended to the laboring people of Cuba. It seems to me that if you wanted to extend charity to the Cuban laborer you people ought to pay them more than 65 cents a day in store pay.

Mr. Atkins. How is that? Why do you make such an assertion as that? Here I am, an American citizen from Cuba. There are many others there also in the same position. We have done everything in our power to take care of our laboring population. I have paid those men a dollar a day all through the summer time when I did not need them at all, in order that they might provide for their families, and I resent the charge that I have only paid 65 cents a day. It is not true.

Senator Smoot. I do not know what you have been doing, but I will put in this testimony, which no one on earth can deny, that the price that has been paid this last winter has been 65 cents a day, payable in merchandise at retail.

Mr. Atkins. I do not know where you got that information.

Senator Smoot. I got it from better authority than you are, and it is from the officials of the Government of the United States; that is where I got it; and I am not stating anything here that I do not know.

What is the duty on sugar in England?

Mr. Atkins. I can not tell you.

Senator Smoot. It is $4\frac{3}{4}$ cents a pound, is it not?

Mr. Atkins. I do not know, sir. I have not followed that, because we have no English business now.

Senator Smoot. Would it not be a good thing now for the American refiners to get some English business?

Mr. Atkins. Undoubtedly; it would be a good thing for the American refiners to get some English business all the time.

Senator Smoot. They are going to get it, too?

Mr. Atkins. I do not know.

Senator Smoot. I am going to help them.

Mr. Atkins. I think it very doubtful if they get it.

Senator Smoot. I do not think so.

Mr. ATKINS. We are trying every day. We have one of the best houses in Great Britain acting as our agents. We are very close to them.

Senator SMOOT. I think you will get it, all right.

Mr. ATKINS. We are trying to get that business.

Senator SMOOT. You will, if I can help you.

Mr. ATKINS. We want to get it, but the trouble is you have not only to arrange for the export of this sugar. You have got to arrange for a buyer. "You can lead a horse to water but you can not make him drink" until he gets thirsty.

Senator SMOOT. I guess he is thirsty now, and I want to help you. I think that is what we will do. I think you will get the export business.

Mr. ATKINS. Now, tell me how you are going to get it.

Senator SMOOT. I do not know that it would do any good to go into details, but if you will come to my office I will tell you.

Senator WALSH. The Senator wants to keep you out of this country and send you over to Great Britain.

Senator SMOOT. No; I want, Senator, to do something to relieve the situation that was brought onto this country by the Cuban sugar manufacturers.

Senator WALSH. I think you are both trying to make the consumer pay the bill.

Senator SMOOT. That is all, Mr. Atkins, that I wanted to say.

STATEMENT OF HENRY A. RUBINO, REPRESENTING MIRANDA SUGAR CO., NEW YORK CITY.

The CHAIRMAN. You represent the Miranda Sugar Co., of 79 Wall Street, New York City.

Mr. RUBINO. Yes, sir.

The CHAIRMAN. Where do you reside?

Mr. RUBINO. New York City.

The CHAIRMAN. Where is the Miranda Sugar Co. located?

Mr. RUBINO. In the Province of Oriente, Cuba.

The CHAIRMAN. You are an importer, then?

Mr. RUBINO. Yes, sir.

The CHAIRMAN. Go ahead and state your views to the committee.

Mr. RUBINO. I represent the American interests who are engaged in the production of raw sugar in Cuba, and we desire to present to you the facts and the proofs with reference to the magnitude of the American interests in Cuba. Judging from the debates and the testimony that has been introduced before your committee and the Ways and Means Committee at the time the Fordney bill first made its appearance as an emergency measure, it was evidently the desire of the Congress to extend to the domestic sugar industry—and by the "domestic sugar industry" I mean not only the continental industry, but the industry in sugar in the insular possessions—relief from the conditions that existed a year ago, and it was believed by the Congress that that relief could best be extended by increasing the duty on sugar and measuring the difference by what the Congress deemed to be the difference in cost of production between the domestic industry and Cuban sugars.

So that primarily it affected Cuban sugars and Cuban sugars alone.

In order that I may logically present my argument to you, I trust you will bear with me for a few minutes if I state briefly some facts which are—some of which are necessarily known to you.

The United States consumes annually four and one-half million tons, approximately, of refined sugar, and that four and one-half million tons of refined sugar comes to us in this way: The beet industry of the United States, which produces a refined sugar when it is through with the process, makes approximately 800,000 tons. Louisiana, Texas——

Senator WATSON (interposing). Four and one-half million tons refined is how much raw sugar?

Mr. RUBINO. That is very difficult to answer, sir, because you get a different quantity out of beets than you do out of cane sugar.

Senator WATSON. That is what I supposed; but I was just asking for the information you can best give us.

Mr. RUBINO. As near as I can give it to you, a ton of beets produces 250 pounds of sugar.

Senator SMOOT. No; not that much.

Mr. RUBINO. That is the testimony given before your committee, Senator Smoot.

Senator WATSON. Whether it is beet or cane?

Mr. RUBINO. No; it differs with reference to cane—different in Louisiana cane from Hawaiian cane.

Senator WATSON. Then, when you say that a ton of raw sugar produces 250 pounds refined, you had reference to beet.

Senator SMOOT. You could get as much as 250 pounds out of a ton of beets of the very highest saccharine content. But the average is 233, so our department says.

Senator WATSON. That has been my understanding—235 pounds.

Mr. RUBINO. I gave the highest figure.

Senator SMOOT. I know you did.

Mr. RUBINO. Approximately 200,000 tons come into the markets of the United States from Louisiana and Texas. That sugar is raw cane sugar, but is refined or clarified in most of the plantations or factories in Louisiana, so it is a higher grade of sugar.

So that, generally speaking, we get in the United States a million tons of sugar, and that sugar is marketed in the West and in the far West.

From Hawaii we receive approximately 500,000 tons of cane sugar, and that cane sugar is practically all marketed in the far West; some of it in the mountain States of the West, and is mostly refined in a refinery controlled by the Hawaiian plantations in California—the California-Hawaiian Sugar Refining Co.

Porto Rico produces about 350,000 tons of raw sugar.

So that with a small quantity that comes in from the Philippine Islands, of raw sugar, there is received into the United States and produced in the United States approximately 2,000,000 tons.

The eastern section of the United States consumes about two and one-half million tons, and that sugar is obtained from Cuba in the shape of raw sugar and to the extent of about 350,000 tons from Porto Rico, which is also, like Cuban sugar, imported in a raw state and refined along the Atlantic coast by refiners who refine the bulk

of the sugar, and it is sold mostly in the Atlantic States, except when there is a condition of freight rates which permit it to be sold farther West.

What I want to impress upon you, if I may, is this: If the theory of this increase of the tariff by the Fordney bill was to ease the American industry from loss, it has signally failed in that accomplishment.

The Fordney bill has now been on the books for about seven months, and ever since its enactment down to the present time the benefit of that increase has not increased the selling price of domestic sugar. It has not made it one farthing dearer to the American public; it has not put one dollar into the hands of the domestic industry. All that it has accomplished, all that it can accomplish, is to practically ruin the American investment in Cuba, an investment that I will presently show you the magnitude of and will show to you has not been anything but injured by this measure.

Now we plead that if you have not benefited the domestic industry, if you have not helped it—and that was its conceived and avowed purpose—that the only thing it has accomplished is to injure the vastly greater American industry, that surely ought to be a compelling plea.

Senator McLEAN. That is your assumption. How do you know what the price of American sugar would have been if it had not been for the increase in the tariff?

Mr. RUBINO. What it would have been?

Senator McLEAN. Might it have been much lower than it is now?

Mr. RUBINO. It has been lower.

Senator McLEAN. How do you know? You have had your protection on it and it has gone lower. Now it is mere speculation on your part as to what the price would have been if there had not been protection.

Mr. RUBINO. I can not say that, Senator, for this reason, that we know what the market has been; we know what the sugar has brought; we know that despite the tariff it has not even maintained itself.

Senator McLEAN. You do not know what the price would have been if you had not had the tariff.

Mr. RUBINO. Suppose that be true——

Senator SMOOT (interposing). There would not have been any sugar industry in the United States if that had been true.

Mr. RUBINO. No, Senator; and you know that, and you know——

Senator SMOOT (interposing). I do know this, that the tariff has at least kept the industry alive, and that is all. I do not know how long it can live, but without it they could not live a month.

Mr. RUBINO. But is not that just as much speculation, Senator, as the theory that has just been advanced by the Senator, that it might have gone lower?

Senator SMOOT. No. If that is the case, if your theory is correct, what we want to do is to take $1.60 a hundred on Cuban sugar refined, out of the Treasury of the United States and give it to Cuba.

Mr. RUBINO. I do not think so, sir.

Senator SMOOT. Then how could you possibly make the statement that you did, that it did not do the sugar-producing industry of America any good whatever?

Mr. RUBINO. Because that is the fact.

Senator SMOOT. Well, I say it is not the fact.

Mr. RUBINO. Then we may differ upon the proposition, of course. When we come to the two and one-half million tons of sugar that re imported from Cuba into the United States, I am going on the ssumption that when you speak of protecting the American industry n sugar you are not going to discriminate between the American nterests in Utah or Hawaii or any other beet-producing State gainst the American investment in Cuba, and I want to show you he extent of that investment.

There will be filed with you a memorandum, where we have ttempted, with the greatest care and with all the data that is available and at our command to make accurate, to show you the extent f that American investment to-day, represented by stocks and securities, widely held and distributed in the United States, amounting to ver one billion dollars invested in the sugar industry in Cuba according to actual figures.

Let us compare the amount of that investment with the total nvestment of domestic sugar, whether it be continental sugar in the United States or sugar embraced in the insular possessions.

You have invested in the sugar industry, according to the latest vailable data—and we have given the benefit of every doubt—$175,000,000; the highest that the Tariff Commission shows or the Trade Commission shows is $150,000,000. There is invested in the Hawaiian industry $208,000,000; there is invested in Louisiana and Texas $39,000,000; there is invested in Porto Rico $71,000,000. With the investment in the Philippine Islands, the total amount nvested in the industry in the United States and in its insular possessions, from which it draws 2,000,000 tons, is $545,000,000.

So that the American industry in Cuba has twice as much at stake s all the other industries.

Senator SMOOT. Of course the Cuban industry takes in the value of the lands that these people hold.

Mr. RUBINO. I beg your pardon, Senator; that is an assumption.

Senator SMOOT. Well, it is not any assumption; it is the report.

Mr. RUBINO. You may have figures that are not available to us, but at least we can say this, that in case of many of the beet-sugar farmers the land that is not held directly by the beet farmers is held by the beet factories who actually have it under control by a lease or otherwise; and it also is a fact——

Senator SMOOT (interposing). There is not one-fourth of 1 per cent so controlled.

Mr. RUBINO. Suppose that be true——

Senator SMOOT. There is not one-fourth of 1 per cent. I do not think there is any except for experimental purposes and in some cases for the raising of beet seed.

Mr. RUBINO. I can not tell you the percentage, Senator, but I can tell you this, that I know from personal knowledge and experience that one beet-sugar factory controls over 50 per cent of its land, how many more I do not know. But, then, we might get into a controversy on that proposition.

I do know that what is actually invested in the sugar business in America and its insular possessions does not exceed, at its highest, $545,000,000, and we do know to a definite certainty that American

capital widely distributed here to the extent of $1,000,000,000 is in- vested in Cuba.

The American industry does not turn into the Treasury of th United States by way of a duty a single penny, but the Cuban sugar controlled by American capital, not only pays its cent a pound, bu is now asked to pay and has been paying 1.60 cents a pound. Wh injure the American industry? If there is any virtue in it it might b that the sugar is grown here? I have heard it said—and the autho of this bill is reputed to have said; I hope he did not say it—that Americans are foolish enough to invest their money in a foreig country that is their lookout. I can not credit that; I can not cred that the American investor who invested his money in Cuba becaus he was requested by this Government under a different political com plexion to do so should suffer or pay the penalty for that reason.

Senator SMOOT. The American investor invested his money i Cuba before there was ever a world war.

Mr. RUBINO. You are quite mistaken about that. He investe some of it.

Senator SMOOT (interposing). I did not say all of it; I said pa of it.

Mr. RUBINO. But the great bulk of it was put down there, and was put down there for this reason—I am going to be very brief i reading this to you, if you will permit me, but it is reputed to b Secretary Hoover's statement to the President in discussing the suga production of the Western Hemisphere. He is quoted as saying:

> The above figures show the tremendous increase in the production which result during the period of Government control in Cuba, against which increase the slig decreases in the other sources of supply were negligible. A much higher price th that which prevailed in 1918-19 might have conceivably increased production the United States beet industry, Porto Rico and Hawaii, to the extent of a fe hundred thousand tons. But the wiser policy was adopted of assuming a price le which would encourage production in the only source of supply from which large i creases could be immediately expected in response to the relatively small pri increases, which is Cuba.

Senator SMOOT. That was not so very much of an investmen That was land you already had, and you planted more lands to g more cane.

Mr. RUBINO. No, we did not.

Senator SMOOT. I know you did increase; nobody denies tha But take the amount of sugar that you produced in 1917, when w went into the war, and then 1919, and that will tell you how mu you increased.

Mr. RUBINO. Let me tell you that increase——

Senator SMOOT (interposing). I know it.

Mr. RUBINO. If you know it, then my statement will simply be repetition of something that you know. But for the benefit of tho who do not, it is 15 per cent.

Senator SMOOT. That is perfectly satisfactory to me, sir.

Mr. RUBINO. So it is now, sir; but the beet industry increased 3 per cent. The increase is not in the Cuban cane industry, as yo would have it appear. I do not say that offensively. The Cuba industry is suffering by reason of this tremendous increase. It mad this increase because it was requested by this Government to do s

ld I wonder why Mr. Atkins, is answer to your question, when ou spoke of the tremendous increase in price of Cuban sugar 1920, did not recall to you that it was the subject of such crimonious debate on the floor of the Senate, when the McNary ill was under discussion, that the Cubans offered their entire op to this country for—not 24 cents nor 20 cents nor 15 cents or 0 cents, but 6½ cents, and the offer was not accepted—and why id the Cubans increase their price? Because the Attorney General f the United States tacitly agreed that the price of Louisiana sugar ould be 18 cents—at least he agreed not to prosecute—and if ouisiana could get 18 cents for its sugar, would you, Senator, expect hat the beet industry would take less, or that the Cuban industry ould take less? Cuba had offered you her crop at 6½ cents. Why id not the Government accept that offer? I am not here to answer hat. I am answering your argument.

Senator SMOOT. So far as that is concerned, I ask why they did ot take it. If I had had my way they would have done so. But ou know why they did not take it, and there is no need of discussing hat.

Mr. RUBINO. I understand the reason we did not take it was ecause Prof. Taussig had the ear of the Government at the time and hought that economically it was a blunder. Perhaps he was mistaken. There was no reason why Cuba should not get its price if he beet-sugar people got their price. Did the beet people fare oorly under that? They got the same price.

Senator SMOOT. The beet people were restricted in price, and when ouisiana was allowed to sell at 18 cents they were compelled to sell at 10.50. We were compelled to pay $12 for beets, and we have got ome of that sugar on hand now not disposed of.

Mr. RUBINO. So have the Cubans. The boat the beet-sugar people re riding in is no different from the boat that the Cuban sugar eople are riding in. They are suffering just as much and just as adly. That is why I urged upon you for consideration—though t seems not to have met with ready acceptation—that presumptively n the face of it the domestic producer has not benefited at all times y this increased tariff. And in answer to the Senator's question, he price of sugar is even below the price that prevailed before the luty was put on.

Senator SMOOT. You know the reason why, of course?

Mr. RUBINO. The reason, sir——

Senator SMOOT (interposing). It has nothing to do with the duty. If the duty had not been put on it would have been just that much less.

Mr. RUBINO. The reason is the ordinary law of supply and demand; and that will occur no matter what the duty is. But in the meantime, I am trying to press home to you that a billion dollars of American ndustry is entitled at least to some measure of protection at the hands of Congress.

Senator SMOOT. Yes. But if it is entitled to some measure of protection by Congress, then it must pay its labor somewhere near what the American people pay their labor, and that it is not doing.

Mr. RUBINO. Senator, what labor does the domestic sugar indus-

try pay? Does the sugar industry employ American labor for whom we all recognize the American standard of living, or does it employ Russian labor and Japanese labor and Mexican peons? That is the testimony given before your committee that that is the kind of labor employed, and how much difference does it pay? You have heard somebody say that in Cuba perhaps a Haitian or Dominican Negro gets 70 cents a day and takes it out in store trade.

Senator SMOOT. Not 70, but 65.

Mr. RUBINO. I came from Cuba Friday. I manage three larg mills there. Our laborers are not paid any such amount, and I know of none that do.

Senator SMOOT. In the mill—the men that raise the cane, the labo that is in the field the same as we have to have the labor in our bee fields? There is not any labor that we can get at less than $3 a day

Mr. RUBINO. The reason for that is obvious, because the farmer where he happens to be an American farmer, and in the beet indus try he is a scarce commodity, finds he can get a more profitable cro if he raises corn than beets.

Senator SMOOT. That is not the question at all.

Mr. RUBINO. No; but it is a vital question. Your scientif body, the Tariff Commission, has stated that it is only in ex ceptional localities that beets can be raised economically; that all th conditions must be just right for its production. I can onl take the reports as I find them given by a body of government experts. If they are wrong, I can not be right. I take from their reports, and apparently they have the willing ear of th committee and of the House Ways and Means Committee. The are statements in the public press from time to time that you g great aid and assistance from the Tariff Commission. So I assum that that body, with no bias and with no axes to grind, is giving acc rate information, and when I make these statements to you they a made on the strength and authority of those experts.

Senator SMOOT. Let me tell you, I care nothing what the Tar Commission says. If there was a duty sufficient to protect the lab of the United States against the labor in Cuba, and the Americ people felt that that would remain on the statute books for 20 yea there is ample—yes, more than ample—ground in the United Stat to raise all of the sugar that the United States would consume a two or three times more.

Mr. RUBINO. Senator, I have heard the statement made, and have heard it said by so well informed a witness as Mr. Petrikin I think you know him?

Senator SMOOT. Very well.

Mr. RUBINO. Mr. Petrikin represents beet-sugar companies. if am correctly informed, producing about 30 per cent of the crop the country. Chairman Fordney asked Mr. Petrikin in January this year, "Mr. Petrikin, is it a fact that the United States can produ all the beet sugar that it needs to supply the sugar consumption the country?" And Mr. Petrikin's answer was this: "I wish it w so, but it is not humanly possible." He should know.

Let me give you something further——

Senator SMOOT (interposing). I can take my own State of Ut We could produce four times the amount of beet sugar—yes, t

times the amount of beet sugar that we are doing to-day if conditions were such that would justify it.

Mr. RUBINO. Exactly. What are those conditions?

Senator SMOOT. By equalizing the cost of producing the sugar in America and in Cuba; that is all.

Mr. RUBINO. Senator, may I ask you this: What makes you believe that there is a disparity in the cost between Cuba and this country?

Senator SMOOT. To-day?

Mr. RUBINO. Yes; to-day or any time?

Senator SMOOT. The amount that Cuba can produce sugar for and deliver it in New York and have it refined. The amount it costs to-day would not equal the amount that we pay for the beet itself—that is, the saccharine in the beet.

Mr. RUBINO. Let us see a minute. You know, Senator, because you are probably the best informed on sugar of any man in Congress—with all due respect to the other gentlemen—you know that the State of California can produce beet sugar much cheaper than the State of Utah, and you know that the State of Utah can produce sugar much cheaper than the State of Michigan; you know that, I am sure?

Senator SMOOT. We can not do it much cheaper.

Mr. RUBINO. As much as 2 cents a pound.

Senator SMOOT. That is not so.

Mr. RUBINO. If in the last three years of the sugar business, with the highest prices known and paid for refined sugar, why is it that the American beet industry has steadily declined in production, if it was such an easily cultivated process, and why is it that Cuba, as you just pointed out, can grow sugar in such great abundance, and if it can grow it ever so much cheaper why should the American public be made to pay the increased price for the beet sugar in order that that industry may prosper at the expense of the American industry in Cuba?

Senator SMOOT. That is bringing up the whole question of the tariff.

Mr. RUBINO. Of course, that is bringing up the whole question of the tariff.

Senator SMOOT. There is no need of discussing that with you. The committee will decide whether they want American industry or whether they want a foreign industry.

Mr. RUBINO. I take it the committee will do justice between American industries, whether it happens to operate in the United States, in Utah, Colorado, or California, or whether it operates in Cuba, 90 miles from the east coast of the United States.

Senator SMOOT. There is quite a different class of people that operate it, and quite a different pay roll that is paid, and they are just as good customers as the people of Cuba.

Mr. RUBINO. I do not say that we are better customers, but when it comes to the class of laborers I can point out to you that such experts as Mr. Petrikin and Mr. Edgar and other beet-sugar people say that they are dependent upon Mexican peons and to some extent upon Japanese. And when it comes to the Japanese, and the manu-

facture of Hawaiian sugar, which is also being protected, I read your own statement made in this committee room, where you pointed out that Japanese clerks in Hawaii were getting $18 a month in wages; and that is the industry that you were seeking to protect by this extra tariff.

Senator SMOOT. No; it is not. I will say to you that that happened under forced contract, forced upon the manufacturers and growers in Hawaii at a time when they were compelled to enter into a contract that was made, and that happened because the price of sugar rose so rapidly in the world, and as it rose so did the contract price raise. But they never would think of a contract like that in ordinary times. They could not live under it and you know they could not live under it.

Mr. RUBINO. Certainly, I agree with you. No more could they make such a contract than the beet people can make a contract for their beets, and the farmers, in whose interests so much clamor is raised, in their own interest had to come to Congress and ask an investigation at the hands of Congress to secure fair prices from the beet sugar and mill owners. You know that just as well as I do. You know the report of the commission.

Senator SMOOT. I think there is no farmer but who is well taken care of and paid $12 a ton for beets, and that meant at least $10 sugar, and I do not think that sugar sold for much more than 5 cents.

Mr. RUBINO. May I ask you, if it not an impertinent question, if the desire is to protect the beet farmers of the United States, why is the duty on beets 5 cents ad valorem against a 90 per cent duty on the price of cane sugar? Is it because the Michigan beet-mill owner might import plenty of beets from Canada?

Senator SMOOT. You know what he imports from Canada?

Mr. RUBINO. That is increasing, sir.

Senator SMOOT. It does not amount to much.

Mr. RUBINO. It is increasing. Senator McLean, you wish to ask a question?

Senator McLEAN. No; I think not.

Senator SMOOT. I will say that Mr. Petrikin will testify as to what he knows about sugar and about importations, and about the difference in cost, to-morrow, I suppose.

Senator WATSON. I want to ask you what is the difference in the cost of production of sugar in California, Utah, and Michigan? You made a statement awhile ago that according to the report of the Tariff Commission the most profitable State to grow beets in is California, by reason of climatic conditions; and they have pointed out that the difference in growing beets under well regulated, economical conditions is as high as 2 cents a pound as against Michigan and States that are in the Middle West zone.

Senator SMOOT. Senator, I want to explain what the commission did say. The commission took the mill that could produce sugar the cheapest in California and took the mill that costs the most to produce beet sugar in Michigan, and that is the difference; that is not the ordinary run of mill.

Mr. RUBINO. Senator Smoot, you may have read another report. That is not the report I had reference to. I had reference to the average produced in those two sections.

Senator SMOOT. I say that any commission that would make the atement that with $6 beets there was $2 a ton difference between alifornia on the average and Michigan on the average or Utah on ie average has never made that investigation.

Mr. RUBINO. That, sir, must be an indictment that the Tariff ommission must answer. I simply replied to Senator Watson's uestion.

RIEF OF HENRY A. RUBINO, REPRESENTING AMERICAN SUGAR INTERESTS IN CUBA.

This country now consumes annually about 4,500,000 long tons of raw sugar for fining purposes.

Of this amount there is normally produced in this country about 850,000 tons of et sugar. This sugar is produced to a great extent in factories located in the Western ates and to some extent in the Middle West. The raw beets are turned into refined gar in the same factories.

In addition, there is produced mostly in Louisiana normally about 150,000 tons of ne sugar. This is manufactured in so-called raw-sugar mills and many of them are uipped to produce refined sugar.

In the United States, therefore, about 1,000,000 tons of sugar is produced.

Our insular possessions—Porto Rico, the Hawaiian and the Philippine Islands—rmally produce, respectively, 400,000, 500,000, and 200,000 tons of cane sugar ought to the United States and refined here. Practically all of this sugar, with e exception of the Hawaiian and Philippine sugars, is refined in the Atlantic States.

The total sugar produced in our country and our insular possessions aggregates ,100,000 tons.

About 2,500,000 tons are normally secured from Cuba, concededly the largest raw-gar producing country in the world. None of the sugar produced in the United tates or in its insular possessions pays any duty.

The raw sugars from Cuba manufactured in its raw-sugar mills is brought to the nited States and practically all refined in the Atlantic States.

This sugar, by reason of a reciprocity treaty between the United States and Cuba, ays 20 per cent less duty than raw sugar coming to the United States from any other ountry.

For some years past and up to the time of the passage this year of the Fordney mergency tariff, the duty on Cuban raw sugar amounted to about 1 cent per pound. he Fordney emergency tariff increased the duty, making it 2 cents a pound, and with e differential of 20 per cent in favor of Cuban sugars, brought the duty of Cuban w sugar to 1.6 cents a pound, or six-tenths of a cent a pound higher than before.

The proposed tariff bill now under consideration proposes to continue the rate of uty enacted by the Fordney emergency tariff bill.

It is necessary in order to intelligently discuss this increase with your committee hat it shall have some idea of how the sugar produced in the United States or which aches here is sold and distributed.

BEET SUGAR.

This is generally sold in the Middle West and Western States and the manufacturing ants obtain their supply of raw beets from the territories where the plants are located d sell the refined sugar in that territory.

As the expense of cultivating and harvesting the beet seed and beets (all the good et seed has to be imported from Europe) is high, the geographical situation must e considered, as the transportation expense of the raw material and the finished roduct prevent competition too far east. Beet sugar comes in competition with cane gar only where the freight rates are not prohibitive and for that reason is rarely und east of Buffalo and Pittsburgh.

LOUISIANA CANE SUGARS.

As the climatic conditions do not favor growing cheap cane sugar in Louisiana and nsidering its geographical location, the sale of the comparatively small amount f Louisiana cane sugar is limited to the South and Southwestern States adjacent to

Louisiana. Its relatively small production can not be materially increased by re son of limited land available.

HAWAIIAN SUGARS.

Practically the entire Hawaiian raw-sugar industry is in the hands of a few inter who are also interested in what is known as the California and Hawaiian Sugar Re ing Co., located near San Francisco, Calif., and the refined sugar is mostly sold in t extreme Western States, but competes with beet sugar to the extent that inla freight rates permit it. It has apparently reached the limit of production by reas of limited land available.

PHILIPPINE SUGARS.

The relatively small quantity of Philippine sugars (about all it can produce) m to the Pacific coast, but as permitted by freight rates and the use of the Panama Can a comparatively small quantity reaches the Atlantic States refiners.

PORTO RICAN SUGARS.

This crop practically goes to the Atlantic coast refiners. It also has apparent reached the limit of production by reason of limited land available.

CUBAN SUGARS.

These sugars practically go to the Atlantic coast refiners.

As a practical proposition, therefore, our beet, Louisiana, Hawaiian, and Phil pine sugars, due to their geographical situation, leave the large eastern terri (where over one-half of the refined sugar of the United States is consumed) to t raw sugars furnished by Cuba and Porto Rico.

In the past the hearings before the Congress relating to the question of sugar affected by the tariff legislation enacted in prior years proved and it has been ge erally considered by the Congress that our own sugar production and that of o insular possessions were sufficiently protected by the duty of 1 cent per pound Cuban sugars and 1.25 cents per pound on the full-duty sugars.

The Federal Trade Commission in its "Report on the Beet Sugar Industry in t United States" (Washington, Government Printing Office, 1920) at page 16 says

"Even after the Cuban reciprocity treaty when the duty was reduced to abo $1.35 per 100 pounds the advantage (to the beet-sugar industry) was still very grea

Cuban sugars are practically sold on a parity or price basis of the free-duty sug of our insular possessions, especially Porto Rico.

The 20 per cent differential in favor of Cuba simply enabled Cuba to compete to certain extent with the full duty-paying sugars from other countries and even this a parent advantage disappeared when the full-duty sugars sold in competition w Cuban sugars and Cuban sugars in turn competed with the free-duty sugars of insular possessions.

It is only at such times when raw sugar sells at a very low price that Cuba is enab to sell its sugar in competition with the full-duty sugars, and since the enactmen the emergency tariff the full-duty sugars have successfully competed with Cub sugars.

Since the enactment of the Fordney emergency tariff, Cuban, as well as full-du sugars, have sold on a price basis equivalent to free-duty sugars and at no time has t increased tariff of six-tenths of a cent been borne by the American consumer. times refiners have purchased full-duty sugars and Cuban sugars at a slightly hig price and only where these sugars were reexported to Europe and the benefit of t drawback obtained.) The increased tariff, therefore, has in all cases been borne b the Cuban producer.

It is reasonably certain that any increased tariff will continue to be borne by t Cuban producer. That Cuba is not benefited by the differential in her favor is w known. The report of the United States Tariff Commission furnished to the Congr pursuant to section 704 of Title VII of the act of September 8, 1916, on "Reciproci and commercial treaties," clearly shows that the American price throughout the lar

part of each year was determined upon the basis of the duty on Cuban sugar and not on the full-duty sugars, and the American consumer gained all or most of the remitted duty through a corresponding reduction in the price of sugar.

The American price throughout prior years was consequently on the basis of the Cuban duty and they inured wholly to the benefit of the American consumer and up to the outbreak of the war the American consumer was gaining the whole of the benefit from preference to Cuban sugar.

The Tariff Commission reached certain general conclusions on this subject, one of which reads as follows:

"The imports into the United States from Cuba appear to reflect the influence of reciprocity to a much less significant degree than do the exports of the United States to Cuba."

Assuming therefore that any increase in the tariff on sugar is not borne by the American consumer, but by the Cuban sugar producer, the present proposed increase is opposed on the ground that it will do serious injury to the large amount of American capital invested in the sugar industry in Cuba. The proposed tariff, no matter what its avowed purpose may be, is either a tariff for revenue or a tariff to protect American industries. Whatever may be its purpose the arguments to be hereinafter advanced apply with equal force.

Assuming solely for the purpose of argument that our own sugar production and that of our insular possessions need protection, it is urged on your committee that the Cuban sugar industry, the largest in the world, is for all practical purposes an American industry and institution.

Due to changes in ownership that have been going on steadily for a number of years, and especially within the last few years, the American investor attracted by the favorable geographical and climatic conditions of Cuba, the seeming protection afforded by the various treaties between the United States and Cuba, especially the treaty of 1903, deemed himself safe in making large investments in Cuban sugar mills, lands, allied and associated industries and businesses, and the attempt has been made in this brief and its supporting exhibits to present to your committee the extent of such investments.

A careful investigation has been made and it is the belief that the data secured is reasonably accurate. It is supported in many instances by the latest balance sheets of the corporations whose data is quoted. Recourse has been had to approved and reliable financial agencies, sugar-trade agencies, those familiar with the sugar business, and officers of the corporations whose names are set forth.

Exhibits have been prepared and will be submitted with this brief which it is believed will startle and amaze your committee as to the vast extent of American capital invested in the sugar industry in Cuba. From the best sources available it appears that the securities outstanding, such as bonds, stock, etc., are widely held and distributed among investors of the United States.

Before quoting the total of these figures it may be well to point out that it appears that the aggregate amount of American capital invested in the Cuban sugar industry is far greater than the combined amount of American investments in the United States beet-sugar properties, the Louisiana sugar industry, and the sugar industries of our entire insular possessions.

It is obvious that if our sugar industries need protection, the Cuban industry, practically owned by Americans and in which the American investing public is vitally interested and involving more than the combined investment of this country's sugar industry and that of its insular possessions, is entitled to the same measure of protection.

Certainly if a 1 cent per pound duty was deemed sufficient to protect our sugar industries, now that it appears that our industry in Cuba is vastly greater, the protection to our own investment should not be increased at the expense of our industry in Cuba.

The proposed increase of six-tenths of a cent per pound, while it may afford a greater measure of protection to our own sugar industry, would ruin our industry in Cuba and utterly destroy our American investment there.

In tabulating the schedules accompanying this brief, the endeavor has been made to show.

1. The investments of companies in Cuba represented by corporations organized in the United States and including companies or sugar estates solely owned by Americans.

2. Sugar estates financed by American banking and other American interests and for all practical purposes controlled and owned by them.
3. American-owned interests located in Cuba dependent entirely or in great part upon its sugar industry.
4. American manufacturers and business houses dependent in whole or in great part upon their business with the Cuban sugar industry.
5. The investment in the beet-sugar industry of the United States.
6. The investment in the cane-sugar industry of Louisiana and Texas.
7. Investment in the cane-sugar industry of Porto Rico.
8. Investment in the cane-sugar industry of the Philippine Islands.
9. Investment in the cane-sugar industry of the Hawaiian Islands.

Schedules 5 to 9, inclusive, have been taken from such publications as "Moody's" and other well-known agencies, and where no other data was available the rating given by the commercial agencies has been taken into consideration.

Cuba's production of sugar is the largest in the world.

As the present crop is not yet completed, the crop ending in 1920 is taken as a basis for production. That crop in round numbers amounted to 3,725,000 tons and again using approximate figures the production in the mills owned and controlled by American capital amounted to 2,500,000 tons or about 67 per cent. It appears, therefore, that with a production of more than two-thirds owned by American capital in Cuba, this production exceeds the entire production of the beet sugar and cane sugar industry of the United States and its insular possessions.

Or to state it more definitely, the amount of Cuban cane sugar annually consumed in the United States is furnished entirely by American capital.

When we come to the amount of money involved, the figures are even more startling. Over $1,000,000,000 appears to be invested in Cuban sugar mills and its allied business dependent upon sugar. The combined investment of the beet-sugar industry of the United States, its cane sugar and its insular possessions, aggregates $545,000,000.

A brief summary of these investments is as follows:

CUBA.

Sugar mills and estates owned by Americans	$621, 219, 766
Sugar estates controlled by Americans by reason of their being financed by Americans	125, 000, 000
Investments in Cuba owned by Americans dependent entirely upon the sugar business	156, 250, 000
Amounts due Americans for machinery, merchandise, and supplies and secured in part by equipment trusts, etc	128, 600, 000
Total	1,031, 069, 766
Beet-sugar industry in the United States	172, 610, 022
Cane-sugar industry in the United States	32, 828, 407
Cane-sugar industry in Porto Rico	59, 708, 527
Cane-sugar industry in the Hawaiian Islands	208, 911, 520
Cane-sugar industry in the Philippine Islands	71, 200, 000
Total	545, 258, 476

These figures speak for themselves. The proposed permanent increase is 60 per cent higher than the present tariff, a very considerable increase (this is after the differential of 20 per cent is taken into consideration). In dollars and cents and as a revenue measure it means $35,000,000 more to the Treasury of the United States.

We will presently show the ruinous result to the American investment in Cuba, an industry of over $1,000,000,000 is at stake and has its existence threatened by a tariff which will yield $35,000,000. But it is by no means certain that it will mean $35,000,000 to the United States and for these reasons:

If the basis of our belief that this increased tariff will ruin the American investment in Cuba is correct, it will also ruin the Cuban investment in sugar and this will certainly result in a vast reduction of the sugar production in Cuba.

The imports of sugar into the United States from Cuba will be correspondingly less and the United States will not be able to fill the national sugar bowl, because if Cuba, with the differential in her favor, can not produce sugar, then the full duty sugars can not be produced, and this country and our insular possessions do not furnish half the amount of sugar needed in the United States. (The full duty sugars are not sufficient in volume to make up the difference.)

The imports into the United States are, of course, problematical, but it will be considerably less than the $35,000,000 expected besides jeopardizing the $50,000,000 no obtained from the present duty. In other words the decreased imports are not likely o realize any duties to the United States more than is being at present realized and if this be true an investment of $1,000,000,000 of American capital has been ruined or ruined to a great extent in the hope that a revenue will be produced.

The American companies that now operate in Cuba have and expect to continue to pay large taxes to the United States, both in the shape of corporate taxes and income taxes. To ruin this industry or cripple it will deprive the United States of obtaining these taxes to a far greater extent than the amount of revenue expected to be obtained through the tariff increase. Our own sugars produced in this country and our insular possessions pay no duty and furnish no revenue to the Government in the sense of a duty equivalent to the tariff; therefore is it fair to the American investment in the sugar industry in Cuba to cause a duty to be paid due solely to the mere fact that Cuba is classed as a foreign country?

Cuba was originally a Spanish possession, the same as Porto Rico and the Philippine Islands. At the successful termination of the war with Spain we acquired by purchase the Philippine Islands and Porto Rico was ceded and they became part of the United States.

Cuba was granted independence. The United States looked with approval on the effort of the Cubans to establish an independent from of government. Cuba was granted full, free, and independent government (except as limited by the Platt amendment) by the approval of the United States. The entire industry of Cuba revolves around sugar; it is its life, it is its main artery; cripple or ruin it and the entire economic life of Cuba is at an end.

While granted independence, the two other sugar-producing countries, the Philippine Islands and Porto Rico, gained measurably more by becoming a part of the United States, as their sugars came in free.

Cuban sugars pay a duty. Our unselfishness in granting Cuba independence should not be made a sham independence, if her main article of livelihood is taxed merely under the guise of being a foreign country. It must pay a duty on its principal and practically sole commodity, especially when it appears that that commodity for all practical purposes is owned by Americans and American capital.

Nor will any of our own industries engaged in the sugar business be affected. Prior to the admission of the Hawaiian Islands it was claimed by our beet-sugar industry that ruin would stare it in the face if these sugars were admitted duty free. That ruin has not taken place, but the beet-sugar industry has been more prosperous than before. When the Philippine Islands and Porto Rico were admitted, the same claim of ruin was advanced, and again it did not happen. When Cuba was granted a 20 per cent differential under the reciprocity treaty, the claim was again urged not only by the beet-sugar industry but this time by the Porto Rico and Philippine sugar interests, but again it did not happen. These interests went on and prospered just the same. But there is a limit to the amount of duty which can be exacted, and the proposed tariff would be ruinous to the American interests in Cuba as well as Cuba itself, for the following reasons:

For many years and up to the time of the World War the sales price of Cuban sugars was around 2 cents a pound. The United States Equalization Board bought the Cuban crops of 1917–18 and 1918–19 at a fixed price. These years are no criterion, and the conditions which existed in 1919–20 after the armistice, when prices of all commodities increased to unheard-of levels, furnished no comparison; but this year we find that the price of Cuban sugar is down to approximately 2 cents a pound in Cuba.

The proposed duty amounts to nearly as much as it costs to produce a bag of sugar. When sugar was selling in Cuba at 2 cents a pound prior to the war, it was generally conceded that a well managed mill could earn about one-third of a cent a pound, depending upon its location, the condition of its cane, and its milling machinery.

At present, that is during this year, at the price of 2 cents a pound for raw sugar in Cuba no such profit could be made for the very obvious reason that the price of production has increased enormously and is not yet back to prewar levels. As a result practically all the sugar mills in Cuba operated this year at a very large loss. And on top of this they have been compelled to stand, as previously shown, the loss entailed by the increased Fordney tariff which it is proposed to perpetuate.

If without this increased tariff a loss was had, it needs no citation of figures or extended argument to show that the loss would be so much greater by reason of having to stand the increased tariff. It simply will mean the inability to continue the in-

dustry and even if the cost of manufacturing is reduced to prewar levels, it will not compensate for the increased tariff but the loss will be simply lessened.

It is only by the exercise of the strictest efficiency and modern economic methods without the burden of the increased tariff that the American investment in Cuba can be safeguarded to a point where it will not be obliterated and an extremely small profit obtained.

For these reasons your committee is requested to give serious heed and thought to the gravity of the situation and to at all times realize that in its final analysis this increased tariff solely affects Cuba because the other full duty paying sugars play but a small part in our consumption and that it is mainly American capital in Cuba that is being penalized and its very existence seriously threatened.

It will be for others to point out additional reasons in opposition to the proposed tariff.

This brief is not concerned with the Cuban point of view, however urgent and meritorious it may be, it is concerned solely with American industry operated in Cuba with a belief that it should have the ample protection which this country seems to have extended by its treatment of Cuba and its treaties, and the protection the other American sugar industries now obtain.

SHOREHAM HOTEL,
Washington, December 19, 1921.

Hon. DAVID I. WALSH,
United States Senate, Washington, D. C.

DEAR SIR: At your request and in view of the testimony elicited before the Senate Finance Committee to-day in reference to the sugar schedule, especially the plea of the beet-sugar witnesses that their industry was suffering and needed the protection of the proposed tariff, we deem it proper to lay before you certain facts with reference to the beet sugar industry which may be of interest in view of their contentions.

The Great Western Sugar Co. is unquestionably the largest of the beet-sugar producing companies, and, according to the testimony given by its president, Mr. W. L. Petrikin, before the Ways and Means Committee in January of this year, when the Fordney emergency tariff legislation was under discussion, it appeared that his company produced 30 per cent of the entire amount of beet sugar produced in the United States. The company does not publish for distribution any annual report, but the following facts are well known and will be found in any manual of sugar companies. The company's present outstanding capitalization is: Preferred stock, $13,630,000; common stock, $15,000,000.

As shown in the last published report of the American Sugar Refining Co., the latter company owns 31 per cent of the stock in this company. During 1919 and 1920 and until January of this year the regular dividends of 7 per cent were declared on the preferred and a total yearly dividend of $47 on the common stock. In other words, in a little over two years this company declared more than the face value of its common stock as a cash dividend to its stockholders.

This company operates some 16 factories in Colorado, Montana, Wyoming, and Nebraska, and is one of the best managed and most efficient beet companies in the United States. Owning plants distributed over quite a large area, it has been able to build up a large capital and surplus under the tariff existing before the passage of the emergency bill.

In other words, the growth and success of this company was entirely accomplished under the Payne-Aldrich and Underwood tariff acts.

Likewise the American Beet Sugar Co., which has a number of plants located in California, Colorado, and Nebraska, is capitalized as follows: Preferred stock outstanding, $5,000,000; common stock outstanding, $15,000,000. This company has paid the following dividends:

Year.	Dividends paid.	
	Preferred.	Common.
1921	$6.00	$2.00
1920	6.00	8.00
1919	6.00	8.00
1918	6.00	8.00
1917	6.00	20.00

Another very successful beet-sugar company is that of the Spreckels Sugar Co., which owns a large plant in California. There is no published report concerning this company but its stock is owned one-half each by the American Sugar Refining Co. and the Spreckels family. This company has published no statement of earnings, but it is splendidly located and it undoubtedly has built up a large capital and surplus.

If objection be made to the fact that we have picked the years 1919 and 1920, when high prices were paid for sugar, we respectfully refer you to the report of the Beet Sugar Industry in the United States, published May 24, 1917, by the Federal Trade Commission. This commission, by the way, made its report on conditions in the beet-sugar industry in the United States by reason of the fact that an investigation was ordered by the Commissioner of Corporations, at the direction of the Secretary of Commerce, because of complaints on the part of farmers that they were not receiving a fair price for beets. The Federal Trade Commission, in an exhaustive report in chapter 5, treated of the investment, capitalization, and earnings of beet-sugar companies. It examined companies whose production aggregated 98.6 per cent of all the sugar produced in the United States. It found in the period under investigation, which ranged from March 1, 1910, and the fiscal year ending nearest the same date in 1914, that for the companies producing practically all the beet sugar in the United States in that period the average annual rate of earnings during the period covered, after taking account of depreciation, was 11.6 per cent.

On page 123 of this report it is stated that the companies examined, "taken collectively, were overcapitalized to the extent of $9,579,105, or 8.3 per cent." Complete schedules of the overcapitalization are set forth in the report.

It does not appear from any governmental reports what average earnings were made by the beet-sugar companies during the period from 1914 to 1919. We have given the figures for certain companies for 1919 and 1920, and respectfully suggest that you require of the witnesses who are going to appear for the beet-sugar industry to furnish you with a statement of the average earnings of their companies engaged in beet-sugar production for the years 1914 to 1919; that will, at least, show whether or not they prospered during the period that the Underwood tariff was in effect.

So much for the profits made by the beet-sugar industry. When it comes to the question of the relative cost of production between beet sugar and Cuban cane sugar, we refer you to the following:

Tariff Information Survey, paragraph, 177, article 1913, page 32: "In all of the regions in which domestic sugar is produced, except perhaps Louisiana, a considerable proportion is produced at a cost as low as, or lower than, that of the marginal Cuban costs. Such producers would be able to continue to compete with Cuba if there were no duty, so that profits would be less."

On the question of the protection sought for American labor engaged in the beet industry, the testimony given by S. M. Edgell, vice president and treasurer of the Amalgamated Sugar Co. of Utah, operating in Utah and Idaho, before the Ways and Means Committee, is of interest, especially in view of Senator Smoot's statement this morning that in his State, Utah, none but Americans were employed. Mr. Edgell, in testifying with reference to conditions in Utah, was asked by Chairman Fordney the following:

The CHAIRMAN. Mr. Edgell, ever since I have been in Congress this question of labor on sugar has been up. It was first brought up in Congress, since I have been a Member, when the Cuban reciprocity act of 1902 was considered, along there, and finally passed in 1903; then again when the Payne-Aldrich tariff bill was up in 1909, and then when the investigating committee, called the Hardwick committee, were investigating conditions, and was up again in 1913, when the Underwood tariff bill was

passed, and every time that this question has been brought up it has been defended by the refiners and everybody who opposes any duty on sugar, or who is in favor of decreasing the duty on sugar, or is in favor of a lower rate; it has been contended that the western beet-sugar manufacturer employs very largely Japanese, Chinese and Mexican cheap labor. To what extent are these statements true, and, if true what is the percentage of those nationalities which you now employ in the beet fields where you are operating?

"Mr. EDGELL. Well, where we are operating we employ, to my knowledge, no Chinese whatever. I can not give the percentage of the Japanese, but there are some. We employ quite a lot of Mexicans that we brought in in order to work in the beet fields. I would have to be a little more careful in answering the question, because I have only been associated with the company which I am now representing for about a year and a half. We have been compelled to bring labor in from Mexico because we could not get it from anywhere else."

Very respectfully, yours,

HENRY A. RUBINO.

STATEMENT OF M. E. GOETZINGER, REPRESENTING ARBUCKLE BROS., NEW YORK, N. Y.

Unlike the other sugar refiners who are represented at this hearing we have no interest whatsoever, direct or indirect, in the production of either cane or beet sugars. We are refiners pure and simple, whose raw material must be bought in the open market and whose selling price of the refined product must reflect all costs of manufacture and the cost of the raw material including the duty imposed on Cuban and other dutiable raw sugars. We will, therefore, confine our remarks to a refiner's view of the pending tariff bill, and that view is the view of an American manufacturer working on dutiable raw material. His problems include the investment of considerable capital, the employment of labor in large volume, the production and transportation of heavy tonnage, the good will of a wide circle of customers and finally a profit for himself. In these problems he does not differ much from the manufacturer of domestic sugar except in the one important respect that, unlike the latter, the refiner does not ask a bounty in the shape of a protective duty. The two face the same difficulties, are of equal service to their respective communities, and are entitled to the same consideration and protection of the law.

Somewhat roughly stated, the total consumption of sugar in this country is about half domestic and half dutiable, and necessarily every argument advanced in favor of fostering the domestic sugar industry as a stabilizer of prices and a factor in competition, applies with precisely the same force to the eastern refined cane sugar. So too the employment of capital and labor in the one industry is as important to the country as in the other. With a refinery located in New York, our raw material must be imported. We can not use domestic raw beet sugar because none is made in this country. We can not often use Louisiana cane sugar because very little or none at all comes north. We do, however, use the raw sugar of our insular possessions and in the past have worked on large quantities of raw sugar from Porto Rico, Hawaii and the Philippines, but all sugar from these insular possessions commands the duty-paid price of Cuban sugar. Furthermore, our insular possessions do not produce enough sugar to supply the demand of the Eastern States, and thus the use of Cuban raw sugar is not a matter of choice, but of necessity, and therein lies our interest, for if the cost of our raw material were to be legislated out of line with the law of supply and demand there would result a depression in the refining industry involving unemployment of labor, idle capital, diminished supplies of cane sugar to compete with beet sugar and correspondingly increased cost to the consumer.

As usual at hearings of this character, the consumer has no spokesman at the present hearing. His only rôle is to pay the bill. We hold no brief for him, but he is our customer; without him our occupation is gone, and so in his behalf we volunteer the request that his interests be not wholly overlooked nor wholly sacrificed in order that a distant domestic industry may thrive. Let it be recalled that on the Atlantic coast the consumer lives in large numbers, wholly dependent for his sugar on the eastern cane refiners, for he does not raise sugar beets, no beet sugar is made in his home States and none is shipped there because freight charges preclude it. This one item of transportation of a commodity that runs into such tremendous tonnage as does sugar necessarily relegates both beet and cane sugar to a natural zone of its own, separate from the other by a neutral zone in which each may participate on equal transportation terms. When, however, as has happened, the domestic industry diverts part of the advantage which the duty gives it over eastern refined cane sugar to absorb part of the freight charges on shipments into the eastern cane zone, the consumer living in the

eastern States who pays a large part of the tariff bill, has just cause to hold up a warning finger and ask to be heard from. Furthermore, some six or eight thousand of these eastern consumers earn their living as employees of the sugar refineries in New York Harbor alone, and when to these are added the employees in the refineries at Boston, Philadelphia, Baltimore, and Savannah, and the many others who find useful employment in the sale, transportation, and distribution of the eastern refined cane sugar, there is an aggregate of eastern labor that is entitled to considerate attention every time that the domestic industry presents new demands for still higher bounties.

The eastern refiner and his customers the eastern consumers, must now view with some alarm, the suggestion that the solution of the present sugar problem is to be worked out largely at their expense. On that point it is respectfully urged upon your attention that the present extremely abnormal condition does not offer a fair standard wherewith to measure a tariff differential between beet and cane sugars. The abysmal drop in price, unparalleled in the history of sugar, coupled with the extraordinarily high costs of production in war days, and which still persist in a measure, have so violently disrupted the relationship between the producing costs of the two sugars that to build a tariff differential between the two on such shattered foundations would lay too heavy a burden on the consumer. Cost differentials in the two industries are bound to reach their old parallel again, and as the lines approach each other from day to day an artificial tariff differential based on to-day's conditions would simply take us from one extreme to the other and lead to confusion worse confounded.

And let us not overlook the very important fact that the present distressed condition of the sugar industries in this country was not brought about by abnormally large importations of Cuban sugar, but by the large surplus of sugar that is still in Cuba and only knocking at our doors for admission. To put another lock on our doors will not make the Cuban surplus vanish, nor lessen by one whit its depressing influence upon the world's sugar market, either behind our double-locked doors or outside them. The inexorable law of supply and demand may not be so easily thwarted. Just so long as that surplus exists will it weigh heavily upon and depress the entire sugar market, no mat'er where the surplus sugar be stored. The faster that it is consumed the more quickly will the crisis be passed. The crisis is not local but world wide, and to shirk our fair share of the unpleasant results by shoving them upon other nations would be not only cowardly but futile as well. Normally the United States should consume about one-half of the Cuban crop. To levy additiona tribute on Cuban sugar for the purpose of shutting off its customary outlet, will not only accomplish that purpose, but by holding the price of sugar in this country above the world price, obviously will restrain instead of encourage consumption. On the day that the surplus sugar, wherever it be shall have been consumed, the sugar problem will be a thing of the past. Then, why defer the coming of that day by impeding its approach in any manner.

We respectfully urge that the duty on sugar be left where it was before the emergency tariff bill increased it, and that in due time sugar be placed on the free list and be required to contribute to the Nation's tax bill only in the same proportion that the domestic article is required to contribute.

A new and truly startling innovation in the present House bill is the proposed discrimination against the eastern refiners by giving to beet factories and to refiners of domestic cane a substantial reduction in the duty on all foreign sugars which they may choose to use in their establishments. A more brazen and un-American proposal scarcely can be conceived nor can we believe that it will receive the serious consideration of your committee. We therefore dismiss it with the observation that its constitutionality is so grave a question that it might well be feared that to include it in the new bill will put the entire bill in jeopardy.

The other phase of the situation remains to be stated and then we are through. As cane sugar refiners we are not blind to the fact that the beet sugar interests and the southern cane sugar interests have as good a right to engage in and remain in the sugar business as the Atlantic coast refiners. But the question now is not one of fundamental right; it is a question of how much the consuming public shall be charged for the privilege of keeping these home industries in business.

We have hereto addressed the Congress with reference to the economic phase of the sugar question and we reaffirm every statement made in t the past. The demands of home producers, however, have grown so great that another question of paramount importance has come to the fore which affects our responsibility as a nation. The question of import duties on Cuban sugars is not only economic, but is a question of national honor. It comes up at a time when the world is critical and when we have undertaken to lead the peoples of the world into the light of international altruism.

We have in this Capitol City a beautiful structure known as the Pan-American building in which there is now sitting a conference of nations which looks to the

betterment of all people by the limitation of armaments. Far-reaching results are already assured. But what a travesty: Where one body sitting in Washington seeks world peace by the limitation of forces that make for war, and another body chosen by popular favor and sitting in the same city, is being besought to continue and increase discriminations that invite retaliation and which must inevitably end in the breaking of cordial international relations.

A nation that undertakes to do certain things in an international way and then forgets, can hardly expect to merit the continued confidence of the world.

In 1898 we sent the Spanish navy to the bottom. We took over a qualified protectorate of Cuba and hailed "Cuba Libre." Then our Congress with patriotic fervor granted a preferential of 20 per cent of duties on importations from this favored island. Now our generous national impulse faces the assaults of the favor seekers, at whose behest the pending bill contemplates an increase under which the 80 per cent will be just about as high as the 100 per cent duty in effect before the Spanish War.

STATEMENT OF EDWIN P. SHATTUCK, REPRESENTING THE CUBAN-AMERICAN, FRANCISCO, TUINUCU, AND TACAJO SUGAR COMPANIES.

The American producers of sugar on the island of Cuba have a deep interest in the tariff on sugar because of two imposing facts: First, they represent more than 50 per cent of the sugar production of that island, and, second, Cuba supplies the United States with about 50 per cent of its annual consumption.

In considering the proposal contained in the House tariff bill it is necessary at the outset to recognize the fact that the rates there proposed have an adverse effect only on Cuban sugars and not those of other foreign sugar-producing countries, as the importation of full-duty sugar for the past 10 years, with the single exception of last year has been negligible. The advocates of the bill, as passed by the House, openly state that its purpose is to build a higher tariff wall against the Cuban product. As was said by Mr. Martin, when this bill was under discussion in the House:

"In considering the duty upon sugar, the Cuban product alone is to be considered, and it is against the importations from that country that we must be protected."

And again:

"As nearly all of the sugar imported into this country comes from Cuba, the Cuban tariff alone need be taken into consideration."

This remark seems not only untimely because of Cuba's present deplorable economic condition but is seemingly void of an appreciation of the intimate political, geographic and economic unity of the two countries.

It is therefore essential that we consider this subject from the point of view thus expressed, that this proposed legislation is in fact directed against Cuba, and in examining its effect the special relations existing between Cuba and the United States should be fully recognized.

Cuba, a sovereign and independent State, is nevertheless under the protection of the United States, both by the latter's announced policy and course of dealing, and also by the treaty agreements between them. By her acceptance of the so-called Platt amendment of March 2, 1901, Cuba has limited her treaty-making power with other foreign powers and her power to incur public debts, and has consented to take a position which practically renders her a dependency of the United States, in so far as her relation with other powers is concerned. We quote from the Platt amendment as follows:

"*Restrictions on treaties.*—That the Government of Cuba shall never enter into any treaty or other compact with any foreign power or powers which will impair or tend to impair the independence of Cuba, nor in any manner authorize or permit any foreign power or powers to obtain by colonization or for military or naval purposes or otherwise, lodgment in or control over any portion of said island.

"*Restrictions on public debt.*—That said Government shall not assume or contract any public debt, to pay the interest upon which, and to make reasonable sinking fund provision for the ultimate discharge of which, the ordinary revenues of the island, after defraying the current expenses of government, shall be inadequate.

"*Intervention by United States.*—That the Government of Cuba consents that the United States may exercise the right to intervene for the preservation of Cuban independence, the maintenance of a government adequate for the protection of life, property, and individual liberty, and for discharging the obligations with respect to Cuba imposed by the treaty of Paris on the United States, now to be assumed and undertaken by the Government of Cuba."

The imposition of these restrictions on Cuba's rights as a free and sovereign State has placed the United States under very strong moral, if not legal, obligations to tha

country. Cuba stands to-day under the guiding and restraining hand of our Government: she makes no unusual move without the tacit consent or pronounced approval of our Government. In fact, Cuba's relation to our Government, except in form, is little different from Hawaii and Porto Rico. But because of this difference in form the two latter islands are given the blessings of free importations, and to Cuba is proposed a tariff higher than has existed for 30 years.

This fertile island, largely given to the sugar industry, lies almost at our shores; it is nearer to the metropolis of America than is New Orleans. Its wealth of production is in great measure the result of the capital and labor of American citizens; its great industrial development draws its supplies almost wholly from the United States.

It is estimated that the capital investment of United States citizens in Cuba exceeds $1,000,000,000. It is more than the combined investment of our people in the sugar industry of the United States, the Philippines, Hawaii, and Porto Rico.

Also it may be said with some pride by those who are interested in Cuban affairs that she buys more in commodities from the United States than do the dependencies of Hawaii, Porto Rico, and the Philippines combined, each of which are now accorded a preference over her of $1.60 per hundred pounds on sugar. But this comparison is to speak slightingly of Cuba's imposing position as a customer of the United States. And this has a vital meaning to every farmer, laborer, and manufacturer in the United States. What are the facts?

During the last year Cuba imported from the United States over $515,000,000 worth of products. More than the combined exports to Argentina, Brazil and Chile, and almost as much as was exported from the United States to all South American countries.

An examination of the reports of the Secretary of Commerce shows that Cuba as an export market for our products was in the calendar year 1920 only exceeded by the United Kingdom, Canada, and France. Of all the countries in the world Cuba is fourth in respect to the value of our exports.

"Increase our export trade" is the slogan of the day. Yet with this enormous Cuban export market already in our hands, we would destroy it. Eminent authority has said that Latin-American countries are the fields to which we must look for our export development. Cuba is to-day the greatest and most fertile of all of these. Why try to dethrone Cuba? Let her utilize her preeminent position in sugar culture to supply the markets of the world. The revenue thus received will be used by Cuba for purchasing products from the United States. The markets of Cuba are of vast importance to our industrial life and especially to our rice, wheat, pork, and other food producers and to the textile, iron, steel, and machinery industries.

If we destroy the Cuban sugar industry, or lessen its prosperity, or by your action drive Cuba into other commercial alliances in order that she may preserve her very life, we, in the same measure, decrease the export of our food, fuel, and manufactured commodities to Cuba. We submit for your earnest thought that this market is worthy of retention and expansion. It should not be destroyed or divorced at the behest of those interests which seek a prohibitive tariff. Wise statesmanship can not be turned to such a use.

Not only is the extensive trade between Cuba and the United States of unestimated value to the producer and manufacturer in the United States, but it is of immense value to our shipping interests and especially at this time when the problem of the American merchant marine is so acute. A large volume of trade between the United States and Cuba is carried on almost exclusively in ships of American registry. For the calendar year 1920 vessels of American registry engaged in this trade amounted to [illegible],138 tons out of a total tonnage of 9,477,047.

In dealing with Cuba the United States should take these commercial facts and its political associations with Cuba into serious consideration. To impose another barrier to the commercial relations between the two countries, by an added tariff duty on sugar is comparable to a request of Louisiana, because of her high producing costs, to ask that her product be protected against the beet sugar industry of the West, and that a tax be placed on the latter in order to protect the producer against losses in Louisiana. The two countries are too intimate politically and too closely associated commercially to permit the addition of a new and increased burden on Cuba's essential industry, and the dependable source of our own supply of this prime commodity.

Our understanding of the dominant party's idea is that tariff legislation should be based on the principles of protection; not only protection to American industries but to her population; not protection to a small favored group of American citizens but protection that will be felt largely and broadly by her whole people; protection that tends to make our country independent economically; that brings to us from abroad at low cost those articles which we need, and in return gains for us a market for our surplus products. We believe that these principles are woefully disregarded in the proposed bill.

It is also the aspiration of every nation that she will always have at her command her supplies of any essential commodity. How better can the United States assure itself of this essential commodity than to foster and protect the sugar industry of Cuba. In reviewing our industrial history of the late war where will you find a more striking example of such assurance of a needed supply than that accorded by Cuba to our Government in the case of sugar.

When the United States declared war against Germany in April 1917, Cuba, on the following day likewise declared war against Germany. In doing so she was guided only by the thought to serve her northern neighbor. Her action was of great importance; with her long seacoast she prevented harbors to the German fleet and early took decisive action to prevent the spread of enemy propaganda in her own territory and adjoining countries.

Soon after war was declared Cuba met the requests of the United States Government in immediately placing at its disposal the entire sugar production of the island at a price far below the relative prices of other important food commodities. Again in 1918 Cuba sold to the United States its entire sugar crop, at a time when it was evident that she could have sold her sugar crop in the markets of the world at more than double the return which she had received under the arrangements made with the United States, and also, at the behest of our Government, greatly augmented its production to supply the crying needs of the United States and its allies. Her cooperation was full and complete. She took no note of her great industrial gain by holding aloof, but in the true spirit of the alliance which had been built up between the two countries she came to its support. In 1919, after the war, she offered her crop again to the United States in the interest of a stable and reasonable price; she did this at a time when it was well known that sugar prices would rapidly advance and that the world's sugar shortage would make a demand on her product, at whatever price she choose to fix. It is of interest here to recall the warning given by the mission representing the Cuban Government as to the disastrous results that would follow if Cuba's offer was not accepted. In the letter written by the mission to our Government this language is used:

"If, on the contrary, the opportunity to serve—not the American people alone but the universal welfare—is for any reason, technical or otherwise, not availed of through one medium or another, there is not a community anywhere in America, in Europe, or Asia that will not feel the consequence of our failure to provide a stable price for this most necessary article of human consumption."

The United States unfortunately failed to heed Cuba's warning and declined to accept her offer for the 1919–20 crop, but the earnestness of the offer showed her desires and purposes. This prophetic warning of the Cuban Mission was only too true. The fear of sugar scarcity drove the price of sugar to 23½ cents per pound and brought sugar to us from all parts of the world. When the fear subsided and reason ruled the collapse came, and not only in our country but throughout the world financial distress and suffering were the inevitable consequences.

The United States producers of sugar in Cuba ask no favors but they expect no discrimination from the hands of their Government. This sugar industry has been developed and expanded upon the faith of the reciprocity treaty and upon the basis of the tariff rates prevailing prior to the enactment of the emergency tariff which were found after careful survey and study to represent a differential that would fairly equalize between the costs of production in the United States and its possessions and Cuba, and which would permit legitimate sugar industries here and there to prosper.

The rate fixed by the emergency tariff act, which the tariff bill as passed by the House proposes to perpetuate, increased the duty on raw sugar of 96° test from 1.256 cents to 2 cents a pound. Under the reciprocity treaty of December 11, 1902, between the United States and Cuba, the latter has a reduction of 20 per cent from full duty on all importations of sugar into this country. On the basis of 2 cents duty Cuba pays 1.6 cents per pound as against approximately 1 cent per pound before the enactment of the emergency tariff act. Under this act the producer in Cuba has been compelled to absorb this additional duty of 0.6 cent per pound. The day before this act was signed by President Harding Cuban sugars were selling at 3.875 cents, and on the following day at 3.275 cents, or a decrease of 60 cents per 100 pounds. It is estimated that the coming into force of this act depreciated the value of the raw sugar then in Cuba about $35,000,000.

The emergency tariff act was a severe blow to Cuba. It followed the unfortunate occurrences that had befallen that Republic since the collapse of the local banks and the moratorium last year. It became operative at the end of May during the peak of the Cuban crop and during the stagnation of the sugar market in general and when the financial crisis in Cuba was at its height, and when Cuba was trying to sell

her high-cost sugar at not too great a loss. She is still staggering under its disastrous effects.

We also desire to call attention to the bearing of this increased tariff on the reciprocity treaty between Cuba and the United States. For a few years succeeding the treaty Cuba received the benefit of the differential of 20 per cent provided therein, but since her sugar production exceeded the requirements of the United States, Cuba has received no part of this differential. Immediately after Cuba ceased getting the benefits of this differential the United States consumer received it. The United States Tariff Commission in its 1921 edition of Tariff Information Surveys on Sugar, at page 31, states this proposition as follows:

"In 1903 a reciprocity treaty was arranged with Cuba providing for a reduction of 20 per cent from the full duty on all importations from that country. So long as considerable importations continued under full-duty rates, it is safe to assume that the price established in the international market was enhanced in the United States by the full duty, and that therefore the remission of 20 per cent to Cuban producers was simply so much bonus to them and of no benefit to American consumers. The Cuban manufacturers added the 20 per cent to their former price and pocketed the profit. Under such stimulus, however, Cuban production rapidly increased, and ultimately competition brought down the Cuban price again to the international level. This process has been estimated to have required about five or six years. By 1908 to 1909 the American consumers were receiving the benefit of the 20 per cent reduction. Full-duty sugars were from that time on virtually excluded."

In striking contrast to the fact that Cuban sugar producers receive no part of this differential is the tremendous advantage to the United States exporters from the differential accorded to them. Under the treaty Cuba admits all United States products at a preferential ranging from 20 to 40 per cent. The United States producers and manufacturers of these products receive the full benefit of this preferential, as Cuba buys very little, if any, of similar products elsewhere.

There are many commodities that Cuba could buy abroad cheaper than from the United States, such as machinery, locomotives, rails, railroad cars, automobiles, shoes, and all kinds of leather goods, and luxuries, were it not for the differential allowed to the United States under the reciprocity treaty. The increased price that Cuba pays for these and other commodities in the United States, goes directly to the United States producer and manufacturer. On the other hand, Cuba receives no part of the differential allowed to the importation of sugar into the United States from Cuba. Cuba is required to meet the world market price in her sale of sugar to the United States, but the United States may sell to Cuba at a premium over the world market equal to the differential allowed to her under the reciprocity treaty.

If Cuba is to be denied the reciprocal advantages which she had supposed she would receive under the reciprocity treaty, she necessarily must take steps to prevent paying increased prices for commodities to the United States. when she can secure them at a cheaper price in other foreign markets. This will inevitably require Cuba to modify her own tariff schedules and to increase her duties against American goods in order to be in a position to buy cheaper elsewhere. The Cuban tariff has not been changed since the reciprocity treaty was concluded on December 11, 1902. Products of the United States enter Cuba to-day on the same terms and with the same advantages as when the treaty was signed, yet Cuban sugars have not only lost the preferential, but it is seriously proposed to burden them with a permanent increased tax of 60 cents per 100 pounds.

The mistaken contention has been advanced that as the value of imports from Cuba to the United States exceeds the value of our exports to Cuba the reciprocity treaty has worked to the disadvantage of the United States, by giving a balance of trade in favor of Cuba. But the facts are that the moneys paid from Cuban industries to the United States in transport hire, interest charges, dividends, taxes, etc., have more than offset the excess of import over export commodity values.

An examination of the arguments that have been made before and will be made now by the advocates of the House bill leads to no other conclusion than that the purpose for striking down the normal, advantageous, and desirable relation which existed between the United States and Cuba prior to the emergency tariff act, is that the beet sugar manufacturer in this country may have a subsidy accorded to his industry.

We contend that for all legitimate purposes a differential of 1 cent per pound between Cuban sugars and those of the United States is sufficient and more is unwarranted. If to expand the domestic industries we must add a further differential against sugars produced in Cuba, which is part of our own political and economic system, then this expansion should not be fostered. Illegitimate industries should never be subsidized by our tariff. Under the differential mentioned there is ample

room for the sugar industries of both Cuba and the United States and for the legitimate expansion of each. It is believed that a differential of approximately 1 cent a pound as between our insular possessions and Cuba is amply sufficient to cover any disparity between the cost of production in the respective countries. It is also a well known fact that legitimate domestic beet sugar industries have prospered under the recent tariff schedule. The United States Tariff Commission in its Tariff Information Survey, above referred to, at page 31, shows that only a small proportion of the beet sugar industry of the United States is dependent upon the tariff. They say:

"Taking the industry as a whole, roughly speaking, about 20 per cent of the output is dependent upon the tariff."

It is a recognized fact that the United States can never hope to produce all of its sugar requirements. Porto Rico and Hawaii, it is conceded, have obtained their maximum output. The Philippines have increased somewhat, but the total will be small and the Louisiana crop is capable of no expansion but has shown a considerable reduction in recent years. In the light of experience it is also unlikely that the United States beet crop is capable of any substantial increase. Certainly the consumption of sugar in the United States will increase more rapidly than the production of domestic sugar can be increased.

The present consumption in the United States is about 4,500,000 tons, of which the United States produces in the aggregate about 2,250,000, leaving 2,250,000 tons to be imported, which in former times all came from Cuba. A 1-cent duty on this importation amounts to about $50,000,000 duty per year. Under the present tariff bill, with Cuban sugars paying $1.60 per hundred pounds, the duty collected would equal about $81,000,000. Compare this with the total increased cost to the consumer to arrive at which we must figure 1.6 cents per pound on the total consumption of 4,500,000 tons, which amounts to approximately $162,000,000, of which $81,000,000 would go directly to the domestic producer.

We do not believe the Government can justify this increased tariff as a revenue measure, for if this is the purpose to be accomplished it would be better to levy a 1-cent duty on sugar to protect the producers in the United States, and a tax of some form on the entire consumption of sugar. This would result in considerably less tax on the consumer and an additional revenue to the Government. Surely it can not be justified on the theory of protection, for to do so we must admit the wisdom of striking down the extensive market now existing for lucrative export trade in many lines of industry, of denying the American consumer his natural source of supply and imposing on him a higly artificial tax to subsidize an exotic beet production and to award an excessive profit to the favored Porto Rican, Hawaiian, and Philippine producers as well as to those legitimate beet sugar producers who have greatly prospered under our recent tariff.

It should be recalled that for the 10-year period prior to the war sugar sold at an average price of about 2½ cents per pound. To-day San Domingo full-duty sugars are quoted c. i. f. United States ports at 2.06, or an f. o. b. price San Domingo of about 1.91. The 2-cent duty on these 96-degree test sugars is about 110 per cent. Is such a tax to be continued on one of the most important items of the food supply of this country? Is the American consumer to be required to pay over 100 per cent protection on an article like sugar to producers who can not hope to furnish enough for the American consumption, especially when they can get this article at their very door? Even the tariff rate on luxuries does not approach this astounding rate on sugar.

The increased tariff imposed against Cuba by the emergency tariff act of 60 cents a hundred pounds is a heavy burden to her. On top of the very high production costs that prevailed while the recent crop was being made we have had a colossal decline in sugar values. This decline has been brought about in great measure by the very large crop of Cuban sugar, which was the result of the stimulus given to Cuban production through the entreaty of our own Government during the war. These high production costs and the relatively very low prices for sugar have thrown the island into financial chaos. It would seem to be an anomaly that one department of our Government should have sent its special representative to Cuba to inform and advise it during this commercial crisis and should be seeking remedial measures for the assurance of the island's financial and economic recovery and another department should be considering the enactment of a measure that will have the effect to preventing its rehabilitation and will be a permanent menace to its industrial life.

It is pertinent at this time to call attention to the words of President Harding, reported in the New York Times of April 12 of this year, on the occasion of the opening of the direct telephone communication between the United States and Cuba. President Harding, in talking over the telephone with then President Menocal, is reported to have said:

"This time is especially auspicious for the exchange of assurances that our two Republics are bound together by indissoluble ties of sympathy and interest. Our fortunes have been linked together already in two history-making struggles, and to-day, when Cuba stands under the shadow of a national misfortune, I want you to know that the United States is determined as always to prove itself the true and helpful friend of your nation."

This message was given within a day or two after the suspension of payment by the National Bank of Cuba, which followed a period of distressing industrial and financial conditions in Cuba and indicates a sympathy and understanding of the close political and commercial relations which exist between the two Governments. Yet, notwithstanding these sentiments, Congress to-day by its tariff legislation is proposing to build a barrier between the two Governments and to force Cuba into a position where she must look for her very life to some other commercial alliance.

Are our people to look complacently on and witness a tariff of above 100 per cent placed on their sugar requirements, and see a market for half a billion dollars of their farm and mill products taken away by intemperate legislation?

The investment of American money in Cuba produces more than twice as much sugar as is produced in continental United States, and in excess of the total sugar production of the United States, including its insular possessions of Hawaii, Porto Rico, and the Philippines. It is therefore earnestly requested that the foregoing facts be given careful consideration, in the sincere belief that they are sufficient to warrant your committee in reporting a sugar schedule which will accord to Cuba and in equal measure to the United States the treatment which is justified by the many ties of commerce and friendship between the two countries and which will also tend to preserve the investments of the United States in this island. To this end our petition is that the duty on Cuban sugars be reduced to at least the previous rate of 1.0048 cents per pound which was in effect up to May 28, 1921.

STATEMENT OF HORATIO S. RUBENS, REPRESENTING THE AMERICAN COMMITTEE ON CUBAN EMERGENCY, NEW YORK CITY.

Senator McCUMBER. Give your name and address and state whom you represent, for the information of the committee.

Mr. RUBENS. My name is Horatio S. Rubens, 40 Exchange Place, New York City. I represent the American Committee on the Cuban Emergency, and several other gentlemen in connection with the Cuban sugar industry who have surrendered their time to me so that I might explain the situation as a whole.

Senator McCUMBER. Proceed in your own way.

Mr. RUBENS. Inasmuch as we are to be heard before the gentlemen who are to speak in favor of the bill, there are several things to which I would like to call the attention of the committee by way of answering certain statements, arguments, and objections that have come to our attention—criticisms made of the Cuban situation, of the producers in Cuba, of the opposition to the American interests in Cuba and to the Cuban Government itself.

I think this is absolutely essential for the proper consideration of this question, no matter whether you sympathize with beets or sympathize with Cuba. The question is very plain. We are not here to ask for any free trade. We appreciate the situation of the American beet industry, particularly, as an example of their situation which is common to producers of sugar, whether Hawaiians or Porto Ricans or Louisianians or Filipinos, the beet or the Cuban producers—but there are certain principles which we would like to place before the committee for its deliberation, with the idea not of injuring any American interest but of preventing the injury to those interests ultimately through the immediate injury and paralysis of the situation in Cuba.

Senator SMOOT. Are you a member of the American Commission on Cuba?

Mr. RUBENS. No, sir.

Senator SMOOT. Or the Cuban Commission, I should say.

Mr. RUBENS. No, sir; I have had nothing to do with the commission. You mean the old commission?

Senator SMOOT. It ceases to exist on the 31st of this month?

Mr. RUBENS. Yes, sir; I understand that is its fate. No. I will say, Senator—I am speaking in an individual capacity—that I was in Cuba at the time when it was proposed, and I opposed it. But it was submitted to the approval of the State Department in the United States, and by and with the consent and approval of the State Department it was created.

Senator SMOOT. I do not know the history of it down here; I did not know what it was in Cuba altogether, and I thought that if you had been connected with it I would like to ask you some questions about it.

Mr. RUBENS. I must confess that while I was consulted, my opinion was not taken, and I was opposed to it because I felt that it was an ephemeral measure, would simply tend to hold up the ultimate situation, was an attempt to fix a price artificially in spite of the overplus of the supply to the demand, and for those reasons I was opposed to it.

However, one of the charges made against Cuba is that she brought about not only her own present condition but that of the sugar industry as a whole. One of the charges is that undue speculation and ambition to make more and more money brought about this situation. I think, in view of the fact that we want to do justice to the one and to the other, and particularly as I was impressed with the remarks of the honorable Senator who pointed out the condition of the market because of the holding back of sugars, when, as he said, there were ample sugars in the United States and in Cuba to take care of the demand; it was then that the American Government through its officials stepped in and practically requisitioned the importation, which ultimately amounted to 800,000 tons of foreign sugars, which brought about the disaster. I was very much interested, Senator, in your statement that there was enough American and Cuban sugar in this country, so that if the speculation was on the part of the Cubans it was also on the part of the Americans, and the further statement that a great deal of the sugar that was made at a very high price in 1920 in the beet district met with the same misfortune that the Cubans met. They also held their sugars and they were not sold until the spring of 1921.

Senator SMOOT. It hit the beet people harder than it did any of the cane-sugar people for the reason that the beet-sugar people have got this contract one year ahead for their beets, and they had the contract for beets for 1920 when sugar was away up in the air, and those beets were not manufactured for the next year, and when manufactured were produced from $12 beets they found a $6 market.

Mr. RUBENS. Yes; but it was the United States Government that was responsible for this.

Senator SMOOT. I am aware of that.

Mr. RUBENS. That precipitated the situation.

Senator SMOOT. But, I want to say, be fair to the Government, too. Their advisers did not take the position that some of us did, that there was ample sugar; they took the position that there was not.

Mr. RUBENS. I am trying to disclose, Senator, if I may, that the Cubans, who may have made a mistake, and probably did, some of whom were naturally overambitious, had the same example, as was shown to you to-day, of the fixation of price by the Attorney General, in the case of Louisiana at 17 to 18 cents, and the banner of speculation was nailed to the foremast of the vessel.

So that my plea is: Please do not blame the Cubans entirely for the very natural assumption that when in November or December of the year previous to their making their crop, Louisiana was authorized to charge 17 to 18 cents, so it was no marvel that finally, in May and June, the raw sugar went up to 23 cents.

Senator SMOOT. That is a fair statement.

Mr. RUBENS. The other charge against Cuba—and I am reviewing some of the charges against Cuba so as to smooth down some of the acrimony of the debate, and anything that I may say which may appear to be a criticism of anybody else is only said in the way of defensive argument to some of the offensive statements which are perfectly proper in debate. Several gentlemen in the House of Representatives have called attention to the fact that the balance of trade in Cuba was against the United States. I will not go into the details which have been touched upon by Mr. Atkins and his reply that you have to take into consideration interest paid, insurance and transportation and the dividends which were earned by American companies. But I wish further to call attention to the fact that a great deal of sugar in these last years came to the United States, apparently sold to the United States, but only passing through the process of refining and then reexported by the refiners. So that, furthermore, this should be taken into consideration in amelioration of the charge that the balance of trade has been in favor of Cuba. I remember some years ago when I was in San Domingo and then came to Washington that the newspapers pointed with a great deal of glee and satisfaction to the fact that under our auspices San Domingo had the balance of trade in her favor. That simply meant to me, after I had seen the conditions in San Domingo, that after dividends were declared by foreign companies that owned the main production of San Domingo, which at the time was sugar, the population of San Domingo was on a bare wage, and therefore they could not purchase more than their country exported.

The balance of trade is not an argument against the trade with Cuba. We do not say to the rest of the world with which we have formed trade, "We do not want to trade with you because you are not fair; the balance of trade is not in our favor."

Senator MCCUMBER. That balance of trade was due to the fact that the only thing that Cuba had to sell us rose enormously in value during that year, was it not?

Mr. RUBENS. Yes.

Senator MCCUMBER. It did not increase other exports outside of sugar to any appreciable amount?

Mr. RUBENS. No.

Senator McCumber. And the amount of sugar was not particularly increased?

Mr. Rubens. Oh, yes; its value and the volume of sugar, too. There was a considerable increase in sugar.

Senator McCumber. But not as much an increase in weight of sugar as the increase in value?

Mr. Rubens. No. There was an increase in a few years from two and one-half to nearly four million, Senator.

But you have touched upon another point which should not be forgotten in connection with Cuba, and that is that we are dealing with many nations that have a number of products, but with few nations that are almost entirely dependent upon one main product, and such as is the sugar crop of Cuba.

I do not want to take the time of the committee on useless details, but the Senator made a statement which I just took down hastily on a slip of paper, that for the price of beets now paid—which I understand is $6—the Cubans could lay down and refine their sugar at the eastern seaboard.

There is a slight mistake about that, Senator, because if you figure 235 pounds——

Senator Smoot (interposing). It is 233 pounds.

Mr. Rubens. I took five because it was easier to figure—at $6 you get 2.55 cents a pound——

Senator Smoot (interposing). And that is what they are laying sugar down now for in New York.

Mr. Rubens. But not refined.

Senator Smoot. There is a cent's difference in that, and you are laying it down in New York at 2.55.

Mr. Rubens. That is a part——

Senator Smoot (interposing). And then if you add freight and the handling of it to get it to the mill, you will find out that you can deliver Cuban refined sugar in New York at no more to-day than the saccharin in the $6 beet, without our putting an ounce of work on it in slicing and manufacture.

Senator Watson. At what are you laying it down in New York for now for January delivery?

Mr. Rubens. For January delivery, I understood, 2 cents, cost and freight.

Senator Smoot. That is 96 rough?

Mr. Rubens. And that means that afterwards—and I wish to call the attention of the committee to it, because the Senator doubtless understands the method of calculation—when there is a protection of 1 cent or 1.6 or 2 cents on sugar, it means this, that is only the tariff—there is an additional protection.

Senator Smoot. You say there is an additional protection?

Mr. Rubens. Yes; there is an additional protection in this way that when the beet sugar cost is calculated it is the cost of beet sugar ready for market, a refined product. When you figure on Cuban sugar it is raw sugar, which must be transported to a refinery, and that refinery must get its cost of refining plus its profit; and then there are lost in that process of refining 7 pounds of raw sugar which have already paid the duty, to every 100 pounds of raw sugar which are refined. In other words, only 93 pounds of refined resulting from

a hundred raw, and the entire hundred they paid their duty on, and they have to pay for every pound of sugar to the refiner, plus profit; and when they get in competition with beets they have to pay considerable freight from the seaboard to the competitive zone.

Senator SMOOT. You can get a freight rate from New York to Chicago, where our market is, for less than one-half of what you can get it from our factory to Chicago—that is the advantage we get. And, another thing, I wanted you to understand that the dollar a hundred, or cent a pound, that I stated, you know that is added on for the refined charges and the losses?

Mr. RUBENS. Yes, sir. When the cost of raw sugar is low——

Senator SMOOT (interposing). That is what it is to-day.

Mr. RUBENS (continuing). When the cost of sugar is high, it goes up; and by the same token, when the price was fixed by Mr. Hoover for the purchase of the Cuban crop, the Equalization Board added on 0.35 cent per pound, or 35 cents a hundred, which, in effect, was for the benefit of the domestic sugar producers, and the result of that was that there was accumulated some $30,000,000 which went out of the profit of the transaction on the importation of Cuban sugar during that period and became merged with the general funds of the United States.

Senator SMOOT. You want to be perfectly fair. But that 35 cents that was added on was because everything that the beet refiner bought increased over 100 per cent—everything that the beet sugar refiner purchased increased over a hundred per cent—bags of all kinds, limes of all kinds, acids of all kinds, bone black, and everything else increased over 100 per cent, and Mr. Hoover allowed them to have $1.35 instead of $1.

Mr. RUBENS. That 35 cents represented about $30,000,000 which the Cubans lost during the operation of the sale.

Senator SMOOT. Not at all.

Mr. RUBENS. If they had gotten the same price and the same level as the American producer they would have had $30,000,000 more, would they not, Senator?

Senator SMOOT. Evidently; of course, Cuba had to pay more for her goods, too. There is not any doubt about it. It happened in everything that occurred in business—everything went sky high, and, of course, Mr. Hoover allowed 35 cents for refining charges and differential and loss from 96 raw to granulated, and I do not think that that was unreasonable, and I believe that you will say that it no doubt did cost the refiner that much.

Mr. RUBENS. I do not envy anyone the profit they did make, because after all they have to contribute by way of excess profit, charges, and other things to the exchequer of the United States.

A great deal has been said in criticism of Cuba lately as to labor. The statement that 65 cents is the fair and general charge at the present time, I think, needs a certain amount of explanation.

I heard that this was to be used as an argument, Senator, and I had the curiosity to ascertain what was being paid in Porto Rico at this time and, rather to my surprise, I find it is 50 to 60 cents.

Senator SMOOT. I do not deny it at all; and, for one thing, I think of course, if it were possible to avoid, it should be avoided.

Senator MCCUMBER. That is labor in the field?

Senator SMOOT. In the field.

Mr. RUBENS. And, of course, the Senator has explained——

Senator MCCUMBER (interposing). That has reference to labor in the fields?

Mr. RUBENS. Yes; that has reference to labor in the fields at a time when there is practically no necessity for that labor, because they are just about ready to harvest their crop. It is not a question of economics; it is not a question of actual costs either in Porto Rico or in Cuba, Senator; it is a question of common humanity. They must have something or they starve.

Senator WATSON. Do they pay 50 cents on the average or more; what is the truth about that statement?

Mr. RUBENS. The truth about that statement is that there is no work at this season, and rather than permit the people around you to starve, you invent, if you please, some operation in the field which otherwise would be unnecessary.

Senator WATSON. Is that 65 cents wages paid the year around?

Mr. RUBENS. No.

Senator SMOOT. I do not say right now, because I heard it two months ago. I had an investigation made and I have that report now; and they have been paying it. I have not the report here, but I will be glad to put it in the record—and they had been paying that price for common labor in the field for a month past.

Mr. RUBENS. And it may be that in some cases they paid for labor simply by giving enough to keep them from death and from starvation.

Senator SMOOT. We can not do that in our country.

Mr. RUBENS. But, Senator, there was no sugar cultivation in the fields. And may this be a grain of comfort to all of us: The latest estimate of the coming crop in Cuba is not 3,900,000 pounds as it was last year, but it is 3,000,000 tons.

Senator SMOOT. Three million two hundred thousand is what was given to me.

Senator WATSON. Do they pay more for labor than for harvesting the crop?

Mr. RUBENS. Naturally, and they will just as soon as they begin harvesting.

Senator SMOOT. And if Cuba would limit the crop this year to 2,250,000 tons she would get more money out of her sugar.

Mr. RUBENS. But as to the proposition of importation from Cuba only a few days ago there was one made in the nature of an embargo on Cuba. She was told that she would only be permitted to bring in 2,000,000 tons, and then she would have the benefit of the emergency tariff or the Fordney tariff, and if she brought in 500,000 tons more she would be penalized.

Senator WATSON. Who told Cuba that?

Mr. RUBENS. That was the proposition, I think, invented by some of the beet sugar gentlemen. And another proposition which was recently invented is still more ingenious——

Senator CALDER (interposing). How will they control it?

Mr. RUBENS. How will they control it? They will have commissions controlling in Cuba and commissions controlling in this country. But the other suggestion, which I think has not met with

any serious consideration, was that a price could be fixed which would be a living price for American sugar producers, and then let us assume that was 2.9 cents a pound for Cuba. If she sold for anything than 2.9 then she would pay a proportionately higher duty. So that if a farmer, for instance, were told to sell his wheat at $1.50 and he sold at $1.40, his taxes would go up; and then if he sold for $1.25 they would go up still further.

I am the first one to agree, Senator, that something ought to be done to take care of the actual situation in Cuba, which is a menace not only to this country but to herself.

I am the first one to agree with that principle, but I am here, unfortunately, to argue a question which I want to bring to your attention, and that is if the Fordney tariff is assumed to be a permanent tariff, not a question of doctrine of the present condition—of trying to save all the people interested in sugar, whether the stockholders be the stockholders of the American Continental Beet Producing or cane corporations, or whether they be the stockholders of American corporations producing sugar in Cuba. I think there ought to be no discrimination, and I believe there is none in fairness between the American investors whether they are in beets or whether they are in Cuban corporations.

Senator SMOOT. I do not want to assent to any such proposition. To me, as an American citizen, I would very much prefer to have my products manufactured in America. If your theory is correct, to have free trade or to have all the advantages of cheap labor from a foreign country, all you have got to do is to tell the cloth manufacturer and the cotton manufacturer, the jewelry and toy manufacturers, "You go and invest your money in Germany, and we are going to protect you, and you will have it come into this country without any protection whatever," in order to protect American money invested in Germany. I say I would like to do that so far as the laws of Germany, but when it comes to the question between a manufacturer investing his money in America, employing American labor, paying American wages, paying taxes, to help maintain the American Government, I am going to stand by him before any other American who is manufacturing his goods to come into this country from any other country in the world.

Senator WATSON. Of course, that brings up the whole question of tariff.

Mr. RUBENS. That brings up another question which I am very sorry to have to touch upon.

Senator WATSON. Do you agree with the statement made here a moment ago that the Fordney emergency tariff has no effect whatever in the maintaining of the price of sugar and in sustaining American industry?

Mr. RUBENS. I have a letter from Mr. Fordney here somewhere, in which he calls the attention of one of his colleagues to the fact that the result of the increase of the duty on sugar has not raised the price to the consumer.

Senator SMOOT. For the reason, of course, that the sugar condition is such that the market has been steadily dropping.

Mr. RUBENS. Exactly.

Senator SMOOT. But if it had not been, there would not have been any sugar industry in the United States left.

Senator WATSON. Suppose you made the tariff five times as high as we did. Would not the American producer have the benefit of the entire American market?

Mr. RUBENS. When you have had before you the various figures—when you get some to-morrow from the beet people, you will find they are all very ingenious and made by gentlemen who have their pencils sharpened at both ends, and if you ask them the basis of calculation of so many cents per pound you will find it was on the old exchange rate and not on the new. If you take the new exchange rate it would be quite a different thing.

Senator SMOOT. That has nothing to do with the specific rate of duty?

Mr. RUBENS. No; except that it works on an ad valorem basis. In the case of Cuba, you have to take the ad valorem basis in order to ascertain whether or not there is any article which has imposed upon it anything comparable in ad valorem under the present conditions.

However, Senator, your declaration that the investments of Americans in Cuba do not redound to American interests as do those in the West, where you have American labor, etc., I wish to say that it is only a raw material, as you well know. It is brought into the United States to be worked in refineries. I am holding no brief for refiners or refineries. They are here to speak for themselves. But they, too, are American interests.

Senator SMOOT. Sure.

Mr. RUBENS. And I believe their investment is between $400,000,000 and $500,000,000 as against $175,000,000 of the beet industry, and they, too, are in a condition where they should be respected. They also engage tens of thousands of American labor, if you please.

Senator WATSON. Have the American refiners investments in Cuba?

Mr. RUBENS. They have some; they have now two estates in Cuba. Heretofore they have had none, but it seems that the policy of Mr. Havemeyer, who sought to insure his investments in the American Sugar Refining Co. by taking up a good deal of the stocks of the original beet producing companies, which I understand are still held and are very profitable as a source of income to the American Sugar Refining Co.—I understand that he, in his wisdom, sought those investments in the beet industry so as to protect himself if the prophecy which was then made should hold good sooner or later—early in beet culture it was prophesied by one beet sugar man that the United States would in ten years produce enough sugar to export abroad in competition with European sugar.

Senator SMOOT. The refiner gets his money without a question of doubt. He takes no chances whatever in buying his sugar, because he sells his sugar and buys it from Cuba at the price it is—Cuba regulates the price, so that the Sugar Refining Co. is perfectly safe. It is not like the man who puts the seed into the ground, raises the beets and then refines them and prepares the product for the market.

Mr. RUBENS. Senator, if you will pardon me, since the middle of 1920 the refiner has been in the same position as any other purchaser on inventory: He has found his inventory has shrunk and all durin

this year he has found that certain gentlemen have nipped the price below, so that he hardly dared to go into the market to purchase. He found that after every purchase, and before he could refine there was a still further slump in the price.

But, getting down to the question of Cuban labor: The labor in the agricultural beet fields in the West consists of Mexicans, of Japanese, and of Russians.

Senator SMOOT. Of course, so far as my State is concerned, that is not true. I do not know how other States are, and it is only limited to other States. When they could not get the labor, there were some Mexicans here who were allowed to come in temporarily. But that is not so this year. They have all had to go back, and the Russians who came in here from Canada have all been sent back.

Mr. RUBENS. We brought this question up. There is, unfortunately, a late report of the United States Department of Labor, Children's Bureau, showing the effect of working the children in the sugar beet fields in Colorado, a partial review of a part of two counties in Colorado. I will just quote a few words [reading]:

> Postural deformities and malpositions apparently due to strain were shown by 70 per cent of more than 1,000 of these beet-working children who were examined by a physician of the Children's Bureau. The continued stooping when engaged in "thinning" and the lifting and handling of heavy weights in "topping" are believed to affect the growing child's body unfavorably.

Then they go on to show that out of 930 school children from 9 to 16 years of age in the study from home school records obtained 40 per cent were from 1 to 7 years below the normal grade of their age.

They also show an average of 9 to 10 hours a working day of children working between the ages of 8 years to 12 years.

This is all official; this is the official report of the Children's Bureau.

Senator SMOOT. The only time a child goes into the beet fields is for thinning, and all he can pick up is a bit of grass or weeds, or the little beets which have just sprouted.

Mr. RUBENS. These photographs [exhibiting photographs to the committee] show them pulling beets.

Senator SMOOT. Let me tell you, they do not pull beets.

Senator WATSON. They only thin them out?

Senator SMOOT. They plow the beets out and then pick them up.

Mr. RUBENS. Here are photographs [exhibiting further photographs to the committee] showing the topping operations. Here [indicating] are some children engaged at the work, which are very interesting, as they are actual photographs from the fields.

Senator SMOOT. Of course, I do not know who they expected to deceive by saying that children pull the beets out of the ground. That is not done by anybody—man, woman, beast, or anybody else; they are plowed out. And you hardly ever see a child in the fields after the thinning is over. A child can thin beets but with very little effort. When they put the seed in the ground, which is done by machinery, the seed sprout, and always they have to plant more seed than is necessary. But in order that the beets may develop they have to thin them out. If there were any possible way of getting rid of that the beet growers would be very thankful, indeed. But in thinning the boys or girls go along usually on their knees, and just

pull them out where too many have sprouted, leaving one healthy plant there; and that is the limit of the work that they do.

But as far as loading or pulling the beets out of the ground, or topping them, you see men do that.

Mr. RUBENS. I merely was assuming that the Children's Bureau of the Department of Labor was correct in its report so far as Colorado is concerned; and this is a report of the National Child Labor Committee in connection with similar conditions in Michigan [referring to another report].

However, when we come——

Senator SMOOT (interposing). I want to say to you that, so far as the child labor of Utah is concerned, thinning of beets has been a godsend to the children. Instead of their running on the streets and going everywhere, they get something to do, and during 1919 and 1920 some of those children made over $3 a day thinning beets.

Mr. RUBENS. That brings us to another point about the agricultural part of the beet production, and my understanding is that the operation is performed under contract, with laborers who receive so much an acre for the entire agricultural operation from the thinning to the ultimate topping and stacking.

Senator SMOOT. That may be done in some places. In Utah a man never has more than 5 acres, and he and his boys attend to it.

Mr. RUBENS. I am speaking now of contracts which I have seen, and have available forms.

Senator SMOOT. There are contracts; there is no doubt about it.

Mr. RUBENS. Available forms——

Senator SMOOT (interposing). There are contracts; there is no doubt about it.

Mr. RUBENS (continuing). I understand that the present price paid for the agricultural care of the beet after it is planted, and it is thinned, and it is weeded, and it is hoed, and after it is dug by machinery, in some places, it is separated from the dirt that adheres to it, and it is topped, and it is piled and then loaded, is somewhere at the rate of $25 an acre; and according as to how many children there are in the Russian family, so is the measurement of the success of that family resulting in taking 15 and sometimes 20 acres. That is a condition, undoubtedly, not true in your part of the country, but it is true in connection with some of the larger beet-producing corporations.

I further call attention to the fact, on this question of labor, about the proposition with which you gentlemen concerned are doubtless aware, that a man who formerly occupied a very high position in the Hawaiian government is now in Washington for the purpose of obtaining the free admission of Chinese coolie labor for Hawaii which I will say, by the way, is absolutely impossible so far as Cuba is concerned, because of the condition imposed on Cuba by the United States at the time of the ratification and exchange of the reciprocity treaty whereby it was distinctly understood and agreed to by Cuba that she would maintain the same immigration and exclusion laws that we have. So there can not be anything used in Cuba except native labor.

Senator SMOOT. Cuba has not been in the same situation as the Hawaiian Islands, although Chinese can not enter there unless——

Mr. RUBENS (interposing). I wish to call attention to the fact hat there is in Congress such a proposition in order to cheapen the abor in the Hawaiian Islands.

Senator SMOOT. It is not altogether the cheapening of the labor, I want to say to you, because I know the situation very well. The Hawaiian sugar business is absolutely in the control of the Japanese. You can not do anything in the Hawaiian Islands unless you have the consent of the Japanese; in fact there are only two classes of labor that amounts to very much there that would ever work in the cane fields, and you know what a different job it is after it is burned and how they have to load it, and it is an awful job, and the Japanese absolutely control conditions in Hawaii.

Mr. RUBENS. As to the increase of the Cuban crop, I have already alluded to the fact that the coming crop will not be 3,900,000 tons as last year, but about 3,000,000 tons. That comes about through various sources of a changed condition in Cuba. One is that there was no replanting in 1921 for the 1922 crop, perhaps for the best reason in the world that there was no available money.

The next thing is that despite the fact——

Senator SMOOT (interposing). What do you mean by "replanting"—the seed?

Mr. RUBENS. By "replanting" I mean, Senator, that in certain parts of the Island of Cuba, notwithstanding all that you hear of the wonderful fertility of the soil, particularly in the western part of the island which has been cultivated for nearly a century constantly, you must replant; you must put the plow into the rattoons and tear them out and replant them then to the extent of 20 or 30 per cent a year.

Senator SMOOT. What I meant was, rattoons or seed?

Mr. RUBENS. Yes. The cultivation of cane, also due to the lack of funds, was not up to the usual agricultural performance in Cuba, and that means another shrink.

There is another possibility, but that is only a possibility, and that is by reason of faulty cultivation and excessive rains during the growing season there will be a shrinkage in yield.

Senator SMOOT. It is agreed by all that the production in Cuba this year will not exceed 3,200,000 tons.

Mr. RUBENS. They have at least had that virtue, if only from necessity, they have not voluntarily replanted any cane for the coming crop.

Senator SMOOT. If something does not happen here to take care of the beet sugar people, there will not be any replanting at all.

Mr. RUBENS. The beet sugar people, unfortunately, took their chances, because after it was proven that both they and the Cubans had a surplus, after the Sugar Sales Commission was appointed in February, in order to take care of the market of the Cuban surplus and Cuban crop, it was then that the beets went into the ground to an unfortunately large extent.

Senator SMOOT. We could not avoid it. The contracts were made, and the contract was made on the basis of $12 a ton for beets.

Mr. RUBENS. I am not criticizing, but I am trying to prove that the present difficulties are not entirely due to the acute foolishness of the Cubans themselves.

Senator SMOOT. And that was done under the direct instruction of the Attorney General?

Mr. RUBENS. They have in Cuba, as well as you in the beet sections, suffered from the intervention of the American Government, and from the point of view of the foreigner he at least has some measure of charity and courtesy due him in the consideration of his problem.

I want to say further something as to the criticisms of the Cuban people, not here but elsewhere: The statement was made that the Cubans are ungrateful; why should we do anything for them? Why should we have any consideration? When the high cost of living was bothering all peoples of the earth, when the prices began to crash in Cuba and elsewhere, the American Government—you see I am still speaking of the American Government—appealed to Cuba in order that Cuba might protect American producers of rice, who had made consignments and sales of rice—a great necessity in Cuba, a daily food and prime necessity of life; at prices that were very high. Cuba did not say, "I am for Cuba first. I do not care anything about the United States rice people, or the United States banks." Despite the fact that it was inordinately high in Cuba, they placed an embargo on the importations of rice at the request of the American Government and for the benefit of the American rice industry.

Senator SMOOT. And on a very high price for the rice?

Mr. RUBENS. At a very high price for the rice.

Senator SMOOT. Which was the price Java was asking, and the price that they could bring it from Java into Cuba?

Mr. RUBENS. Yes.

Senator SMOOT. That is all it was.

Mr. RUBENS. But the embargo was there, and a free trading proposition would have relieved the necessities in Cuba, and would have reduced the cost of living, and yet Cuba did not say "Cuba first."

Senator SMOOT. Because she has always had every chance in the world to come in at 20 per cent preferential with her main crop. I am not complaining of that, nor am I complaining against Cuba, I am just looking out for the United States.

Mr. RUBENS. About the differential, I am going to quote an authority with which you do not entirely agree, Senator. It is, however, an authority; and that is the Tariff Board. They say on page 329 of their 1919 publication, that "the reciprocity arrangement did not result in any sales to the United States of sugar, which but for the reciprocity would have gone elsewhere."

Senator SMOOT. That was true under conditions.

Of course, at that time England was perfectly willing to buy sugar anywhere in the world.

Mr. RUBENS. And let me go on to say as to the reciprocity treaty [reading]:

In this year (1913) the amount of protection to the domestic producers and the producers of the noncontiguous territories was less by the amount of Cuban preference than the rate of duty on the tariff act. In 1914 up to the outbreak of the war the American consumer was getting the whole of the benefit from the preference to Cuban sugar.

That is to say, that the Cuban had lost his preference and the American consumer was getting the advantage of it; and that is the situation acutely now and will be the situation so long as Cuba has a sufficient amount of the sugar; the difference between the full duty and the preferential duty is not for the benefit of the Cuban.

But I want to be perfectly fair, Senator, and admit that when you raised the tariff from 1 cent to 1.6, then the old principles which we recognize as good protectionists took effect; that is, the foreigner pays for the increased duty, and the American manufacturer, on the other hand, so far as his production is concerned, gets the benefit of that increase of impost upon the foreigner.

Senator SMOOT. We do not disagree on that at all.

Mr. RUBENS. I just want to call attention of some gentlemen to the fact that when you say that Cuba has this preferential she has in fact lost her preferential so far as full-duty-paying sugars are concerned, and she has lost it ever since she produced a little more than enough than was required to come to the United States.

When we say to Cuba that we are giving her this market, why, Senator, if we could produce in this country and did produce all our needs and requirements, there would not be any market for Cuba. We are not giving her anything except that to which she is entitled because of her proximity and because of her close political relations to the United States and because we need her sugar.

On the other hand, it is said that we Americans have given everything and received nothing. In the past 10 years the exports from the United States to Cuba have been in round numbers nearly $1,600,000,000. Cuba by reciprocity treaty has granted the United States not 20, but 25, 30, and 40 per cent. So, taking the average as that of the minimum 20 per cent, American manufacturers have in the past 10 years received the direct premium or benefit to the extent of $320,000,000, and it is because they have received that direct premium and benefit, and because of the increase of trade by producers in the United States that they have joined the committee over which I have the honor to preside, and place before you in evidence the necessity of keeping up their trade, by not completing the ruin of Cuban industry just as they have no desire to see any American industry ruined. We ask you to weigh very carefully not merely a local business of certain States in the West, not only the interests of certain stockholders in the beet and cane industries of continental United States, but the interests of those who have invested—according, again, to the gentlemen of the Tariff Commission—because "the United States has greatly profited by the opportunity of profitable investment of capital in Cuba," which you will find on page 322 of their 1919 statement.

There seems to be some little confusion about the question of what was the Equalization Board's profit at the time of the purchase of the Cuban crop by the United States. I do not want to take the time of the committee to read the few figures which I have jotted down, but I do wish to call your attention to a statement showing that the Equalization Board's profits, not profit to the refiners, but the profit which was established over and above the margin, went, so far as the domestic producer is concerned, to his benefit, and, so far as the Cuban producer is concerned, it went to the benefit

of the Equalization Board and became merged in the Treasury of the United States.

With reference to the question of child labor, it does not seem to have been the custom in the State of Utah. I have here as far back as 1916, for February, the child labor bulletin showing the conditions in Colorado, and portraying the conditions in the schools at the time of full attendance and at the time of the beet harvest. Some of these are very interesting indeed.

Senator McCUMBER. Do you know of any farming community in the whole United States where children do not work as soon as they are big enough to work?

Mr. RUBENS. But during the school year——

Senator McCUMBER (interposing). Many of them work during the school year, at least at all times when they are required to do the work. The harvest time is generally the time of vacation.

Mr. RUBENS. Yes; that is true.

Senator McCUMBER. Conditions on the farm, so far as I know them, could be much worse than they are to-day. Isn't it a fact that the child, from the time it is big enough to hunt eggs until the time it can do heavier work, has to do some work on the farm?

Mr. RUBENS. That is true in a way. But these children are not usually American children. They are children of foreign birth and foreign extraction. I have here a little report, which was made confidentially, showing the conditions. The observer says:

> It is making the problem of Americanization more difficult. The American children are beginning to make much of this class distinction. I asked a boy at school if he ever worked in beets. He said, "No, indeed; we Americans don't have to; we make the Russian and Mexican kids do that."

In the Russian families a large number of children is considered a prize. The statement I have in regard to this is as follows:

> A Russian counts each child as an asset, and when his wife bears him a new boy he considers himself $5,000 better off. Their women are valued for the number of children they can bear. One a year is the rule, more if possible. A child is seldom called upon to support his widowed mother, for there is no such thing among them as a widow with children. The more children she has the quicker she is married again. If a young man can marry a widow with children he considers himself just that much ahead. A minister of these people tells of a Russian who was burying his wife. While standing by the open grave he had his hand over his eyes with his fingers spread, and was crying with one eye and looking for a wife with the other. He was married again in a very short while.

I shall submit this bulletin of the child labor organization and also some extracts from confidential reports showing the conditions of all workers.

(The bulletin referred to is as follows:)

CHILDREN WORKING IN SUGAR-BEET FIELDS IN COLORADO.

The United States Department of Labor, through the Children's Bureau, has just issued some preliminary figures regarding the findings in a study of children who work in the beet fields, one of a series of studies which the Children's Bureau is making of the work of children on farms.

The study covered parts of Weld and Larimer Counties in Colorado, and included 1,077 children under 16 years of age who did beet work. While some of the beet growers plant small acreages and depend upon their own families to do the handwork which is involved, the great majority hire contract laborers for the handwork. Over seven-tenths of the working children were the children of these contract laborers. In the area studied in Colorado four-fifths of the laborers were resident; that is, they

ved in towns near the beet fields, moving out to the farms in the spring and returning to their homes after the harvest. About 70 families, however, were those of transient laborers, recruited by the sugar companies, often from distant parts of the country. Many of them were attracted to the beet-growing areas by the fact that the whole family could work in the fields.

Children thinned out the small beet plants in the spring, hoed, pulled up the beets, and "topped" or cut off the beet tops at harvest. The worked at very early ages. Over one-fourth of them were under 10 years old, a small percentage under 8. Less than one-fifth were as much as 14 years old. Considerably over half were from 9 to 13 years of age. Physically, the most harmful feature of the work probably lies in the long hours. From 69 to 85 per cent (according to the process in which the child was engaged) worked 9 hours or more a day. From more than one-seventh to one-third (again varying with the process) worked 11 hours or more. Thinning and blocking in the spring and pulling and topping in the autumn are both done under more or less pressure; the first process must be done before the beet plants grow too large; the second before severe frosts occur. Hoeing is done in a more leisurely way during the summer, but it is the spring and fall processes in which the younger children are most generally used. The average working day for all processes was usually between 9 and 10 hours. Postural deformities and malpositions apparently due to strain were shown by 70 per cent of more than 1,000 of these beet-working children who were examined by a physician of the Children's Bureau. The continued stooping when engaged in "thinning" and the lifting and handling of heavy weights in "topping" are believed to affect the growing child's body unfavorably.

Mr. RUBENS. The point about it is that these workers are not American farm workers; they are not American citizens; many never will be. They are Japanese; they are Mexicans; they are Russians of a certain type that perhaps never will become citizens, or, if they do, they will be the fathers of children and the mothers of children that, for lack of education, will be a real menace to the community, because as they grow up in vast numbers they can outvote the local American population. And then you are going to have another local question besides the question of tariff on your hands.

I shall say this, further, about the cost of production in Cuba. The cost of production is not the reflex of the present sales price. When the point was brought out to-day that sugar for January delivery is 2 cents a pound, I wish it distinctly understood that this is not a reflex of the cost of production of that sugar, because there has not been a sale of sugar from Cuba, or, I am willing to admit from any other source, that has come into this market since the beginning of this year that has not been sold under the cost of production. But, gentlemen, sugar—the beet-sugar industry and the cane-sugar industry of Louisiana—is not alone in this plight. There is not a single industry in the United States that is not in the same plight. You may look at your farmers who are raising corn and wheat and oats. They are in the same plight. Look at the production of steel, of copper, or of any commodity of which there has been a surplus or a hangover, or even where there is not any in the hands of the producers, but the United States Government, through its war purchases, has a great surplus. You will find that same condition in many other lines of industry.

It is not because we are fearful that the tariff which is proposed to you in the Fordney bill is not a remedy for the specific needs of the moment that we ask for your consideration, but it is because we fear that by reason of the peculiar circumstances of the moment you will be argued into taking action definitely on a tariff which is going to prevent Cuba from ever coming back and from ever making profit because of a law which, when once placed on the statute books,

we may not be able to persuade you to expunge, and which, as I hope to show you, will prevent Cuba absolutely from making any profit on a prewar basis.

Six-tenths of a cent, which is an addition to the tariff as it existed before the emergency tariff bill, represents upon the unit of production in Cuba, which is sack of 325 pounds, $2 per bag.

I wish to call the attention of the committee to the fact that in prewar times the best situated mills in Cuba were satisfied with a profit of anywhere from one to two dollars a bag. This six-tenths of a cent (additional to the tariff paid before the passage of the emergency tariff bill) which is sought to be perpetuated in the Fordney bill is just $2 per bag. If the principle of protection, as we understand it, worked out properly in normal times at the old rate, never mind whether it works out now.

What I am afraid of is that you are going to legislate under abnormal conditions and in so doing continue to paralyze Cuba when normal conditions come along.

I say that that $2 a bag which Cuba will have to pay is harmful, because if the exporter, the foreign exporter, does not pay the tax, then the American consumer pays it; and I believe we are all good enough protectionists not to believe the latter. This extra 60 cents a hundred, or this extra $2 a bag, on the unit of Cuban production, simply means that when normal conditions are reestablished, the Cuban sugar mills best situated can never hope for a profit.

I want to call the attention of the gentlemen who are producing sugar in this country to a few serious facts. They and the Cuban producer are really in the same position. The ruin of one is not going to help the other; the ruin of Cuba is not going to help the beet industry. Quite the contrary. In the process of ruining Cuba you will be up against what they are now, which is this—ruinous and bankrupting competition against which there is no tariff protection. There is no protection against that. The worst thing that can happen is the continued lack of credit from which the Cuban industry suffers, and that is why, despite the increase of the tariff by 60 per cent, the price has not increased. It is because the supply was too great; because there was no credit in Cuba to hold the sugar and because those who suffered from necessity had to dump their product on the market; and that condition will be more acute when the control of the present Finance Sales Corporation is off.

Senator WATSON. What tariff will you be content with?

Mr. RUBENS. I am not a plenipotentiary of Cuba, but I am simply arguing the facts for your decision, keeping in your minds that what we want is not the amputation of a leg on the theory that it will cure the itch.

Senator WATSON. You have been arguing in generalities in an attempt to show the production in Cuba and in the United States, but you have not told us what you want.

Mr. RUBENS. One cent. We want that under which there was ample security for the American product.

The point of fact is they have increased their factories. The point of fact is that they have declared, despite all the troubles and difficulties that they tell you they have gone through, heavy dividends. In some cases, I believe there was a 100 per cent stock dividend

n other cases, a 47.5 per cent extra dividend in one year. They have been prosperous. There is no jealousy on the part of the Cuban producer, but we see that the situation is such in Cuba that it has become necessary for this Government, not only to exercise, as it always has, a protectorate in Cuba, but to send a plenitotentiary to Cuba for the purpose of counseling, advising, directing, and restraining on all subjects, not only politically, but economically.

That raises a question entirely different from that of any other nation in relations with the United States. We need not go back far in the history of Cuba and her relations with the United States. Some gentlemen have said, "You spent too much money on her." I think, so far as the people of the United States are concerned, they have never regretted, and they never will regret, having declared in the war with Spain for the principle which later was consolidated in that greater war through which we have just passed. It was the first time that a great Republic sacrificed its treasure and its blood for the purpose of establishing another free government.

Not content with that, it became the champion of that government. It has protected it; it continues to protect it. But there is no use in protecting it physically, if you are going to ruin it economically, and there is absolutely no reason why the beet gentlemen should fear annexation any more than they should fear intervention, because if we should actually intervene, not in name as we did and have, through the presence of Gen. Crowder in Cuba, but if we step in and tell the Cubans, "You can not keep your house in order; you can not run your government properly; you are a menace to the existence of such a stable government as is covered in the Platt amendment and the treaty, and therefore we will take charge of you," then this country could do only one thing, which would be to show to Cuba and to the world that, having taken possession, it could do better than Cuba; and it could not do better than Cuba if it did not right the question of the income of the Cuban Government. That income depends upon customhouse receipts, and, in turn, they are dependent upon the purchasing power of the people, and the purchasing power of the people is dependent upon the economic and trade conditions in Cuba, which are all based upon the main crop—sugar. Therefore, if there is any intervention, the United States would either fail in getting a sufficiency of revenue, or it would have to do what was done when the Republic of Cuba was first established and when Secretary Root, who has been quoted to you, made his declaration of principle, and when President Roosevelt made his, and when that great banner bearer of protection, Mr. Payne, among other things, said that "the United States would be recreant in its duty if it failed to create conditions which, by assuring Cuba a favorable market, would render her prosperous."

And in the debate, against all the protests of the gentlemen whom you are about to hear, and who have told you in past years how the admission of free Hawaiian sugar, the admission of free Porto Rican sugar, and how the admission of the Philippine sugar would affect conditions, he held to his view.

I do not blame them for wanting to get as much as they can, but I ask you gentlemen to consider the history of the protests of these

very same interests. They have cried "wolf" so long that I think you ought to look into the facts and the figures. The fact is that, despite the influx of island sugars free of duty, they have continued to increase and to prosper.

A situation would arise under the circumstances that I have endeavored to point out which would cause any governor who might be named in case of intervention in Cuba to use the same words Governor Wood used in 1902. He said, "Relief must be granted and granted quickly or a condition will arise which will render the establishment and maintenance of the stable government highly improbable."

This is not an ordinary tariff question.

The peculiar relationship, once established, and now continued with Cuba, our real intervention through a resident representative with almost plenary power and with tacit veto power when occasion arises, must not be lost sight of. He may suggest to the Cuban Government, or to the legislature, or the President of Cuba, what legislation is beneficial to Cuba. It is all done in the best of faith; it is all done for the benefit of Cuba. That raises the question if you can properly say that, as between the United States and Cuba, you are always for the United States first.

Now, as to the question of the advantages of reciprocity. I doubt whether you gentlemen, even if you have been in Cuba, realize the great demand for American products which exists in Cuba, and which one might almost say exists in no other country of its size and potential wealth. Cuba manufactures hardly anything. It purchases, not only manufactures in the United States, but it purchases vast quantities of food products in the United States.

When you arise in the morning, your pajamas, your slippers, the soap you use, the dentifrice, the brush, the sheets you slept on, the furniture—all is imported and is usually imported from the United States and has enjoyed the great benefit of the additional tariff allowance of 25 to 40 per cent.

As you go through your daily life in Cuba, all the eggs that you consume, the milk that comes in to the extent of $4,000,000 worth in a year in cans, the vegetables—in fact, everything that you use in the way of clothing, outward and inward, from hats to shoes comes from the United States.

And that is why the trade with Cuba is so very essential. That is why the gentlemen who have formed our committee are asking you please to consider, in connection with this tariff, not the question of the protection of a certain locality or one certain industry but to consider that the manufacturers, the exporters, and the merchants of this country have been doing an enormous trade, that they have debts due from Cuba which they hope to collect; and they hope that there will be such tariff legislation as not only to enable the Cuban people to pay their just indebtedness, but to make them good customers in the future.

There are millions of dollars invested in American enterprises there that seem to me to have the same right to protection. There is $1,000,000,000 of it as against $175,000,000 at the outside, in the beet industry. The question is whether this is going to be legislation for the greatest good to the greatest number of American citi-

zens, not only for those stockholders who have interests in Cuba to the extent of a billion dollars, but for those merchants and laborers who are manufacturing articles for export commerce to Cuba.

Then I come to the question of the farmer. Mr. Atkins has read to you a series of imports in 1920 representing farm products. It runs to the extent of about $100,000,000.

The farmer is very much of an exporter and business man so far as Cuba is concerned, because Cuba, outside of a little tobacco, produces nothing but sugar and has to buy her corn, her wheat, and her foodstuffs of all sorts—potatoes, canned goods, butter, eggs, meat and hog products—from us.

I do not speak as the representative of the farmer, but if the farmer in this country knew what is at stake, he and the other business men in this country would demand at once that Cuba should be so treated as not to be prevented from again becoming a valued customer of the United States.

Again, I insist, gentlemen, that you must not be swayed by the conditions of the moment, which are just as bad for one industry as they are for the other; and I beg of you not to place our decision upon the facts as they are presented at the moment with reference to the great over-plus and the smaller demand, but to look upon this tariff question in the broadest possible light, so that your decision will be not only a decision on the tariff question, but it will be a decision which involves a great principle—the principle as to whether, you might also say, quoting a Democratic candidate for the presidency who once was defeated, for saying the "Tariff is a local issue."

My hope is that you will decide to the effect that the tariff is not a local issue, and that the people who have investments in Cuba are under the protection of the United States, and not merely under a foreign government, as was suggested to-day with respect to Germany, an ex-enemy. They should be taken care of. That includes our producers, manufacturers, the farmers—yes, even the refiners, who have an investment of between four and five hundred million dollars, as against $175,000,000 invested in the beet industry. Even those companies are Americans, and their stockholders have equal rights with the stockholders of the gentlemen in the West.

Now, let me take up a question of comparison. We have passed an emergency tariff bill. We have given the American farmer, the producer of wheat, 25 cents a bushel at a time when the selling price was about $1.35, or about 20 per cent ad valorem. On an ad valorem basis the same emergency tariff bill, on a product that comes into the United States and is refined here, gives a profit and supports labor and another industry, imposes somewhere in the neighborhood of 80 per cent ad valorem. And the same bill, paragraph 506—and I am now speaking of the Fordney bill—provides: "Sugar candy and all confectionery not specially provided for, and on sugar after being refined, when tinctured, colored, or in any way adulterated, 30 per cent ad valorem." So we call attention to the inconsistency of a bill that provides for the raw product which is brought into the United States, and which gives a profit to the American industry, which gives a profit to the American workman, an 80 per cent ad valorem, while the finished, manufactured product, pays but 30 per cent ad valorem. The question

may be raised, just as it was raised in the House by the gentlemen who want as high a tariff as they can get, that this Government needs the money. Well, gentlemen, if this Government needs the money and it must have its income from one of the elements of the breakfast cup, perhaps the other elements of the breakfast cup should share that burden.

The tariff information surveys of the Tariff Commission, under the heading "Competitive conditions," state that "in all the regions in which domestic sugar is produced, except perhaps Louisiana, a considerable proportion is produced at a cost as low as, or lower than, the marginal Cuban cost. Such producers would be able to continue to compete with Cuba if there were no duty, although their profits would be less."

Again, the same authority says: "Taking the industry as a whole, roughly speaking about 20 per cent of the output is dependent upon the tariff."

The question of relative cost of production, gentlemen, as Senator Smoot pointed out, can not be arrived at by taking the enormously high cost of production of badly situated producing units, and comparing that cost with the low cost unit which is favorably situated on the other side. As he truly said, we have to take the law of averages, and you need not take my word as to the comparative necessity for protection. I beg of you not to take the word of these other gentlemen, who, as I said before, sharpen their pencils at both ends, and when they figure begin to figure back from the answer, as we did when we were in school, in order to find out by what method they are best served. Here is the information from the Tariff Board, and I assume that they are honest in their statements when they point out that only 20 per cent of the less favorably situated producers are dependent upon the tariff at all.

When the argument started to-day, emphasis was put upon the question of the refiners in connection with the beet industry. Testimony was read from the Hardwick committee. I think it was best stated by Mr. Thomas, who was the president or chairman of the board of the American Sugar Refining Co., as successor to Mr. Havemyer, when he said, "We went into the beet-sugar industry because that was the only way in which we could share the benefits of the protective tariff." They went into it further, of course, because they wanted to have a possible income from a source which might in the end wreck the entire operation of the refining units in the East.

If the prophecy of one of the high priests of the beet industry whom I see seated here and who once said, "If you give us only a moderate protection, within 10 years we will be exporting beet sugar to Germany," had been fulfilled, things would be different. Unfortunately, that prophecy has been as false a prophecy as the various prophecies of the gentlemen interested with regard to the absolute ruin of their industry.

Every time a question has come up as to whether a certain amount of sugar would come in at a lower rate of duty, as in the case of the negotiation of the reciprocity treaty, or as in the case of the islands which are now a part of the United States, their entire sugar crop, they were very certain, would be ruined; and you will hear to-day that they are going to be ruined once more.

The question was raised as to another provision of the Fordney bill hereby 25 per cent reduction should be allowed to certain American roducers of sugar if they imported a certain quantity of sugar, which ould be twice as much as they produced or refined from American roduction.

Mr. Atkins said that this, to his understanding, was a violation of e reciprocity treaty. I would like to say just one word in explana-on of that situation. It will be answered that if there be a rebate 25 per cent of the duty, the full duty being 2 cents, as proposed that bill, that means 1½ cents for the full duty paid sugars; and. y the same token, if Cuba pays $1.60 a reduction of 25 per cent in er case would mean $1.20, so that, making such a comparison as at, it may be argued that Cuba is not being discriminated against any way.

But, gentlemen, that is not how it will work. The situation now that the full duty paid sugar is sold on the basis of Cuban sugar, nd therefore the full duty paid sugar must absorb the difference etween the Cuban rates and the full rate. In other words, the efiner buys the sugar at a lesser price and then adds the full duty, r 2 cents, to it, and that sum total is not more than the Cuban ugar with $1.60 added to it. But the refiner gets a drawback and herefore the refiner, under these circumstances, will buy only the ull-duty sugar. He will not buy the Cuban sugar because he will et 2 cents a pound drawback for what he pays 1½ cents for. In he other case, he will get only $1.60 for which he paid $1.20. In ther words, it is not human for you to expect the refiner to give uba the advantage of this 25 per cent and therefore it is a violation f the spirit, if not the letter, of the reciprocity treaty between Cuba nd the United States.

I think you will find that the trend of argument will be that Cuba as brought upon herself her present situation and also upon her onfreres in the sugar business by having produced what appears o-day to be an unmarketable surplus.

I have touched upon this phase very little. Cuba, when she plants ane, can harvest for a number of years. She has planted nothing ince the evil days came upon the sugar market. That is not so in onnection with the beet industry. They knew that there was a urplus of sugar, but they hoped that that would be absorbed, and hey contracted in order to produce a larger crop under the present ircumstances than they have ever produced in their history. I merely mention this again to try to avoid the argument that Cuba alone is responsible for the evil days which have fallen upon the sugar market.

Another one of the charges against Cuba is speculation in 1920. About 20 per cent of the sugar crop of Cuba was sold, before grinding began, at prices varying between 6½ and 7½ cents a pound to Cana-dian, Australian, and European buyers. At the end of 1920 less than 10 per cent of the entire Cuban crop remained in the hands of the Cubans—about 350,000 tons maximum, as against 800,000 tons which were exported practically by behest of the American Gov-ernment from other countries.

Speculation in sugar, as was said by some one here to-day, was not brought about by Cubans alone; it was brought about by the fixation

of prices for Louisiana refined sugar long before the Cuban crop began. Everybody took advantage of it. Cuba should not b blamed.

Cuba is further charged with having such maladministration tha her present financial condition is brought about by her laxity an ignorance and the loss of her principal local banks through her ow fault and neglect. There may be something in it, but I wish to cal the attention of this committee to the fact that we have twice inter vened in Cuba. We have twice had the opportunity, which w exercised, of amending the laws, and we Americans did no bette than the Cubans in the establishment and the proper legal contr of banks and the banking system.

We are told, furthermore, that the present condition of Cuba, s far as her government finances are concerned, results from the fa that she lives beyond her income; that her budget is such that he income can not possibly meet her expenditures. In answer to tha gentlemen, I ask you what Government there is in the civilized worl to-day that is living within its income or within its budget? An the answer is, not even we, the people of the United States.

The question of Cuban deficits, and that she can not pay even he ordinary monthly pay roll until the end of the month, is one whic I think we ought to consider in connection with our own histor I think we ought to remember that in the history of this Govern ment, in the youth of this Republic, there was a time when there wa insufficient money to pay for the stationery of our Department o State. That was about the year 1816.

As far as banks are concerned, every student of American histor will remember the terrible, universal crash which occurred in th history of our own country after the revocation of the charter of th first bank of the United States.

We are also frequently reminded that Cubans are a bad lot; th they are always in trouble; that they have had frequent local dif culties. That is true, and so is it true, gentlemen, that the Unite States of America has gone through the same course of experienc We had Shay's rebellion. As a result of that, if my memory is not fault, one of our great statemen wrote a letter in which he said th he gloried in the virility of the spirit which resulted in that demo stration of interest in the affairs of our country, and he hoped th every once in a while there would be public spirit enough to cau another uprising. That was Thomas Jefferson.

Now, let us, in the consideration of this question, if you pleas remember that every sugar producer is to-day suffering as eve producer in every line is suffering, and that we hope to arrive a condition where we all may be prosperous, but we should not dri the Cuban producer into additional discredit and bankruptcy a force him, either to seek political annexation or to go to the despera measure of bankruptcy. Any competition which will give nobody chance of livelihood will be as destructive of the people who dema it as it will be destructive of the people who are required to ma this supreme sacrifice.

I ask the committee to consider in this measure before them only the present but the future, not only the question of the relati of the stockholders of the West, but also the stockholders of the E

he American stockholders of the investment in Cuba of a billion ollars, the trade of the United States, the good faith of the United tates to Cuba, which will have its echo in its relationship to trade with all the Spanish-American countries.

You have to sit as more than the Finance Committee in the decision of this question; you have to consider foreign relations, because Cuba is foreign, although our ward. You have to consider the interests of merchants and manufacturers, of investors in other parts of the country, and not the mere local question confined to a restricted territory in these United States.

I shall say in closing that in the last days of the life of Senator Hanna, whom I knew very well, he once said to me, "There was a time when I considered the wishes of my party and of my State of Ohio as paramount and supreme, and I acted accordingly. I have now, in the maturer, riper years of my experience, realizing the true duty of a United States Senator, come to the conclusion that I am the representative of the whole people of the United States and I must look upon every question that comes, not in the light of a member of the Republican Party, not as a representative only of the State of Ohio, but as a representative of the majority of the people and the majority interests."

I want to call your attention, finally, to the words expressed by Mr. Harding, when, at the beginning of this year, he opened up communication with the President of Cuba on the long-distance telephone between Habana and the mainland and expressed his uttermost sympathy with the dire distress and calamities which had fallen upon Cuba through the crashing of banks simultaneously with the evil condition of her main industry, and in which he promised her all the aid and support we could render. I hope, gentlemen, that with the Executive of this Nation reaching out the hand of help and sympathy, the Legislature of this Nation will not so decide as to deny that help, that aid, that sympathy, which was tendered by the President in that conversation with the then representative of the Cuban people.

Letter of R. E. Desvernine on Cuban Reciprocity.

New York, *December 22, 1921.*

Horatio S. Rubens,
Chairman American Committee on Cuban Emergency, New York City.

Dear Mr. Rubens: At your request I have considered the emergency tariff act and the proposed Fordney tariff act in their respective sections referring to Cuban products in the light of the historical and traditional policy of the United States toward Cuba, and take pleasure in giving you my opinion from such study that the emergency tariff act and the proposed Fordney tariff act in said sections constitute a reversal of the traditional policy of the United States toward Cuba and a breach of the clear and undoubted duty which the United States Government owes to Cuba.

The enactment of the emergency tariff act and the proposed Fordney tariff act is a clear departure from the commitments of the policy of reciprocity as established between the United States and Cuba and also practically a disavowal of the close political and commercial relationship between the United States and Cuba, as set forth from the beginning by leading statesmen.

On December 11, 1902, a treaty of commercial reciprocity was entered into between Cuba and the United States, Article VIII of this treaty reading as follows:

"Art. VIII. While this treaty is in force the rates of indebtedness which result for the importation into the United States from the Republic of Cuba by virtue of the rebates stipulated in this treaty are, and shall continue being, preferential over similar articles of merchandise from other countries; and in compensation of the said pref-

erential rights granted the Republic of Cuba by the United States it is agreed th the concessions made on the part of the Republic of Cuba to the products of the Uni States are also, and shall continue being, preferential over similar products of oth countries; it being understood that—while this treaty is in force—no sugar import from the Republic of Cuba and which is a product of the soil or of the industry of t Republic of Cuba shall be admitted into the United States with a reduction of dut of more than 20 per cent of those established by the tariff law of the United St approved July 24, 1897, and—while this treaty is in force—no sugar which is a pro uct of any other foreign country shall be admitted by treaty of 'convencion' in t United States with lesser duties than those imposed by the tariff law of the Unit States approved July 24, 1897."

It will be observed that this article stipulates that the reduction allowed to Cu shall not be extended to any other country and the proviso of said article establis that during the continuation of the treaty no Cuban sugar should be admitted to t United States at a rate of duty lower by more than 20 per cent than the duty imp by the tariff act of 1897, and no sugar from countries other than Cuba should be a mitted by treaty or covenants into the United States at a lower rate of duty than t provided by the act of 1897. This agreement has been in force continuously si 1903, except that the aforesaid proviso in Article VIII was abrogated by Section IV of the United States tariff act of 1913, at which time it was abrogated on the the that after May 1, 1916, sugars were to be admitted free into the United States, an now threatened abrogation by section 319 of the Fordney tariff act without a compensating consideration being suggested in its stead.

That the duty preferential on Cuban sugar will continue, even under the Ford tariff act, seems clear, as section 319 is a verbatim reproduction of Section IV-B the tariff act of 1913, in respect of which the Attorney General of the United Sta in his opinion of February 20, 1914, said:

"Clearly it was the intention of Congress as long as any tariff remained on sugar t continue the preferential to Cuban sugar. This was the spirit of the treaty and a of 1903, and the purpose of Section B-IV is to carry out that spirit."

Granting that the Congress of the United States has the constitutional power, a matter of internal legislation, to abrogate and repeal the aforesaid proviso of Artic VIII of the treaty of commercial reciprocity, let us consider, however, whether su an attempted repeal and abrogation is not a violation of international law, arising o of a breach of the reciprocity treaty with Cuba, and, as stated above, a radical chan in and reversal of the traditional policy of the United States toward Cuba.

That it is an express and direct violation of the letter of the treaty needs no suppor ing argument, as it by its very terms expressly abrogates and repeals same in th following phraseology:

"Except as to the proviso of Article VIII of said treaty, which proviso is here abrogated and repealed." (Extract of sec. 319.)

As to whether or not it violates and offends the "spirit" in which the treaty w conceived and the object which it was intended to serve, and also as to whether it a radical departure from the traditional policy of the United States toward Cuba, h been conclusively determined by the historical study hereinbefore made.

As early as January, 1901, a commission of Cuban planters and merchants came Washington and made representations to Congress respecting the improvement Cuban commerce, which, however, were not given adequate consideration by Congre at that time, because Congress was concerned strictly with the political aspect of t relations between the two countries. (57th Cong., 1st sess., H. Doc. No. 535, p. 40 Cuban overtures for a treaty of commercial reciprocity with the United States becam more insistent during the summer of 1901, and the provisional military governme which still controlled the island, supported the overtures of the Cubans. In fa the provisional military government even financed a campaign in the United Sta to inform the country "of the desires of the people of Cuba as to * * * trade re tions." (57th Cong., 1st sess., H. Doc. No. 679.) In December, 1901, another co mission of prominent Cubans petitioned the United States Senate for the enactme of a law which effected a reduction of 50 per cent from the Cuban tariff rates in retu for a reduction of similar amount on the American tariff on Cuban sugar and mola

President Roosevelt and his administration cordially reciprocated the demands the Cubans in this respect. In his annual report for 1901, Mr. Root, then Secreta of War, expressed emphatic approval of the policy of extending tariff concessio to Cuba. He declared that—

"Aside from the moral obligation to which we committed ourselves when we dr Spain out of Cuba, and aside from the ordinary considerations of commercial advanta involved in a reciprocity treaty, there are the weightiest reasons for an Americ

public policy rounding in the same direction, for the peace of Cuba is necessary to the peace of the United States; the indepencence of Cuba is necessary to the safety of the United States. The same considerations which led to the War with Spain now require that a commercial agreement be made under which Cuba can live. The condition of the sugar and tobacco industries in Cuba is already such that the earliest possible action by Congress upon this subject is desirable." (57th Cong., 1st sess., H. Rept. No. 1276, p. 1.)

President Roosevelt in his message to the Fifty-seventh Congress (57th Cong., S. Doc. No. 405, p. 1) said that the United States was "bound by every consideration of honor and expediency to pass commercial measures in the interest of her (Cuba's) well-being."

The United States Tariff Commission, according to its report made in December, 1918, pointed out that even at so early a date as 1901 the domestic beet-sugar and cane-sugar producers exerted what influence they could to prevent the granting of concessions upon Cuban products. Their efforts then failed because the United States Government regarded it as a superior duty and necessity to insure the economic stability of a free and prosperous Cuba. This issue was then met and decided, and its de novo consideration at this time, under unchanged conditions, seems inopportune.

In January, 1902, the question was again agitated, and it is significant to note that the Cuban side was presented in a communication from Military Governor Wood to Chairman Payne, of the Ways and Means Committee, in which it was pointed out that the planters had exhausted their resources and that a crisis was imminent. In the judgment of Gen. Wood, one of the foremost obstacles to the recovery of Cuban agriculture was the uphill competition with the bounty-fed sugar of Europe and the highly protected product of the United States. "Relief," he declared, "must be granted and granted quickly, or a condition will arise which will render the establishment and maintenance of a stable government highly improbable." (57th Cong., 1st sess., H. Doc. No. 535, pp. 648–649; also 57th Cong., 1st sess., Congressional Record, 35, 1902, p. 4629.)

While the bill was before Congress, the government of the island, on May 20, 1902, had been turned over to the Cuban people. Subsequently, on June 12 of the same year, President Palma cabled to President Roosevelt an earnest petition for legislative relief, before it was "too late and the country was financially ruined." (57th Cong., 1st sess., S. Doc. No. 405, pp. 1–3.) President Roosevelt immediately sent a special message to Congress, in which he again drew attention to the exceptional circumstances of the case:

"We expect Cuba to treat us on an exceptional footing politically and we should put her in the same position economically. * * * I ask that the Cubans be given all possible chances to use to the best advantage the freedom of which Americans have such a right to be proud and for which so many American lives have been sacrificed."

President Roosevelt, failing in obtaining the requested legislation, sought to attain the same ends by the negotiation of a treaty, which was ratified by the Senate of the United States on March 19.

President Roosevelt before the Fifty-eighth Congress declared in his message that the legislation requested was "demanded not only by our interest but by our honor," and he pointed out that the conditions under which the withdrawal of the American authorities from Cuba was agreed upon had brought Cuba into close political relations with the United States and it necessarily followed that Cuba must also, to a certain degree, become included within the lines of American economic policy.

The foregoing seems to conclusively establish that the "spirit" of the United States Government in which the treaty of commercial reciprocity was conceived and the objective sought to be obtained was one of preferring Cuba to all other nations of the world in commercial relations, because the stability of the Cuban Government is conditioned upon her economic prosperity and because the United States, by virtue of the existing political relationship, can not avoid its obligations to facilitate peculiarly the economic prosperity of Cuba. This, President Roosevelt has so aptly said, is a matter of national honor for the United States. This has been the unbroken policy of previous administrations of the United States Government, but it may be characterized particularly as the political testament of President Roosevelt respecting Cuba, the execution of which he has bequeathed to his successors.

In the debates before Congress the issue was always clearly defined, the opposition contending for the resultant damage to American interests and the supporters predicating their case on the moral duty of the United States toward Cuba, the political importance to the United States that the Cuban Government be sufficient to main-

tain law and order in the island, and the commercial advantages to the United States in the development of her foreign trade (U. S. Tariff Commission Report, Dec. 4, 1918, p. 320), "American interests" against "moral duty," and the political necessity of the stability of the Cuban Government. This is likewise the issue of to-day. Is it not of controlling importance that the United States Government has unequivocally and in most emphatic and unambiguous terms committed itself to this policy dictated by "moral duty" and required by political necessity? Has not the United States irrevocably committed itself to a decision of this issue and has not Cuba the right to rely upon the good faith of the United States? Even from the point of view of "American interests" the United States Tariff Commission says in its report of December 4, 1918, that "the imports into the United States from Cuba have reflected the influence of reciprocity in a less significant degree than have the exports from the United States to Cuba."

Though it might seem that the tariff act of 1913 was an attempt to modulate this spirit and policy, nevertheless it was interpreted otherwise by the Attorney General of the United States, who, in his opinion of February 20, 1914, said: "This was the spirit of the treaty and act of 1903, and the purpose of Section B–IV (tariff act of 1913) is to carry out that spirit." It is significant to note that the tariff act of 1913 ex- abrogated said proviso of Article VIII because sugar was to be admitted free into the United States after May 1, 1916 (38 Stat., 131; see also Atty. Gen. Op., Feb., 1914, infra), and under such circumstances the Attorney General was of course right in saying that "The purpose * * * is to carry out that spirit" as Cuba was ultimately to receive an even greater preferential by virtue of duty free sugar and the benefits of the proviso would automatically then become unnecessary. Now, when it is no longer a question of free entry of sugar into the United States, which then served as the excuse or consideration for the abrogation of the proviso of the treaty, the question has a different aspect, as the present section would seem to expressly eliminate and destroy Cuba's preferential without offering anything to compensate therefor or to mitigate the effects thereof.

For these reasons it is submitted that section 319 of the Fordney tariff act, as presently drafted, is an absolute change of the "spirit" of the commercial relations between the United States and Cuba and is a complete departure in the traditional policy of the United States toward Cuba. This is the first effort of a Congress of the United States in this direction, and it is inconceivable that the United States Government would change so radically and abruptly its policy of commercial reciprocity toward Cuba at this most critical moment in the economic and political life of that Republic.

The right of Cuba to commercial reciprocity with the United States is not singly predicated upon the treaty of commercial reciprocity, but would seem from the above quotations to be also founded upon immutable principles of moral duty and sacred honor. If the United States abrogates or repeals the treaty, which as a matter of internal legislation it might have the power to do, upon what new and different circumstances could this change in policy of commercial reciprocity to Cuba be predicated and justified when the reasons which occasioned its adoption exist to-day to a greater extent than ever before in the history of the Republic of Cuba?

All of the reasons advanced for the establishment of the treaty of reciprocity with Cuba may be urged with renewed vigor under the present critical conditions. In fact, they may be accentuated by the new and additional responsibility which the United States has to Cuba because of her request to Cuba to produce her maximum sugar production to assist and facilitate the United States Government and her allies in the World War, the efforts of Cuba in response to this request being to a great extent responsible for the present industrial and economic depression of that country.

It is true that a treaty is a bilateral agreement and can not be abrogated or repealed without the action of both parties, but there seems to be nothing to prevent the Government of the United States through congressional enactment, constitutionally and legally adopted, from violating the treaty of commercial reciprocity with Cuba. From the point of view of international law the effect of the adoption of section 319 of the Fordney Tariff Act would be a violation and breach of said treaty.

In conclusion the United States has irrevocably bound itself to foster to the greatest possible extent the commercial interests of Cuba and can not enact tariff legislation detrimental to Cuban interests without it being a serious breach of international law, a reversal of its traditional policy toward Cuba, and a breach of a clear and undoubted duty toward Cuba.

Respectfully submitted.

R. E. Des[illegible].

STATEMENT OF FREDERIC L. CRAYCRAFT, REPRESENTING THE AMERICAN STEEL CO. OF CUBA.

Senator McCumber. Mr. Craycraft, I notice that you represent the Pressed Steel Co. of Cuba. Has that anything to do with the sugar schedule?

Mr. Craycraft. I do not represent the Pressed Steel Car Co. but the American Steel Co. of Cuba, which has large interests which depend upon the welfare of the sugar producers of Cuba.

Senator McCumber. Your remarks will be directed to the sugar question, will they?

Mr. Craycraft. Yes, sir. I do not come before you to discuss technically the relative cost of production of sugar in the different countries. What I do wish to set forth is brought out in detail in tabulated statistics showing how the excessive duty on sugar, as provided in the Fordney bill, will react on the American farmer, the stock raiser, the dairyman, and the manufacturer.

In discussing the terms of the trade in millions of dollars, it does not go home to the ordinary individual. He does not see how it affects him unless you talk to him in terms of eggs, bacon, shoes, or whatever may be his particular industry.

Senator McCumber. The committee desires you to go on in your own way, because you have formulated in your own mind what you desire to present. The committee, however, can not emphasize too strongly the necessity for avoiding repetition of the same arguments on the same subject, and you will get a great deal more consideration if what you have to say is something new—new phases of the question and not duplicate testimony.

Mr. Craycraft. This is presented from a different viewpoint. People, I say, do not realize that Cuba is the largest purchaser of hogs, lard compounds, canned sausage, rice, potatoes, beans, onions, brass pipe and fittings, railway passenger cars, cement, calcium carbide, medicinal and pharmaceutical preparations, shoes, harness and saddles, and so on. Of the latter, more than 50 per cent of the total of our exports go to Cuba. She is also the largest purchaser of ready-mixed paints, fertilizer, twine, furniture of metal, glassware, roofing felt, engine and boiler parts, woven wire fencing, paper bags, cotton blankers and comforts, cotton cloths, etc. The total of these articles alone in 1920 amounted to over $140,000,000 of exports of American products to Cuba alone.

Cuba ranks second in the purchase of cattle, horses, mules, pickled pork, sausage other than canned, poultry, cheese, sweetened condensed milk, cocoa and prepared chocolate, corn, manufactures of asbestos, commercial automobiles and parts, railway freight cars, lubricating greases, automobile tires, electrical machinery, office furniture, railway car wheels and axles, locomotives, boiler tubes, pumps, builder's hardware, galvanized sheets, and so on. The total of these exports last year amounted to over $60,000,000.

Cuba ranks third in the purchase of hams and shoulders, miscellaneous canned meat products, hay, athletic and sporting goods, sulphuric acid, bicarbonate of soda, anthracite coal, wood and manufactures of wood, flour, structural iron and steel. The total of these items during the year 1920 amounted to over $53,000,000.

I have mentioned only a few of the principal commodities. Ther are many others which, for the sake of brevity, I have omitted.

Senator McCUMBER. What were the total importations from th United States to Cuba of all character of merchandise?

Senator WATSON. We sold $515,000,000 in 1920 and bough $720,000,000 from them.

Mr. CRAYCRAFT. That is correct. The difference in the balance trade, in round numbers, does not signify the importance of a cou try's purchasing power.

Senator McCUMBER. Will you give us her population? Of cour it would have a close relation to exports and imports.

Mr. CRAYCRAFT. Yes; Cuba has approximately two and a h millions of people. She has, I believe, per capita, the largest exp and import trade of any country in the world. I am not sure, bu think that is correct.

Senator McCUMBER. Certainly she has an exceedingly lar volume of trade for such a small country.

Mr. CRAYCRAFT. That is very true. That is a point that shou be carried home to the American producers.

So far the discussion has been as to how it is going to hurt Cu and American investments in Cuba. This shows another side of t question. It will show how it is going to hurt the American farm and, as I understand it, one of the principal objects of the increas duty is to protect agricultural products.

Another point to which I wish to call attention is that heretofo during prewar times, the American sugar industry prospered, t same as the Cuban industry, and the emergency tariff, when it w put in force a few months ago, was, from the viewpoint at that tin the best possible expedient, but world conditions were and still a in an unsettled condition. Values have not arrived at a prop basis; consequently, it is not an opportune time to arbitrarily esta lish a basis of duty on the differences existing to-day between t cost of sugar production in Cuba and in the United States, becau neither side to-day can tell exactly what it is going to cost wh things get back to normal, which they undoubtedly will within short time.

In view of this I would like respectfully to suggest that the sa rates which applied at the time the emergency tariff bill went in effect be continued. Both the United States and Cuba have bu up a prosperous trade relationship under a rate of duty which h apparently been satisfactory to both sides.

During 1920 the truck gardening and farm products alone th Cuba bought from the United States amounted to $85,000,000. live stock she bought $6,600,000. She is the second best purcha of the United States. She bought of dairy products alone, $15,000,0 She bought of meat products over $60,000,000. She bought of c ton and manufactures of cotton over $93,000,000. The last ite cotton cloths and its manufactures, is something which Cuba h never attempted to produce.

Senator McCUMBER. You have given some of the figures. All th you have given were for 1920?

Mr. CRAYCRAFT. 1920; yes, sir.

Senator McCUMBER. Is that the calendar or the fiscal year?

Mr. CRAYCRAFT. The calendar year. They are taken from statistics published by the American and Foreign Commerce and Navigation Bureau.

Senator McCUMBER. They have fallen off considerably since 1921 both as to exports and to imports.

Mr. CRAYCRAFT. They possibly have, as values of all commodities have decreased.

Senator SMOOT. And quantities too.

Mr. CRAYCRAFT. The items of farm products, live stock, dairy products, and meat products, which total nearly $170,000,000, Cuba can produce within her own borders if her sugar industry is seriously crippled.

On the item of cotton and manufactures of cotton, of which she buys $93,000,000, Cuba allows a preferential duty of 30 per cent instead of the average 20 per cent allowed on American sugar.

For the purpose of showing the specially protected market that Cuba offers for American products, I have segregated here the volume of importations of last year as showing the rate of preferential allowed by Cuba. Cuba allows to come in under the free list only $15,000,000 worth of American products, principally coal. She purchases under the 20 per cent differential $163,000,000; under the 25 per cent differential, $9,573,000; under the 25 to 30 per cent differential, she purchases over $78,000,000; on the 30 per cent differential she purchases $109,000,000; from the 30 to 40 per cent differential, she purchases over $22,000,000; at the 40 per cent differential she purchases over $10,000,000.

Should a country that shows results like this have her chief industry practically killed in order to afford temporary relief to a domestic product which supplies, I think, only about one-half of the total consumption of the United States? These are points which are bound to come home to the American producer. Cuba may be ruined. She may yet drift on our shores as a political and economic wreck on account of the excessive rates of duty applied on her sugar, but that is not going to help the American producer.

Gentlemen, I shall take up no more of your valuable time in discussing this question. The detailed tables in connection with this are all extracted and compiled from the publication of statistics issued by the Bureau of Foreign and Domestic Commerce.

Senator SMOOT. Do you want that printed in the record?

Mr. CRAYCRAFT. I have a brief that I would like to submit

Senator McCUMBER. The entire brief will be printed in addition to your remarks.

Mr. CRAYCRAFT. The statements made are not speculative opinions. they are actual facts which the American voter must analyze for himself, and by putting it not in dollars but in actual commodities he is in position to see how it affects his own particular interests.

Consequently, is it wise policy to increase the duty permanently six-tenths of a cent on the consumption of the United States of approximately 4,600,000 tons which would mean a tribute to be paid by the American consumer of $55,000,000 a year for the benefit of an industry of which, I believe, the acreage is less than one-half of 1 per cent of the general farm acreage in cultivation?

I thank you very much, gentlemen, for your attention.

BRIEF OF FREDERIC L. CRAYCRAFT, REPRESENTING THE AMERICAN STEEL CO. OF CUBA.

My presence before your committee is in representation of American industries which deal not only with the sugar industry but also with other industries which have been established and have prospered under the purchasing power of Cuba because of its sugar production. I respectfully ask on behalf of the company I represent and other American owned industries in Cuba, for the welfare of these industries for the continuance of a profitable and desirable market for the American farmers dairymen, stockraisers, and manufacturers, for the saving which will go to the American people by not increasing the cost to them of a prime necessity of life, for reasons of equity and fair dealing which Cuba is entitled to receive for her principal product in return for the protected market she offers to American industries, that your committee fix a rate on full duty sugar of 96° polarization of 1.256 cents per pound: and a rate on Cuban sugar of the same polarization not exceeding 1.0048 cents per pound or, if a higher rate for full-duty sugar is established, that a corresponding differential be granted to Cuban sugar so that the duty on Cuban sugar will not exceed 1.0048 cents per pound.

At the rate of 1.0048 cents a pound which was in effect for a period of eight years, the American sugar industry was able to develop along sound economic lines, proving that it had ample tariff protection at that rate and enabled Cuba to prosper and American industries to receive the full benefit of this prosperity as proved by the facts and figures given below. In determining the tariff to be placed on Cuban sugar it is important to consider in the first place the effect that such a tariff would have on American industries other than those allied to the sugar industries. In the second place, to arrive at an intelligent conclusion, it is necessary to consider the importance and value of the Cuban market for American products and the extent to which this valuable market will be closed or restricted through a reduction of the purchasing power of Cuba, because every increase in the tariff on Cuban sugar lessens the income of the Cuban producers. During 1919 and 1920 Cuba purchased from the United States as follows: Over $85,000,000 of truck gardening and farm products, over $6,600,000 of live stock, over $15,000,000 of dairy products, over $60,000,000 of meat products, over $63,000,000 of cotton cloths, and over $30,000,000 of manufactures of cotton.

From 1916 to 1920, inclusive, Cuba purchased from the American manufacturers of building materials, machinery, bridges, railway equipment (excepting rolling stock and agricultural machinery for use in the sugar industry in Cuba over $67,000,000. Between the period of 1911 and 1915, inclusive, Cuba purchased $19,000,000 of the same products. On these products Cuba only collected an 8 per cent ad valorem rate of duty. The marked difference in value between the first five-year period and the second five-year period in a great measure is attributable to the fact that in the erection of new mills American machineries and parts replaced the German, Belgian and other European productions. To show how closely allied the Cuban sugar industry is with American industries, it is interesting to note that Cuban purchases of commodities used directly in the sugar industry including bags from the United States in 1919 amounted to over $19,000,000 while similar purchases from all other countries were only $4,500,000. In 1920 the purchases from the United States of these same commodities amounted to $25,500,000, while from all other countries a little over $9,000,000. Considering the item of sugar bags alone, Cuba purchased in 1919 $8,892,722, of which $4,588,626 was purchased from United States. During 1920 the total purchases of bags amounted to $11,398,058, of which $2,699,999 was purchased from the United States. (See Cuban Government Sugar Industry Statistics for 1920, p. 98.)

Attached hereto is a statement showing principal commodities exported from the United States to Cuba; Cuba's rank as a purchaser of these American products, the respective protective differential reduction of duty granted by Cuba and the total exports of these same commodities from the United States to all countries. Of the total of the United States exports to Cuba during 1919 and 1920, amounting to $27[illegible]391,222 and $515,208,731, these commodities comprise a value of $214,956,121 and $409,380,326, respectively. This statement shows that Cuba's purchasing power and the benefits derived therefrom are not restricted to any narrow field of American industries, as for example, Cuba for 1920 ranks first in the purchase of hogs, lard compounds, canned sausage, rice, potatoes, beans, onions, brass pipe and fittings, railway passenger cars, cement, calcium carbide, medicinal and pharmaceutical preparations, shoes, harness, and saddles (more than 50 per cent of the total), ready mixed paints, fertilizer, twine, furniture of metal, glassware, roofing felt, engine and boiler parts, woven wire fencing, paper bags, cotton blankets and comforts, cotton

cloths, totaling approximately $139,595,022. Ranks second in the purchase of cattle, horses, mules, pickled pork, sausage other than canned, poultry, cheese, sweetened condensed milk, cocoa and prepared chocolate, corn, manufactures of asbestos, commercial automobiles and parts, railway freight cars, lubricating greases, automobile tires, electrical machinery, office furniture, railway car wheels and axles, locomotives, boiler tubes, pumps, builders' hardware, galvanized sheets, totaling $60,455,431. Ranks third in the purchase of hams and shoulders, miscellaneous canned meat products, hay, athletic and sporting goods, sulphuric acid, bicarbonate of soda, anthracite coal, wood and manufactures of wood, flour, structural iron and steel, totaling $53,769,792.

For the year 1919 Cuba was in most instances only one rank lower than 1920. With reference to other commodities in which rank is lower than third the volume of such commodities nevertheless remains around important figures, to wit:

Lard	$15,907,000
Bituminous coal	13,000,000
Passenger automobiles and parts	9,385,000

In comparing the trade balances between the two countries, aggregate amounts are apt to be misleading, because in the figures of imports into the United States from Cuba are included the sugar imported for refining for export, and this item in 1919 amounted to nearly 600,000 tons of a value approximately $72,000,000, which should be deducted when making comparisons. (See Tariff Information Surveys, par. 177, act 1913, p. 37.) Does your committee desire to close or restrict this important market for American industries, because it is an economic truth that any country must sell in order to buy and the ability of Cuba to continue to purchase from the United States depends on Cuba's ability to continue to sell its principal product to the United States in a volume controlled only by economic conditions? Any tariff legislation which discourages or reduces the production of sugar will affect immediately the purchasing power of Cuba and compel her to devise means to secure, as far as possible, a supply from within her borders, of those commodities which she is able to produce and forego the purchase of those she can not supply.

Our President's message to Congress at the present session states:

"We recognize the necessity of buying wherever we sell, and the permanency of trade lies in its acceptable exchanges. In our pursuits of markets we must give as well as receive. We can not sell to others who do not produce, nor can we buy unless we produce at home."

Before destroying the established basis of mutually beneficial exchange of products between the two countries, it will be well to consider the specific agricultural and industrial commodities of the United States, which the proposed tariff law will seriously affect, and which are not set forth in condensed statistical tables of trade balances. These commodities have been divided into four general groups.

First. Specific agricultural products which Cuba purchases from the United States, and which she can produce within her own borders, approximately $62,000,000. (United States Foreign Commerce and Navigation, 1920.)

Second. Specific agricultural products which Cuba does not produce in quantity but which she purchases in the United States on account of close trade relations, and in some cases on account of greater differential than the 20 per cent allowed by Cuba on products of the United States, approximately $24,000,000. (United States Foreign Commerce and Navigation, 1920.)

Third. Industrial products purchased from the United States for the sugar industry, approximately $25,000,000. (Cuban Government Sugar Industry Statistics, 1920.)

Fourth. General American agricultural, mineral, and industrial products which Cuba will not be in a position to buy as heretofore, if her economic status is seriously crippled by discriminating tariff rates on sugar, approximately $300,000,000.

In the discussion of any proposed tariff burden to be placed on the principal products of any country, equity demands, among other things, that consideration be given to the treatment which such country gives to products of the legislating country. Under this equitable principle Cuba is entitled to the most preferential consideration, because while the specific duty levied by the United States on Cuban sugar during the nine-year period from 1911 to 1919 was equivalent, when converted to ad valorem rate, to 35.5 per cent. (See Tariff Information Survey, par. 177, act 1913, p. 37.) Cuba during the same period only collected but an average of 13 per cent ad valorem duty on American products and protected them from foreign competition with differentials in duty ranging from 20 to 40 per cent. Furthermore, during the past 18 years, Cuba has levied a duty of only 8 per cent ad valorem on all building material, machinery, bridges, railway equipment, except rolling stock, and agricultural machinery

used in the production of sugar. Cuba's importations from the United States, grouping the commodities shown in the annexed statement under the several differential preferentials, are as follows:

Free list	$14,971,1[illegible]
20 per cent	163,116,079
25 per cent	9,573,014
25 per cent–30 per cent	78,622,700
30 per cent	109,878,642
30 per cent–40 per cent	22,838,491
40 per cent	10,380,229

From which it will be seen that more than $231,297,108 of commodities enjoyed protective differential ranging from 25 per cent to 40 per cent.

Cuba, unlike other countries, can not exercise the right of free selection of the markets or sources from which she can draw her requirements. She must either purchase them from the United States or else produce them within her borders. Cuba has been considered geographically, commercially, and economically a part of the United States. In the discussion of tariff legislation which affects her economic and commercial existence this close relationship should entitle her to receive the most favorable consideration.

The proposed tariff on sugar can not be justified, because it would increase the cost to the American people of a prime necessity of life in order to protect an American industry which professes its inability to exist unless artificially fostered and protected beyond sound economic principles.

Furthermore the proposed tariff on sugar is not essential to the protection of the industry in America as shown by the following extract from Tariff Information Survey, paragraph 177, act 1913, page 32:

"In all of the regions in which domestic sugar is produced, except perhaps Louisiana, a considerable proportion is produced at a cost as low as, or lower than, that of the marginal Cuban cost. Such producers would be able to continue to compete with Cuba if there were no duty, though their profits would be less.

"With every increase in duty a newer and higher margin is established for domestic producers, a greater proportion of the consumption will be domestically produced, and a less proportion imported from Cuba. The new domestic marginal producer simply 'breaks even,' the former marginal producer now makes a profit, and those who formerly produced at a cost lower than that of the marginal producer make a greater profit. The effect upon the revenues will depend upon whether the falling off in Cuban importations is or is not sufficient to offset the increased receipts from each unit imported."

To place the proposed tariff on Cuban sugar will mean a loss to Cuba which will immediately be reflected in her pruchasing power from the United States, compel her to develop within her own boundaries means to secure her requirements, thus greatly restricting the protected market American industries now enjoy; will increase the cost to the American people of a prime necessity of life, and can not be justified from an economic standpoint, because it would exact on the present value, approximately, a 64 per cent ad valorem duty on Cuban sugar when Cuba in return burdens American products with only an average ad valorem duty of 13 per cent and protects them from foreign competition with preferential differentials ranging from 20 per cent to 40 per cent.

protective differential reduction of duty granted by Cuba, and the total exports of these same commodities from the United States to all countries.

[Of the total of United States Exports to Cuba during 1919 and 1920, amounting to $278,391,222 and $515,208,731, these commodities comprise a value of $214,956,121 and $409,390,326, respectively. These statistics were taken from the Foreign Commerce and Navigation of the United States, 1920.]

PHILIPPINE SUGAR.

[Paragraph 501.]

TATEMENT OF HON. ISAURO GABALDON, RESIDENT COMMISSIONER FROM THE PHILIPPINES.

Mr. GABALDON. Mr. Chairman, I am in receipt of the following ablegram, through the Bureau of Insular Affairs, from Gov. Gen. eonard Wood, of the Philippine Islands, under date of December 12:

The Philippine Chamber of Commerce and the Chamber of Agriculture jointly quest that the present emergency tariff rate on sugar be made permanent in order to otect the sugar industry of the Philippine Islands. If Cuban sugar interests succeed lowering present rate, Philippine sugar would be totally driven from the American arkets. Competition is made impossible by difference in freight rates against the hilippines and other items highly favoring Cuban sugar.

RAMIREZ,
PRIETO,
Presidents.

In presenting this telegram, Mr. Chairman, I wish to state that I m fully aware of the peculiar status of the Philippines in such matters. While we are under the American sovereignty, we nevertheless ave our own tariff laws, and in some respects our situation is analoous to that of Cuba.

Like the Cubans we responded to the world appeal for increased gar production when the World War cut off the European source f supply, and as a result there are supplies on hand and in sight that an not be absorbed through the usual channels.

As we enjoy the American market on terms of equality with omestic producers, our people are naturally concerned over legisation that will threaten our likelihood of disposing of the sugar which e have produced under heavy and abnormal expense. The cost f laying our sugar down in the United States is greater than the ubans must pay, and we are under the further disadvantage that all uty-free sugars must bear because of the drawback regulations.

For these reasons, Mr. Chairman, and with no unfriendly feelings or the Cuban interests but solely in the interest of self-preservation, e respectfully urge that the present status be maintained.

PORTO RICAN SUGAR.

[Paragraph 501.]

TATEMENT OF PAUL J. CHRISTIAN, WASHINGTON, D. C., REPRESENTING THE PORTO RICAN SUGAR PRODUCERS.

Mr. CHRISTIAN. Mr. Chairman, the Resident Commissioner from orto Rico, Hon. Felix Cordova-Davila, who is present, has asked e to present a statement for the Porto Rican Sugar Producers' sociation, which I represent in Washington, and to request that Ir. Frank A. Dillingham, of 62 Cedar Street, New York, president f the South Porto Rico Sugar Co., be heard briefly regarding the st of producing sugar in the better class of centrals on the island.

Mr. T. Subirana, who arrived in Washington this morning from Porto ico, brought the latest revised figures regarding the crop from Mr. Ruiz-Soler, secretary of the Porto Rican Sugar Producers' Asso-

ciation, and a statistician of recognized standing. He states that the last crop, 1920–21, amounted to 491,000 tons (2,000 pounds), and his estimate for the current crop, 1921–22, is 446,000 tons, or 45,000 tons less than the last crop.

(The statement is as follows:)

On behalf of the Porto Rican Sugar Producers' Association we desire to submit the following facts with respect to the sugar industry of that island:

The crop for the current campaign of 1920–21 is estimated at practically 10 per cent less than that of 1919–20, which was placed by the United States Tariff Commission at 485,900 tons. That was slightly more than one-third of all the cane sugar produced in the United States and insular possessions; and was 22 per cent of the combined domestic-cane and beet-sugar crop, estimated at 2,147,818 tons.

Not only is Porto Rico, therefore, one of the important sources of our domestic supply of sugar, but the population of the island is entirely dependent upon agriculture, and sugar represents approximately 80 per cent of the value of the annual output of the soil.

Most of the crop is grown by small farmers and sold to the mills under the same system that prevails in the United States. In this respect conditions have not changed materially since the Department of Commerce in 1917 published the result of an investigation, which showed that 63 per cent of the crop was grown by "colonos" or farmers, and 37 per cent by the corporations that operate the mills.

Since the American occupation the crop has grown from 54,000 tons to 485,000 tons, and this development has been paralleled by an equally wonderful improvement in the condition of the people who produce it. When the Americans went to Porto Rico there were practically no schools. The great bulk of the population lived in the direst poverty, suffering from lack of nutrition and the ordinary necessities of life, and an official health survey showed that more than 90 per cent of the population was afflicted with pellagra or kindred diseases, due to the wretched condition of living. The daily wages on the plantations ranged from 21 to 30 cents.

To-day the sanitary situation is well in hand. A splendid system of public education prevails that will compare with any in the United States, and in many respects the same may be said regarding the improved standard of living. The report of the governor for 1920 shows that some of the field labor had received as high as $[illegible] for that year's crop, and practically none of the field hands were paid less than $1 a day.

Not only has the price of labor increased, but practically every operation that enters into the production of the crop has shown an increased cost. The nature of the Porto Rican soil makes drainage more difficult and necessary than on any of the other islands of the West Indies, and in addition to drainage a large part of her cane acreage has to be irrigated. Some of her fields have been in continuous use for more than 400 years, the cultivation of sugar cane having started in 1515, and her depleted soil calls for continuous and costly applications of commercial fertilizers.

In some respects Porto Rico suffers from more onerous conditions than any branch of the domestic sugar industry. In the matter of freight rates she is penalized by coastwise shipping laws, because she is domestic territory, whereas all of her competitors in the West Indies, and especially Cuba, enjoy the cheaper rates that result from the unrestricted competition of foreign ships. It developed in the course of the hearings yesterday that the beet factories of the Mountain States are compelled to pay a freight rate on that part of their product laid down in Chicago that is double the amount that the seaboard refiners pay on Cuban refined sugar shipped to Chicago from seaboard points.

Porto Rico suffers from this unjust freight discrimination on her entire output. Although she is domestic territory and this matter is entirely under the control of the Shipping Board she is compelled to pay practically 100 per cent more on her product to seaboard refining points than is charged the competitive foreign Cuban sugars for identical service.

Throughout the period of governmental sugar control that prevailed during the war a parity was maintained on ocean freights between all of the West Indian ports and seaboard refining points. As an illustration, the United States Shipping Board Emergency Fleet Corporation on December 16, 1918, issued its "official announcement covering rates and conditions governing shipments of sugar from the West Indies for the season 1918–19." The rates to New York or Philadelphia from northside Cuban ports ranged from 38½ to 43 cents, and from southside Cuban ports from 45½ to 53½ cents per hundred pounds. The rate from all Porto Rican ports was 40 cents.

Since the war there have been numerous readjustments of these sugar rates from all est India ports, but instead of a parity being maintained between Porto Rico and iba, the Cubans have secured a rate cheaper by 50 per cent almost than that allowed rto Rico. The rate from the domestic island to-day on full and broken cargoes is 27 nts a hundred pounds, while from northside Cuban ports it is only 14½ cents per indred pounds.

For more than two months we have been trying to equalize this condition in order at the new crop could be moved on equal terms with that of Cuba, but as yet our forts for relief have been in vain.

But this inequality in freight is by no means the principal discrimination made ainst Porto Rican sugar and in favor of Cuba. For years she has suffered from an tolerable condition which compelled her sugar to absorb much of the 20 per cent ncession allowed Cuban sugar, and the injustice of which could not be stated in tter language than was employed by the Cuban speakers themselves on yesterday, w that they are remotely threatened with the same treatment.

In protesting against paragraph 502 of the pending bill, by the terms of which all anufacturers of either cane or beets grown in the continental United States may iport for refining purposes at a reduction of 25 per cent of the duty, 2 pounds of reign sugar for each pound of output of the domestic article, all of the Cuban spokes-en contended that this would tend to lessen the value of their product by making less attractive for the refiners. Mr. Rubens, in a vehement protest for the Cubans, id:

"The situation now is that the full duty paid sugar is sold on the basis of Cuban gar, and therefore the full duty paid sugar must absorb the difference between the ban rates and the full rate. In other words, the refiner buys the sugar at a lesser ice and then adds the full duty, or 2 cents, to it, and that sum total is not more than e Cuban sugar with $1.60 added to it. But the refiner gets a drawback, and there-re the refiner, under these circumstances, will buy only the full-duty sugar. He ill not buy the Cuban sugar because he will get 2 cents a pound drawback for what e pays 1½ cents for. In the other case, he will get only $1.60 for which he paid $1.20. other words, it is not human for you to expect the refiner to give Cuba the advan-ge of this 25 per cent, and therefore it is a violation of the spirit, if not the letter, the reciprocity treaty between Cuba and the United States."

In the formal brief which they submitted the Cuban interests said:

"The practical operation of this paragraph, if made law, will be to reduce the ubans to absolute dependence upon the American refiners and manufacturers, and ill destroy sugar production as a separate industry, making it industrially sub-rvient to refiners.

To hamper Cuba through the proposed discrimination in sugar would mean having good neighbor in financial distress, unable to pay what is owed you, desperate and cking the proper means to live and prosper. And if you consider that this neighbor s a small country whose population derives singular credit for rendering the largest er capita amount of work in the world; a friendly nation whose past history is so terlocked, politically, geographically, and economically, with your own country, ou will understand why this Cuban mission has come to you full of hope and with bsolute confidence of getting the fair treatment we ask and expect and which at this me is so essential to the welfare and future development of our country."

If the Cubans can make such a plea, based on the comity that should prevail among ations, how much stronger must be the plea of the Porto Ricans, who are our own eople not against such treatment in the house of their friends, but in their father's ouse. And yet Porto Rico has been suffering from this injustice since the winter f 1915, when the discrimination against her sugars and in favor of Cuba was estab-shed by the refining trade.

This condition of affairs, which reduces the Porto Ricans "to absolute dependence n the American refiners," grows out of the existing statute and the Treasury regula-ons governing the payment of the drawback. Porto Rican sugars are sold at all sea-oard refining points in the same manner and in open competition with sugars from uba. As the Porto Rican product is on an equal footing with all other domestic sugars t follows that it should have the full benefit of the duty. But the practical effect of the rawback regulations has been to partly defeat the protective tariff, and instead of orto Rican sugar of equal grade being sold at a parity, it is habitually sacrificed at om one-sixteenth to one-half of a cent a pound below Cuban sugar. As a case in oint the New York Journal of Commerce of Wednesday, August 31, quoted the spot arket as follows: Cuban 96° centrifugals, duty paid, 4.86; Porto Rico 96° centrifugals, elivered, 4.50, a difference of 36 cents a hundred pounds in favor of the foreign sugar f identical quality, and yet by the terms of the emergency tariff law now in force this uban sugar paid a duty of 1.6 cents a pound. It is estimated that as a result of this

discrimination the value of the Porto Rican crop is annually penalized more th
$3,000,000.

The injury which the Cubans anticipate should paragraph 502 be enacted into la
differs only in degree from what Porto Rico has suffered for years, and inasmuch as th
matter has been forcibly brought to the attention of the committee the Porto Rica
industry respectfully submits the following observations on the general subject
the drawback on sugar.

The present regulations require the absolute identification of all material up
which a duty has been paid and a refund or drawback asked after reexportation
the finished article. Obviously this is impossible when both foreign and domest
raw sugars are melted together in the same kettle. The proportionate parts of ea
may be exactly computed but the identity of the individual grains at the end of th
refining process is lost, and because this identity can not be established the refiners
who are the only purchasers, claim that when they have export orders to fill Por
Rico sugar is handled at a loss. As has been explained, the refiners are the only pu
chasers, and because of the existing drawback regulations they compel Porto Ri
sugar to absorb a large fraction of the difference between domestic and Cuban suga
just as Mr. Rubens explained would happen as between Cuban and full-duty sug
if paragraph 502 was enacted into law.

At the time the present law was placed upon the statute book the export trade
refined sugar was negligible, only 23,113 tons being sent abroad during the year 191
But in the intervening years, with the dislocation of the European refining indus
as a result of the war, the export business has become very valuable. Last yea
amounted to 412,494 tons, and there is every indication that it will be an importa
factor in the refining trade for some years to come.

The growth of the export trade lends color to the explanation of the refiners for th
discrimination against Porto Rican sugar. They claim that if they have exp
orders or anticipate such orders they must, in order to secure the full drawback provid
by law, run their refineries from which such orders are to be filled wholly upon fore
dutiable sugar; that if at the same time they attempt to melt any proportion of d
mestic sugar, however small, the identity of the melting is thereby lost and they c
not longer obtain full drawback; also that after melting any domestic sugar they mu
in order to establish the right to secure the full drawback, shut down and clean o
every vestige of the domestic sugar at a great loss of time and at heavy expense.
a result, refining companies owning but one plant do not want domestic sugars if th
are working up export goods, while the larger companies operating several refineri
set apart one of the plants to handle the domestic crop.

The refiners illustrate the onerous working of the drawback regulations by th
concrete example:

"If a refinery melts in one week 10,000 tons of Cuban sugar and 5,000 tons of Po
Rican sugar, the drawback applicable to the Cuban sugar is approximately $20 a t
or $200,000. Under the present regulations this entire drawback can be recover
but to do so it is necessary to export the entire 15,000 tons. In other words, it
necessary to export domestic sugar in order to obtain the drawback on dutiable sug
Upon any less amount being exported, only two-thirds of $20 would be paid as dra
back upon the number of tons exported."

This explains the reason for Porto Rican sugar being sold at a discount. Until t
export trade developed they maintained a parity with Cuban sugar, but in Decemb
1915, the differential was established against them, and it has been maintained e
since. In order to equalize conditions the domestic producers have suggested t
following amendment be added to the drawback section of the tariff law:

"*Provided*, Where either refined sugar or sirup is produced from an admixture
dutiable and free or domestic raw sugars, drawback shall be paid on such expor
quantity as shall not exceed the proportion which has been ascertained, in accorda
with the regulations of the Treasury Department, to have been produced from
dutiable raw sugars used."

Reverting directly to paragraph 502, the Porto Rican industry wishes to go
record as opposing it. Aside from the questionable legality of such a provision,
so unfair to the domestic producers living beyond the limits of continental Uni
States that it is difficult to understand the policy that prompts it. It would furt
aggravate the present intolerable condition in which Porto Rican sugars find th
selves by broadening the market for foreign dutiable sugars at the expense of
domestic product, as the greatest profit would accrue in working up those duti
sugars for export so as to receive 99 per cent of the duty as drawback.

In the matter of cost of production it is always difficult to speak with accura
because of the wide range of conditions and efficiency that must be considered

The following information which was received from Porto Rico yesterday is as comprehensive with respect to the cost of the last crop as it is possible to obtain at this time. It reads:

"Information given by 16 centrals in Porto Rico show that the cost of producing sugar for 1921 averaged 5.04 cents per pound, and estimated costs for 1922 are 3.89 cents per pound. The general financial condition of the centrals is precarious, due to heavy losses sustained on the last crop and complete collapse in 1922 can only be avoided by maintaining an adequate duty."

The comparative cost of the previous crops can be stated with more accuracy.

The cost of production in the better class of Porto Rican factories during the period embracing the years 1913-14 and 1915 varied from 2½ to 3½ cents a pound landed in New York, and at the same factories for the years 1916, 1919, and 1920 the average cost was 6¼ cents, or practically double. During the same time a fair average for Cuba was 2 cents for the years 1913-1915 and 4 cents for the years 1918-1920.

In its last official announcement the United States Tariff Commission, under date of 1921, has given the following comparison between Porto Rico and Cuba of all cost reduced to a raw basis:

Prewar:		1918-19:	
Porto Rico	2.828	Porto Rico	5.802
Cuba	1.700	Cuba	4.104
Difference	1.128	Difference	1.698

Railroad freight rates on cane transported from field to factory have increased 44 per cent since 1915. Taxes have been practically doubled in the same period, and from official budgets and estimates of insular expenses no relief is in sight.

For these reasons we suggest that an effective tariff of 2 cents is necessary to equalize the high cost of production, the heavy increased ocean freight rate our sugar is compelled to absorb, and the differential which the refiners have established against Porto Rican sugar and in favor of Cuba by reason of the operation of the existing Treasury Regulations governing the drawback on sugar.

STATEMENT OF FRANK A. DILLINGHAM, PRESIDENT SOUTH PORTO RICO SUGAR CO., NEW YORK, N. Y.

Mr. DILLINGHAM. I will speak very briefly.

Mr. Chairman, the sugar industry in Porto Rico is the principal industry in the island, and the greater part of the wealth of the people is invested in that, either in the fields or in the factories. The production has increased since 1912 from 371,000 tons to 489,000 tons this year, being the same this year that it was in 1916 and 1917. In other words, during the war period there has been no substantial increase. There have been slight increases here and there, but no large increase in any part of the island.

The cost of making sugar has doubled in the last 10 years. Last year's figures, from 16 factories that produced about 50 per cent of the output of the island, varied in cents per pound from 4½ to 5¾, an average of 5.03 cents per pound.

Three other factories producing 100,000 tons averaged the same, but do not give definite figures for each factory. That gives a cost of 5 cents a pound for three-fourths of the island's production last year, and that is undoubtedly correct; that is, the crop that ended last July.

For this coming year such factories as have been able to make estimates give figures running from 3.5 to 4.6 cents, an average, f. o. b. Porto Rico, of 3.89 cents per pound.

Senator SMOOT. That is 96 per cent raw sugar?

Mr. DILLINGHAM. That is 96 per cent raw sugar.

Senator MCLEAN. Why does it cost twice as much to produce in Porto Rico as it does in Cuba?

Mr. DILLINGHAM. Porto Rico has no virgin land; it is land that has been in cultivation for a great many years and needs fertilizing and cultivation, as is done in a garden here. In other words, it is more like Hawaii than like Cuba. We have no land that will produce crops year after year without replanting and cultivation. We have to plant every year ordinarily, and at least every two years on the average; some lands give a crop for three years, but very few; land has to be irrigated on the south coast, fertilized, and cultivated by instruments or by hand, which is not done in Cuba and Santo Domingo to any large extent.

This sugar that will cost 3.89 cents f.·o. b., must be transported to New York at a cost perhaps the same as last year, a little over 20 cents per 100 pounds and the expenses of bringing it to the coast and landing it in New York will make the total cost c. i. f. New York, between 4 and 4½ cents.

I do not think it is possible for the island as a whole to do as well as that. I think that when our season is over we will find we have been a little hopeful about reducing costs. So far they have been reduced materially, but there are some things that can not be further reduced. The cost of cane has risen, and, on account of increases in the cost of labor and supplies, it is not going back as fast as it came up. I doubt if we ever get back to prewar costs. The net result is that we need, in order to sell in competition with Cuba, "delivered in New York" price of 2 cents is reasonable, as I believe it to be, another 2 cents effective duty, in order to break even in Porto Rico.

(Mr. Dillingham submitted the following statements:)

Cost of production of sugar in Porto Rico, season of 1920–21.

Centrals.	Cost per 100 pounds.	Centrals.	Cost per 100 pounds.
Guanica	$4.96	Columbia	$5.8[illegible]
Cambalache	4.5612	Los Canos	4.3[illegible]
San Vicente	4.6847	Central Defensa	6.67
Plazuela	3.75	Sta Isabel Sugar	5.17
Juanita	4.58	Antonio Roig	5.[illegible]

Mercedita, Ponce	5.4838	Central Victoria	4.545
Vannina	5.051		
Carmen	4.7512	Average	5.0[illegible]

Estimated cost of sugar in Porto Rico for the years 1921–1923.

Centrals.	Cost per 100 pounds.	Centrals.	Cost per 100 pounds.
Guanica	$4.00	Central Defensa	$4.[illegible]
San Vicente	4.00	Sta Isabel Sugar	3.[illegible]
Plazuela	3.32	Juncos Central	3.[illegible]
Mercedita, Ponce	3.712	Aguirre	4.0[illegible]
Columbia	4.25	Fajardo	4.[illegible]
Los Canos	3.89		

Average, based on 1921 production, $3.89.

BEET SUGAR.

[Paragraph 501.]

ATEMENT OF FRANCIS KING CAREY, BALTIMORE, MD., PRESIDENT NATIONAL SUGAR MANUFACTURING CO., SUGAR CITY, COLO.

Mr. CAREY. Mr. Chairman and gentlemen of the committee, quite nexpectedly I have been asked to sing the first hymn at the opening f the beet-sugar services before your honorable committee. I will nly sing one verse of it, and will try to make that a brief one, because will be followed by gentlemen who represent interests vastly larger han my own, and who can speak with larger expert experience of he agricultural and manufacturing subjects about which you will e glad to be advised:

I am the president and controlling owner of the National Sugar fanufacturing Co., which operates a small but entirely independent eet-sugar plant at Sugar City, in Crowley County, Colo., with a ated slicing capacity of 600 tons of beets a day. If the great Republican Secretary of Agriculture, the late James Wilson, were still live I might almost be tempted to hold him responsible for some of ny losses in the beet-sugar business, because the Sugar City plant was eally a child of the splendid propaganda for which Mr. Wilson was argely responsible, in the interest of the development of the arid ands of the Mountain States which could be brought into cultivation y irrigation. I think it was largely due to the Department of Agriculture that alfalfa was made one of the valuable crops of this region; ut artificial irrigation makes land expensive, and Mr. Wilson sought for an intensive crop which could be made highly profitable and which would add to the productivity of the soil for grain and other crops, and his clear mind, backed by his indomitable energy and enthusiasm, led many people, including those who established the plant at Sugar City, to invest enormous sums of money in establishing the beet-sugar industry in the United States. Speaking seriously, I think it is fair to say that the beet-sugar business in the United States is distinctly the creation of Government propaganda, conceived in the interest of the people of the United States at large.

When the construction of our plant at Sugar City was begun 21 years ago its surrounding territory gave life only to coyotes, antelope, prairie dogs, and lean kine. The soil had never been upturned, and, if I may use the jocular expression of the West, it was a barren prairie on which "the hand of man had never set foot." The men who backed this plant went 10,000 feet above tidewater near Leadville and built a great dam in front of the Twin Lakes where we now impound over 53,000 acre-feet of water and bring it 200 miles—as far as from Baltimore to New York—to aid in the irrigation of 56,000 acres of irrigated land, of which now in the neighborhood of 42,000 acres are being successfully cultivated with alfalfa, sugar beets, canteloupe, wheat, corn, beans, apples, cherries, and, indeed, practically all other farm products. From absolutely wilderness conditions the construction of our beet sugar plant has built up the bright little town of Sugar City, with a population in and tributory to it of about 2,000 people, with a snappy little newspaper, a sound little

bank, two hotels, a little theater, five churches offering five differen ways of climbing the "golden stairs," and public school building which would do credit to an eastern town of 20,000 people. Th primary school building cost about $70,000, and the new high schoo building cost over $120,000. At Sugar City alone 600 children ar enrolled, and in the adjoining towns of Ordway and Crowley, wil similar high-class school buildings, as many more. A boy or gi graduating at the Sugar City high school can pass without furthe examination into college life. Under the consolidated school syste which prevails in Colorado "the little brick schoolhouse" with it underpaid and undertrained teacher is not known. From the beau tiful school buildings at Sugar City, which are models of ventilatio light, and equipment, gasoline omnibuses proceed each morning int the country districts and bring the farmer's child to school, returnin him in the afternoon. Our company is the largest taxpayer in Crowle County, and the taxes we pay—between $30,000 and $40,000—fu nish a large part of its total receipts. It is possible that the Missou Pacific Railroad pays larger taxes. Within the last two years i has completed a really beautiful up-to-date railway station at Suga City at a cost of about $60,000 at which all the transcontinenta trains stop, in both directions.

Senator WATSON. In what year was your plant built?

Mr. CAREY. In 1901. Some years ago, Mr. Chairman, I said, i speaking before a committee of Congress, that I thought it was rea sonably probable that if our American friends who have invested thei money in Cuba succeeded in stopping the flywheel of our great Corlis engine, and in silencing the whistle which called our highly traine labor organization to its work, the schoolteachers of Crowley Count the 1,200 children who are getting their education as America citizens, the farmers who are profiting by the growth of sugar beet the little banker, the little newspaper editor, the storekeepers an the day laborers, like John Brown, "Osawatomie Brown," would b "bound to give you trouble" if you nail their coffin down.

At this point, Mr. Chairman, I refuse to be misunderstood. M sense of humor is sufficiently well developed to prevent me fro assuming for a moment that either the members of this committe or any other Members of the Congress, are interested in "hard-lu stories" about losses in business. We are not, therefore, seekin shoulders on which to shed our tears, because we know that busine men everywhere have suffered great losses and have no tears t spare for other people. Hard-luck stories to-day remind one of th game of golf. If you start to tell a golfer what experience you ha at the seventeenth hole of a particular golf course, he will not pay th slightest attention to a single word you are saying, but as soon as h can break in he will tell you his experience at the tenth hole.

Senator McCUMBER. None of the members of this committee, M Carey, know anything about the game of golf and don't understan the meaning of your simile. [Laughter.]

Senator SMOOT. None of the members of this committee are o enough to play golf yet. [Laughter.]

Mr. CAREY. In view of the executive interest in golf, Senator think this committee might take judicial notice of the game. suggest, however, that if you don't play golf, you will never b President of the United States. I might add that, from my person

experience with presidential golfers, you don't have to know much about the game to become President. [Laughter.]

Of course, the real question before this committee is not whether this or that company, or this or that stockholder, has lost his money in the beet-sugar business; but whether the beet-sugar business is worth preserving; whether it is really approaching the valley of the shadow of death, and whether, assuming the truth of the first two assumptions, it would not be wise for the Congress of the United States to take any reasonable steps that are necessary, solely in the public interest, to preserve it. The logic of the situation can be simply stated in the proposition which the beet-sugar industry hopes to establish by argument and testimony as follows:

PROPOSITION.

1. Because of the industrial importance of the beet-sugar industry to the people of the United States in the employment of labor; the support of agriculture, including the payment to the American farmer of an adequate price for an important product of the soil, and because of the protection which the beet sugar supply gives to the required sugar supply of the United States, it would be against the public interest that the Congress should take any step which would imperil the continuance of beet-sugar manufacture, or omit to take any step which is reasonably required for its preservation.

2. The cost of manufacturing beet sugar at the present time, with efficiency of operation and the use of all known chemical and mechanical economies, is so far affected by the high cost of American labor which is thought necessary to maintain American standards of life that beet sugar can not at present compete with cane-granulated sugar refined from raw sugar produced in countries where a very much lower cost of labor prevails, because a very much lower standard of life for the laborer is thought sufficient, and because of this fact, added to the very large overproduction of sugar in Cuba, the American beet-sugar industry is threatened with virtual extinction during the coming year.

3. Public interest, therefore, demands the imposition by the Congress of a duty on imported raw sugar, which will enable the American beet-sugar industry to continue to perform its valuable industrial functions; and for that purpose the import duty must be made high enough to equalize the cost of producing the imported raw sugar, plus freight and refining cost, with the average cost of manufacture of standard granulated sugar by the beet-sugar plants of the United States.

Now, let me speak briefly on the major premise of this proposition: Is the beet-sugar industry, from a public standpoint, worth preserving?

A few striking statistics relating to the magnitude of the beet-sugar industry will be interesting. It manufactures annually about 1,000,000 tons of granulated sugar—or say, 20,000,000 bags—and at the present approximate average cost of manufacture, we start with an annual operating outlay, including the payment of wages of labor, price of beets to farmers, and cost of supplies, of over $100,000,000. There are 95 beet-sugar plants now constructed in the United States, in 17 separate States which have a total daily slicing capacity—a capacity which is in a great number of cases largely exceeded—of 105,950 tons. It is fair to estimate that the total replacement cost of these plants, including warehouses, beet sheds, beet dumps, pulp drying plants, pulp silos, feed yards, trackage, factory water supply, etc., is between $175,000,000 and $200,000,000, so that a reasonably conservative estimate of the total plant value and annual operating disbursements would not fall far short of $300,000,000. The total acres of beets grown in the United States in 1921 was 880,000 acres. It goes without saying that the withdrawal of that huge number of

acres from beet-sugar culture, and their application to the growth of other crops, is not a matter to be lightly thought of. Over 100,000 farmers, employing about 85,000 laborers are engaged in the beet industry. The factories themselves employ at high wages over 35,000 men, which by the way is in striking contrast to the number of men employed in the refining of cane sugar in this country, which, as is known, is a process of manipulation and not a process of manufacture.

It is not possible to overstate the importance to the people of the United States of the fact that the beet-sugar industry produces at a reasonable cost, within the political borders of continental United States, practically 1,000,000 tons of the finest and purest standard granulated sugar made in the civilized world, which is not only safe from the closure of the high seas by war from the outside, but is to such an extent manufactured at inland points that it is safe even from a temporary invasion of our shores by an enemy country. But it has a far higher value in times of peace than that arising from war conditions. If a nation like the United States can manufacture from its own raw material—i. e., from beets grown within its border—nearly one-fourth of its own consumption (increased to about one-half of its consumption by American-grown cane and cane sugar coming from its insular possessions), it has a great factor of safety in keeping down the price of sugar to its people; if it is threatened by some great sugar source, like the island of Cuba, with an attempt to hold back and speculate with its sugar supply. It will not be forgotten in this connection that this source of supply may be, as in the case of the island of Cuba, a country over which the laws of the United States have no control. At the close of the late war the price of granulated sugar in the United States rose to the preposterous figure of between 25 and 35 cents a pound, based on the speculative price of raw sugar which was established in Cuba, but it will be remembered that this rise did not and could not take place until the beet-sugar supply was practically exhausted. In 1920, during which year Cuban raw sold at 23 cents a pound, refined beet granulated at the plant sold at an average of less than 12 cents a pound. Our company received for its entire 1919–20 product an average of less than $10.50 a bag of 100 pounds. We were formally offered $18 a bag for our entire output. If we had felt at liberty to accept this offer, it is quite needless to say that we would now be "making faces" at our banks.

While it is not intended to make any invidious comparisons between the patriotism and generosity of the beet-sugar industry and other great industries which bent their backs to help win the war, Mr. Hoover has publicly justified the pride of the beet-sugar industry in the fact that it was the first great American industry voluntarily to submit its operations to the control of the Food Administrator. I quote from Mr. Hoover's official statement in the New York Times of August 27, 1917:

> The beet-sugar producers of the country have patriotically agreed with the Food Administration to limit the price of their sugar to a basis which should result in a reduction of about 1½ cents a pound from the present price, effecting a saving of $30,000,000 to the consuming public between now and the first of next year. * * * This patriotic action of the domestic beet-sugar industry in acting as a control over the price demanded for imported sugar will not only make the saving mentioned above between now and the end of the year, but will contribute largely to establish a lower price for imported sugar throughout next year.

If this "patriotic action" saved the American sugar consumer $30,000,000 in a few months of 1917, to what huge proportions must that saving have gone in 1918 and 1919, during which years the beet-sugar supply aided in keeping down the price of all sugar consumed in the United States, and in 1920 when what Mr. Lowry has well called "the sugar debauch," which was brought on by the folly of American capital invested in Cuba, drove the price of refined sugar to the consumer to over 30 cents a pound? The members of this committee will think long and carefully before they permit the conspiracy to destroy the beet-sugar industry of the United States to reach its goal, when they contemplate the fact that in a short space of three and a half years the beet-sugar industry probably saved the people of the United States over $250,000,000.

Senator SMOOT. Mr. Carey, as you are familiar with the conditions in Colorado, will you tell the committee what you know about the employment of children in the beet fields?

Mr. CAREY. Senator, the introduction of this subject has taken me by surprise and I am not prepared to give actual statistics, but I am intimately familiar with the subject in connection with the operations of our own plant and I have a sufficient familiarity with it throughout Colorado, so I can speak with confidence. In the first place I do not believe for a moment that the industry resents in any way the cooperation of anybody, official or otherwise, in helping it to solve the human problems which are necessarily involved in operations so intimately connected with community life. I might feel at liberty to suggest that philanthropists and uplifters, for whom I have the highest respect, sometimes make the mistake, from a natural human desire to pursue their work in a dramatic way, of conducting their investigations outside of instead of in cooperation with the welfare department of the manufacturing industry which is doing its best to promote humane conditions. But this is the first instance in my knowledge of a Government department permitting the attorney of a selfish interest to drag from its pigeonhole a report which had been long forgotten and give its photographs to this attorney to be used in wicked and malicious propaganda which is against the interest of the child itself.

Now, what are the facts in regard to the employment of children in the beet field? But few companies raise any beets themselves. They get them through contracts with individual farmers. For example, out of a beet acreage of over 6,000 acres, our company planted itself only 43 acres; and those only for experimental purposes to test beet seed, fertilization, and methods of irrigation. It follows, therefore, that the sugar company has practically no control over the kind or character of labor which the farmer employs to bunch and thin his beets in the spring and to top them in the fall, these being the only two operations in which children are to any extent employed.

It is true that the company can exercise some moral influence over the farmer and the farmer's wife in encouraging them to protect the younger children and in insuring them their education; and the compulsory school attendance law of Colorado is an aid to the sugar company in exercising this moral influence, because it is true of Colorado as well as of all other enlightened communities that family standards can best be raised through the child itself at the public school. The standard set for the child by its

school-teachers finds its reflex in the growing pride of parents in the child. A consolidated public school, like the primary and high schools of Sugar City, is the community center around which all kinds and classes of the community revolve; because it knows no race, no politics, and no special religious belief. The fact is, of course, that it is the natural temptation of all beet growers, who have not become too much Americanized, to put "the whole family" in the field during the bunching and thinning period of about three weeks in the late spring, and during the topping period of about three weeks in the early fall. Both of these operations, while highly profitable, involve but little physical effort. In my county they are conducted in the green fields under the amethyst blue skies and in the cool white sunshine of a wonderful climate. If the distinguished attorney who said he spoke for the New York and Canadian bankers, who are now threatening to liquify their frozen credits by throwing their collateral sugar on the American market at a cent a pound, had felt disposed to shed his crocodile tears over the children of the east side of New York, whose sweatshop parents are destroying their progeny in the stifling rooms of sordid New York tenement houses, he would at least have had some foundation for his simulated grief. But I am glad he brought the subject up because he has very unwisely attacked the beet-sugar industry in its strongest intrenchment.

No fair man will deny that it is the great glory of the beet-sugar business that it is a notable builder of civilization, and that everywhere it plants its feet flowers of community advancement bloom. The beet-sugar business touches nothing which it does not improve. It improves the soil; it increases the output of other crops; it raises the wages of labor; it raises the standards of home life; it increases the self respect of every member of the family, and it is by the raising of the family standards that the problem of child welfare is soonest solved. Every builder of civilization has to deal with family conditions which are difficult because from previous want of education, or from previous want of association with American standards of life, the family unit—Russian, Mexican, Slav, and the like—makes resistance to the most enlightened work of the most enlightened industrial movement; and it takes patience and tact to advance even slowly. I can say on my own authority and from my own observation that no child of any age comes into Crowley County without being benefited. They often come undernourished, anemic, with crooked spines and with all the other evidences of parental neglect, due to poor home surroundings. First of all the school takes hold of them. The parents see the standards which the residents of the county maintain. The children themselves develop a self-consciousness, and the mother love will do the rest. As for the published report itself, with its so-called startling statistics, no one who is interested in the education of the child, and who has taken any part in the new movements for his vocational training, will be misled by these so-called startling statistics. Surveys of the public schools of our largest and most prosperous cities give like "startling statistics." I have recently read such a survey which indicates that the teeth of nearly 70 per cent of the public school children of a large city had been hopelessly neglected. I have read another survey of the same character which would seem to prove that almost the same

roportion of public school children have crooked limbs or spines. nd the last survey I read indicates that almost an equal proportion re undernourished, largely because of the absence of milk for their ood. All of these reports have their value, even if they do sometimes prove too much; because they serve to call attention to abuses nd suggest methods for their remedy.

Senator McCUMBER. Don't you think the child growing up will ecome a better citizen if he is compelled to work part of the time? think we are spoiling the children of the present generation. Soon e will be producing children that can not walk. We send for them nd take them to school in automobiles and take them back from chool to their homes. Work is what they need to make them good itizens. Don't you think that is true?

Mr. CAREY. I suppose it is, Senator; but I would qualify your tatement by saying that, in my opinion, every child is entitled by ight in America to a public-school education up at least to the eventh grade; and if the parent tries to capitalize the child in such way as to deprive him of this modicum of education I think the tate ought to step in and force his hands. The superintendent of ublic instruction at Sugar City understands perfectly, and acts upon he understanding, what my views are as president of my company; hat where the interest of the sugar company and the interest of the hild conflict the child is to have the right of way.

Senator McCUMBER. There is growing up a sort of idea that the hild should not work until he is 16 years of age. If he has not earned to work by that time, I am afraid he will never learn.

Mr. CAREY. Of course, that is true to a great extent. You will never persuade the farmer that his 12-year-old child should not milk the cow and do housework, and I don't suppose it is desirable that he should be so persuaded. The question of the use of children in the beet field resolves itself into the question as to how they should be employed and how long they should be employed each day. It is an easy job, a very profitable one and is almost always done under the direct supervision of the parents of the child.

More competent speakers than I will follow me who will tell in detail the history of the relations of Cuba to the United States so far as these relations bear upon the beet-sugar industry and will also advise you of the exact present conditions of these relations. But in closing my argument perhaps you will permit me to refer briefly to the claim which Mr. Atkins and other representatives of American capital invested in Cuba have advanced that this American capital was equally entitled to protection as the capital invested in the American industry. As Mr. Atkins is a Bostonian he will not charge me with the use of "high-brow language" when I suggest to him that his claim involves the fallacy of the undistributed middle. Of course, the American capitalist is entitled to the protection of its Government in foreign countries; but this right is surely subject to this limitation: When American capital is employed in a foreign country in such a way as to prejudice the best interests of the people of the United States, it can not to that extent expect protection. To show the fallacy of the argument, let it be assumed that there was an island, which we will call Island A, which permitted human slavery—not near human slavery but actual slave ownership. It goes without saying that American capital could make sugar in

Island A and ship it to the United States at a price which it would be impossible for American labor, controlled by American standards of life, to compete with. If permitted by law, this process would put the American sugar industry to sleep, and put the American sugar consumer in such a position that Island A could dictate to the 100,000,000 people of the United States exactly what price they paid for sugar.

Now, no one will deny that the relations between Cuba and the United States present this condition only in a slightly modified form. The fact that a great agricultural country like Cuba has to import from the United States its milk and eggs is a fairly good indication that the "home," as we Americans understand it, hardly exists in Cuba. The American home is an expensive proposition. It means a little automobile for the farmer; it means running water in the house and a victrola for the wife; it means decent clothes for the whole family; it means taxes for education; it means contributions to churches, and amusements; it means a bit of travel now and then; and it means the ambition of the parents for the children that they shall have their education and equal opportunity to advance in the world as far as any other citizen of the United States. One does not find it necessary to exaggerate labor conditions in Cuba to show the contrast. It seems to be conceded, for instance, that labor in Cuba is now receiving about 60 cents a day, paid in store supplies at retail prices. Can you imagine an American farmer submitting himself to that humiliation? Mr. Atkins has forgotten, moreover, that American capital invested in Cuba is responsible for the debauch which has brought Cuba to its present pass. No one can claim that the beet-sugar industry has the slightest responsibility for the present oversupply in Cuba, and it would be utterly unfair to make the beet-sugar industry pay for the blunder. While Cuba has been increasing her output about 60 per cent, the beet-sugar industry in the same period has only increased its output by about 8 per cent.

I believe I have made it reasonably clear to your committee that the beet-sugar industry, through no fault of its own, is seriously threatened with conditions which no financial prudence and no extent of credit can meet without the assistance of the Congress of the United States. The Congress controls the first line of defense, against which the banker, with his frozen credits; the American capitalist in Cuba, who is the victim of his own folly; and the refining interests of the United States, which view with alarm the rising dignity of the beet-sugar business, are marshaling all their forces, with a combined purpose of putting the beet-sugar industry out of business.

I respectfully ask your committee, so far as it lies within your power, to say to this army of destruction, as the brave French Army, with its back against the wall, at Verdun said to the onrushing German legions: "Ils ne passeront pas!"—"They shall not pass!"

STATEMENT OF W. D. LIPPITT, DENVER, COLO., GENERAL MANAGER OF THE GREAT WESTERN SUGAR CO.

Mr. Lippitt. On behalf of the domestic beet-sugar industry, I should like to submit to your committee a brief memorandum relating particularly to certain agricultural features of the industry.

At the present time sugar beets are being grown in 17 States in this country, ranging from California on the west to Ohio on the east. The sugar-beet territory may be roughly divided into three major groups, i. e., the Pacific coast area, comprising California, Washington, and Nevada, served by 18 sugar factories; the Rocky Mountain area, comprising Utah, Idaho, Montana, Colorado, Wyoming, Kansas, and Nebraska, served by 55 factories; and the eastern area, comprising Minnesota, Iowa, Wisconsin, Michigan, Illinois, Indiana, and Ohio, served by 33 factories.

During the season of 1921 approximately 800,000 acres of sugar beets were grown in the United States, from which were harvested 7,500,000 tons of beets, an average yield of about 9½ tons per acre. The current season's yield per acre was slightly below the normal average for the country of above 10 tons of beets per acre. Engaged directly in the growing and handling of the crop were 100,000 farmers, 65,000 field workers, and 35,000 mill operatives. The crop was produced almost entirely by growers independent of the factories, and under contracts entered into with the manufacturing companies in the winter of 1920–21. These companies paid the growers for beets during the past season about $50,000,000, and in addition to the expenditure for beets, approximately an equivalent amount was paid for operating supplies, labor, and railroad freights, the bulk of this money being distributed in the various territories in which mills were operated. From the fact that during the past year over one-half of the cost of producing beet sugar, and under normal conditions about 60 per cent of the cost, covers payment to farmers for sugar beets, it will be apparent that the industry is essentially and fundamentally an agricultural one. The transformation of the beet crop into edible sugar after it has been delivered at the factories by farmers is a function comparable to the handling of wheat by thrasher man and miller—necessary, to be sure, but by no means so important a factor in production as the agricultural end.

The status of beet-sugar production in our American industrial economy is frequently misunderstood because of a failure to recognize its essentially agricultural character. In the territories in which sugar-beet growing has been established the sugar factory is just as much an adjunct of the farming system to-day as the thrashing outfit, the grain elevator, the stockyard, the creamery, or other necessary marketing facilities.

In all of these districts, and more particularly in the newly developed areas in the West, the sugar factory constitutes a sort of focus or headquarters for varied agricultural activities throughout the surrounding country side. Each factory employs a staff of experienced and trained agriculturists, familiar with local farm problems, who, in a sort of advisory capacity, supervise the growing of the beet crop. Their activities correspond very nearly to those of the local country agricultural agents, with whom they work closely for the promotion of general agricultural progress.

The agricultural assistance furnished by beet-sugar companies in the districts in which they operate is a feature rather unique in American agriculture. The field specialists of the companies, while primarily interested in promoting the successful culture of sugar beets,

perform a very valuable service to all related farm activities in their districts. They are, for instance, constantly on the watch for outbreaks of plant diseases and insect pests. In the Colorado and Nebraska territories during the past season we secured by express shipment from the East and distributed among farmers over 600,000 pounds of Paris green for the purpose of combating a rather general outbreak of worms and grasshoppers threatening the destruction of alfalfa, grain, and sugar-beet crops. Prompt action, which was possible through the centralized handling of the situation, avoided in this instance a tremendous crop loss.

The field departments of the various sugar companies attend to the procuring and distribution each year of from 50,000 to 75,000 field workers. The field labor requirements of the sugar-beet crop occur at definite periods in the spring and autumn, and because of this the labor brought in for working the beets is available for field work on other crops during the balance of the growing season. This economical and complete utilization of labor makes any serious farm labor shortage virtually unknown in sugar-beet districts, a fact particularly manifested during the war period.

For many years the business of producing beet sugar was considered to be a strictly manufacturing enterprise. Beets were contracted and paid for at fixed prices which showed little variation from year to year. The fluctuations of the sugar market were largely absorbed by the manufacturing companies, and the farmers had only a mild and perfunctory interest in the marketing or market prices of refined sugar. That view of the business has undergone a distinct change in recent years, and methods and policies have been altered correspondingly. Almost without exception sugar beets are to-day purchased from farmers under contracts the prices of which fluctuate in a definite relationship with changes in the prices of sugar in the American market, and which usually provide in addition a guaranteed minimum payment not dependent upon changes in the price of sugar. The guaranteed minimum price is necessary to assure the grower a return to cover approximately his cost of production, which in turn provides sufficient stability to the business to insure a fairly constant volume of beets from year to year. This close relationship between the grower of sugar beets and the sugar manufacturer makes the prosperity of each directly dependent upon the market price of sugar.

The American farmer is to-day the American sugar producer, and as such has a most vital interest in the American sugar market and sugar prices.

The sugar beet is a crop which fits so admirably into the agricultural system of large areas of the United States, and which in many Western States at least is almost an essential part of the farm economy that in the words of a western farmer, "If the crop did not exist to-day it would have to be invented."

The experience of all countries on the face of the earth has been that a successful agricultural system demands the inclusion of a crop which is cultivated periodically during the growing season. The continuous planting of land to grain, hay, and other similar crops, which are not, under ordinary circumstances, given any cultivation after planting, brings about more or less gradually a condition under which lands become infested with weeds and other foreign growth and subject to an accumulation of plant diseases and insect pests. On the

other hand, the successful handling of a cultivated crop requires, at intervals during the growing season, a physical cultivation or loosening of the soil between the growing plants. This cultivation modifies and improves the soil structure and condition and destroys weeds and other undesirable growth, preventing their reseeding and dispersion.

In continental Europe and in Great Britain, where agriculture has probably reached its most intensive development, root crops, such as sugar beets, potatoes, and turnips, have been selected by experience as the cultivated crops best adapted to the various cropping plans. Our American agriculture possesses two other important cultivated crops in corn and cotton which, within areas fairly definitely limited by climate, satisfactorily fill the requirements of a cultivated crop. It is a well-known fact, however, that there are large areas in this country in which neither corn nor cotton can be successfully grown. Potato growing is similarly confined because of special soil requirements to fairly limited areas. Curiously enough it is in those territories where the growing of other cultivated crops is not highly successful that sugar-beet culture has reached its best development. Sugar beets have been successfully grown throughout the northern latitudes of the United States upon a wide variety of soils and at elevations varying from sea level to 6,000 feet above sea level. Many areas incapable of growing other crops successfully have found their salvation in the introduction of sugar-beet culture. The crop, for instance, exhibits a unique resistance to the effects of alkali which contaminates large areas of land, especially in the western States. The subduing and reclamation of such lands over wide areas has been made possible in a number of well-authenticated instances by the introduction of sugar-beet culture.

The value and benefits of sugar-beet growing are rapidly being recognized by farmers in the Central and Western States. Many, many communities where lands have become impoverished and infested with foul growth due to continuous cropping to grain are to-day exerting every effort to induce the construction of sugar factories in their districts. They have before them in the established sugar-beet districts a demonstration of what the crop has accomplished. I think I am safe in saying that during the past two years of agricultural depression the districts in which sugar beets are grown have without question been disturbed less than any farm districts in the country. My own State of Colorado suffered severely in its great basic industries, and particularly in stock raising and feeding, mining, and the manufacture of steel, in the depression which followed the war. It is my sincere conviction that the whole industrial and banking situation of that State was saved by the $60,000,000 paid the beet-growing farmers in the 14 months covering the delivery of the crops of 1920 and 1921. I have no doubt that a similar story could be told of many other beet-growing States.

The industrial life of America is so organized that our population is heavily concentrated in the eastern area of the country. The bulk of the food supplies for these people must be produced in the more sparsely settled districts of the Central and Western States and transported to the East. Obviously, under such an arrangement, it is of much importance, in order to avoid a waste of national energy, that the food so transported should be in concentrated form. Huge quantities of western farm products can be economically mar-

keted in the food-consuming centers of the East only by being transformed into live-stock products.

While this method of marketing crops, such as hay, corn, barley, etc., is doubtless the most feasible and profitable under existing conditions, it necessarily and unavoidably entails much waste. A large part of the food consumed by an animal is utilized to maintain the animal during the fattening period. We feed 500 to 1,000 pounds of hay and grain to produce a gain of 100 pounds of live stock.

Compare with this the economy of beet-sugar production. An average acre of sugar beets produces 2,500 pounds of pure, white granulated sugar, constituting a human food, 100 per cent of which is digestible. In addition to the major product, sugar, there are various by-products of great value. Utilizable on the farm and constituting excellent food for live stock are the plant tops which are removed before the crop is delivered at the factory, the residual pulp and the molasses from the manufacturing process. Properly fed to live stock in a balanced ration, the mere by-products from an average acre of sugar beets will produce approximately 300 pounds of meat in addition to the production of a ton and a quarter of sugar from the same acre. The by-products alone of an acre of sugar beets will produce as much human food in the form of meat as will the entire product of an acre of corn. I regard as quite conservative the estimate that the by-products of an acre of sugar beets will, properly handled, produce 300 pounds of beef or mutton. Using this as a basis, it will be apparent that in addition to the output of 1,000,000 tons of sugar each year the industry should be credited with an annual contribution to the national food supply of 240,000,000 pounds of meat products.

Many exhaustive and careful investigations have shown convincingly that there is no other crop grown on a commercial scale in the United States that produces the surplus food per acre that the sugar beet does, taking into account both the sugar and the various by-products properly utilized. In fact, I believe this comparison will apply in like manner to any crop grown commercially in the Temperate Zone.

This is a startling and comprehensive statement, but the fact has long been, and is to-day, recognized and taken advantage of by Germany and other countries of continental Europe. The English people, whose policy for so many years was to buy sugar in the cheapest markets of the world, are to-day taking steps to establish an English beet-sugar industry, and, moreover, are doing it partly by the investment of governmental capital.

The question might be asked, "Why, if the beet-sugar industry contributes so many agricultural advantages, does it need tariff protection?" Such a query can be easily and, in my opinion, effectively answered by the statement that cane sugar can be produced in the Tropics at a cost with which the sugar-beet farmer and the domestic manufacturer can not compete, but under conditions and at a standard of living which we most surely do not want to see duplicated in America.

The value and adaptability of the sugar-beet crop to American agriculture must be obvious to anyone. It is almost inconceivable that the American Government will fail to shape its tariff policy to protect the industry in the present crisis.

STATEMENT OF C. H. ALLEN, DEFIANCE, OHIO, REPRESENTING UNITED STATES SUGAR MANUFACTURERS' ASSOCIATION.

Mr. ALLEN. Mr. Chairman and gentlemen of the committee, I have been interested in the sugar business on the agricultural side for something like 15 years. About a year and a half ago, in connection with some farmer friends, we organized a sugar company with the expectation of building a sugar factory and supplying that factory with beets from our own farms. I am president of that company at the present time. In fact, I am president of a sugar company without a factory. I am representing those men at the present time. There are now about 1,200 of us in that company.

As a representative of the farmers of northwestern Ohio, who are greatly interested in the production of sugar, we wish to present our views before this committee showing what relationship this question of tariff has to our business and why we consider the question of an increased production of sugar through the growing of sugar beets on our own soil of equal interest to the consumer of food products as to the producers of the same.

It has been unfortunate that the so-called sugar companies are the only ones who have been interested enough in the sugar question to go before Congress and try to place before them the conditions governing the industry. Naturally we begin to suspect there is some ulterior motive behind their advocacy of such a measure. Because of the large amount of money invested in the plants necessary for the extraction of sugar, they have been compelled to study the question of the production of sugar from a manufacturing standpoint and they are well aware of the impossibility of continuing and increasing the business unless there is adequate protection against the climatic conditions of the Tropics.

It is time, however, the general public should know the factory end of the business is the small end of it, in spite of the large amount of money invested in factories. The sugar business is not a manufacturing business but an agricultural one.

No combination of iron, steel, glass, or cement ever made an ounce of sugar; it is not made inside of four walls nor made by operating any machines, however complicated and ingenious.

Sugar is grown, not made.

It is the product of the soil, the air and the water, just as much so as the wheat and corn and oats and cotton the farmer raises.

It requires the same careful attention from the time the seed is placed in the ground until the crop is harvested and hauled to market: it is subject to the same vicissitudes of season and climate that other crops are, whether it is grown in cane or beets.

The so-called sugar factories are nothing more than huge extractors or threshing machines that thrash the sugar from the cane or beets placed there by sunlight and rain with the assistance of the farmer.

We do not consider the owners of thrashing machines the producers of wheat and oats nor the owners of cotton gins the producers of cotton, and we should not consider the owners of sugar factories the producers of sugar.

Members of Congress and the general public should ever keep this in mind, and although the sugar business takes in the thrashing

machines, the big issue, the thing to consider above everything else, is how any action Congress may take will affect the growers of sugar (the farmer), the conservation of the soil he uses, which is the basis of the continued prosperity of our country, and the economic results that may accrue in the future to our country as a whole; necessarily this takes in the consumer of food products as well as the producer.

We must have sugar. There was a time in the history of the world when mankind could get along without it, but that time has passed. The more civilized we become, the greater the amount of sugar we use.

We can obtain it from but two sources, cane or beets.

If we get it from cane grown in the tropics the great bulk of it must come from foreign shores, if we get it from beets it can all be grown on our own soils.

What is the best policy for this Nation to pursue, grow it or buy it?

If we consider only the cost of sugar to the consumer there is nothing more to be said. Sugar can be grown in the tropics, shipped to America, run through the laundries (the refineries) and retailed throughout the country cheaper than the American farmer can raise it in this country from beets. The reason for this is climate and can not be overcome.

If we decide the best policy for this Nation is to buy it, the cheaper the better, the American farmer may just as well give up his dream of sugar production, scrap his special tools, give up the benefits he has learned the beets produce on the soil, and follow the farming methods of his forefathers.

Senator McCUMBER. And after he has given it up, what about the price, then?

Mr. ALLEN. That I can not say.

Senator SMOOT. You can guess at it?

Mr. ALLEN. Yes; we can guess at it.

If we decide to grow it we must make up our minds that it can not be done without protection from the cheaper sugar of the Tropics.

The whole of Europe could not do it, although the labor on her fields cost from a half to a third less than with us. Then how can we hope to succeed?

Why should we try to produce sugar when we can buy it cheaper?

Why did Germany, in order to develop her sugar business, pass such laws that allowed her sugar to be sold in England at less than the cost of production?

Why at the present time has France such a very high tariff rate on sugar?

Both of those countries could buy their sugar from tropical countries much cheaper than they can produce it, but instead they prefer to tax themselves, at least temporarily, for some great benefit.

What is this benefit and can we obtain it by following the same policy?

We, the farmers of northwestern Ohio, who have been growing sugar for the short space of 10 years, have begun to realize what these benefits are and see no reason why we should not take advantage of the experience of these European countries.

The production of sugar has increased the production of all crops grown after beets.

Outside of the great benefit of being independent of any foreign country in the supply of one of our most important food crops we increase all other food crops by the use of this one.

The policy governing the agricultural practices of all countries who produce large crops per acre is directly opposite to the practices we follow in this country.

We have begun to understand now why we, with practically virgin soil, have not been able to equal the yields of European countries.

For the past 20 years the great paramount issue before the American people—outside that of war—has been the "high cost of living," and the same issue is sure to come before the people when we have reached normalcy.

We farmers have been asked time and time again why food products should keep climbing higher and higher in price, and when we answer that land is increasing higher and higher in price and in order to make interest on the investment we must obtain more for the products of the farm, the question has come, why higher land prices?

The answer is because of the scarcity of good lands.

The time of cheap fertile land has long since passed. Up to 20 or 25 years ago we depended for an increased food production upon increasing the amount of land under crops; the more land under cultivation the more crops. About that time we woke up to find there was no more good land immediately available for the production of crops.

Then the pinch began, and as we are not increasing our farming land area in proportion to the increase in population, the price of land and with it the price of food products naturally increased.

Senator McCUMBER. They have not increased much lately.

Mr. ALLEN. No, sir; they have not. But think of what they were 25 years ago.

Senator McCUMBER. I am speaking of food products.

Mr. ALLEN. There has been a tremendous increase. There is talk in the cities and everywhere about the high cost of food.

Senator SMOOT. It is not too high in proportion to what it costs.

Senator McCUMBER. The wheat that goes into your flour is as cheap to-day as it has been for 20 years.

Mr. ALLEN. I shall come to that.

The American farmer is the most efficient in the world when we consider the production of food per person, but this does not increase the total amount of food, and it is this we need to feed the ever-increasing population.

Any method, therefore, that will increase this food production per acre will be of benefit to all of us whether a resident of the country or city.

We farmers of northwestern Ohio know that every farm growing beets is a better farm for other crops and shows a splendid increase in production per acre.

Is this not worth while?

The tariff on sugar at the present time is $1.60 a hundred pounds; the average amount of sugar used per inhabitant is not over 90 pounds a year, so this tariff costs us the large sum of $1.44 a year.

Is this not a very small amount to pay for such great benefits?

Would even $5 a year be too much to pay? France thought not and she taxes herself heavily for the avowed purpose of increasing her sugar production until she can produce all she uses.

Why not, when we only produce 25 per cent of what we use from beets? Our entire domestic production including insular possessions is only 50 per cent.

We agree with anyone who says, "It would be unwise to do anything that would lead to an increased price of food products and are merely suggesting a method we know will produce results."

There is one other aspect of this question we desire to call to your attention.

What relationships has the growing of beets to the great general economic future of this country?

Several years ago, during Roosevelt's administration, a great effort was made to call attention of the people to the necessity of conserving our natural resources, our birthright, our mines, our lumber, the fertility of our soils, the things we should hand down to our children; the raw material out of which the products of civilization are fashioned.

Of all these raw materials mentioned it was the consensus of opinion that the conservation of the fertility of the soil was the most important. If necessary, we could ship into the country the raw material found in our forests and mines, but the protection of the fertility of the soil was another thing, and fundamental as the real source of life and prosperity.

So important is this that our National and State Governments have for years appropriated large sums of money to further these interests, and it is only necessary to call attention to the splendid work of the agricultural experiment station of my own State as a sample of what is being done over this country to bring this fact to your mind.

For 30 years this institution has been trying to educate our people, city as well as rural, to the great necessity of preserving and conserving the mineral matter of the soil and at the same time teaching those who hold the land how to replace the mineral matter our fathers had removed and sold. These mineral matters are raw material just as much so as copper and iron, and their removal and sale in the shape of wheat and meat and cottonseed meal in time brings the same results as the sale of timber from the lands of Michigan and Mississippi.

After the raw material is gone we have nothing left.

Yet the other day I read an interview with a prominent banker in New York, who had just returned from Europe. He was bewailing the fact that conditions were such in Europe that we could not ship raw materials to Europe.

The history of agriculture in America from the time of the Virginia plantations until the present time has been one of soil depletion, the disposal of the raw material out of which crops are grown.

Jefferson and his contemporaries had great estates full of all the elements that go to make crops, but to-day the same land will not produce without replacing the raw material they extracted.

Many of these men became bankrupt because their soil failed, and their children or children's children had to migrate to other sections

of the country to make a living or else eke out a precarious existence on the worn-out soils their fathers had destroyed.

In New York State many of the valleys were the wonder of Europe for their fertility. To-day you can buy those formerly wonderful farms for less than the cost of the buildings upon them.

In my own State of Ohio 75, yes, 50 and even less than 40 years ago, no farmer thought it necessary to replace any portion of the mineral matters of the soil; to-day in many portions they can not produce a crop without the addition of some of these necessary elements.

Even in that wonderful fertile State of Iowa to obtain maximum crops we have found it is necessary to-day to replace some of the minerals sold off those lands. What will it be to-morrow?

I have stood on farms in North Dakota that to-day would not pay to farm, that as a boy and a young man I had read of as producing wonderful crops of wheat.

In the "Big Bend country" of the State of Washington, where they formerly grew 60 bushels of wheat to the acre, when I was there a few years ago they were moving away because they could not make a living.

In the South, anywhere in the piney woods, you can see, as I have done, among the second growth of pine and oak, the rows showing where profitable crops of cotton were raised, to-day abandoned because the mineral matter had been removed.

Everywhere you go it is the same story and the sadness of it all is that we, as farmers, and you as citizens of this country, never received but a mere pittance for this raw material. That is what Henry Wallace, familiarly and lovingly known throughout the entire Middle West as "Uncle Henry," the father of our present Secretary of Agriculture, meant when he said "The farmers of America have been for 300 years feeding the world at less than the cost of production."

That wizard of electricity—Edison—upon his return from Muscle Shoals a short time ago, made the remark that the main thing in regard to that magnificent project was to make cheaper fertilizer for the farmer, for he had to have it.

It is impossible at the present time for any farmer in this country to produce a bushel of wheat at a profit, or even come out even if he takes into account the price of the raw material in the wheat.

When the coal is gone from the mine, the prosperity of that section is ended. When the mineral matter is taken out of the soil not only is the prosperity of that section ended but life itself is endangered.

Would it not be wise, therefore, if the policy of our Government could be so shaped that instead of shipping our raw material we would ship out only those things that are inexhaustible?

Would it not be conserving the fertility of the soil?

Is it wise to ship our wheat, which contains from 30 to 60 cents worth of raw material, and buy with it sugar which is only sunshine and rain and takes not an ounce of fertilizing matter from the soil?

Would not raising our own sugar, keeping our fertility at home, be a wise procedure?

Why buy sunshine and rain at all; we do not need it; have we not plenty of it?

Would it not be better for us, and our children and our children's children, if we would ship butter (there is not 70 cents worth of raw material in a ton of butter) rather than cottonseed meal and meat and wheat, which contains so much of it?

Why spend so much money in our experiment stations and agricultural colleges teaching people how to replace the fertilizing elements their ancestors took from the soil instead of teaching them how to retain what they have? It took Joseph E. Wing, the apostle of alfalfa, 25 years to redeem his father's farm and put back in it the fertility his forefathers sold off it.

There are certain fundamental things we should not forget in the discussion of this problem.

Permanent prosperity comes from the sale of inexhaustible material, not from the sale of raw material.

We can not obtain prosperity by buying something, either as an individual or as a State. If we do buy something is it not better to buy something containing raw material that will be of future benefit to us rather than such things as butter and sugar which come from the air and water?

The sale in this country of Danish butter, Chinese eggs, Australian wool, Argentina beef and Cuban sugar never has, never can and never will bring prosperity to any part of this country.

This applies equally to the cities as well as the country; the East as well as the West; the South as well as the North.

New York and Chicago depend for their welfare upon the welfare of the great farming communities throughout this broad land and not upon the prosperity of foreign countries.

We have tried to call your attention to the benefits an increased tariff on sugar will bring to the farmers of northwestern Ohio, not as sugar growers, not even as citizens of Ohio, but as citizens of the United States in common with the citizens of the cities and towns; believing that Members of Congress should consider these questions as they affect the entire country and not special parts of it.

We are not asking special favors but only an opportunity to develop the farms intrusted to our care so they will be of greater benefit to the entire country and so we can leave them to our children and our children's children unimpaired, able to feed the generations that will come after us.

STATEMENT OF RAYMOND PITCAIRN, PHILADELPHIA, PA., REPRESENTING THE OWOSSO SUGAR CO., OWOSSO, MICH.

The beet-sugar industry in the Middle West in the past has been a moderately profitable industry. Under a reasonable tariff it can again become such. If an adequate tariff is not provided, the plants of this domestic-sugar industry can not continue to operate; and the farms will be deprived of one of their most profitable crops.

Many of the beet-sugar plants are practically in the hands of their bankers and creditors; and the others are weakened and impoverished by heavy burdens of indebtedness piled up during the last two years following the war.

In February next the Owosso Sugar Co. must decide whether to let contracts for beets and prepare for next year's run or close down. The other plants are in a similar position. If they are shut down, the factory organizations will be disbanded, the plants will suffer deterioration, the farms will lose their beet crops, and all the agencies involved directly and indirectly in the annual production and distribution of hundreds of millions of pounds of sugar will suffer irreparable loss.

A halfway measure of relief in the nature of an experiment which will leave to a future Congress the making of an adequate tariff will certainly be fatal to a large part of the

dustry. To shut down for a single year will so badly affect the organizations and ants that disaster would follow, even though a future Congress should recognize d endeavor to rectify such a mistake. For not only would it be difficult and costly revive the industry, but meanwhile many of the plants which are now in the most itical financial condition would fall under the sheriff's hammer, and faced with the ondition of the plants and the fate which had befallen them it would be difficult if ot impossible to refinance them.

The broad issue to be faced by our legislators is, Will tariff protection such as proided for other industries be accorded to home-grown sugar? With many of the instries which appear before you, the effect of a lower or higher tariff is problematical. n the case of beet sugar the effect of a reduction of the present emergency tariff is ertain. For the next two years we need more protection than that tariff provides. nything short of the present emergency tariff as a fixed and continuing measure will ave the business open to constantly recurring periods of jeopardy.

What we would impress upon you with all the earnestness at our command in this ppeal is that our hour is come, it is for you and your colleagues to say whether the eet-sugar industry shall continue or close down. It is for Congress also to decide hat effect the extermination of the domestic-sugar industry will have on the price of ugar in this country. The advantage taken by the Cubans of the sugar market during he war should give the answer to this question. It is a momentous decision. We ope for the protection which we must have, but it would be better for us to know the worst and close down at the end of our present campaign rather than to take the certain isks of the business under an inadequate tariff. This would prolong our span of life, ut result in further losses of money which, even if our best tariff hopes are realized, will be most difficult to obtain to meet the cost of planting, cultivating, and harvesting a new crop of beets and to purchase the coal, limestone, and supplies and to meet the factory pay rolls and overhead, which are essential to another year's business.

The industry has had a history of struggle and slow growth. But we believe that its record from the beginning up to the outbreak of the war has justified the labor and means bestowed upon it and the protection which it has received. Certainly the beet-sugar industry was justified by the service rendered to the public during the war. The sugar plants in the State of Michigan alone supplied over 250,000,000 pounds of sugar per annum which, through the agency of the Government, whose rulings we accepted, were sold by the producers at prices not exceeding 12 cents per pound, as fixed by the Food Administration during a period when sugar was sold by the cane refiners, by sugar brokers, and Cubans at 25 cents and 30 cents per pound.

We were at war, the beet sugar producers accepted with resignation the prices fixed by the Government, despite the best legal advice that the practice employed was unconstitutional. But the vital fact is that Government price fixing which discriminated too heavily against the domestic industry, was instrumental, under the present sugar crisis, in bringing the beet sugar industry to the verge of ruin. Had the price fixed by the Government been sufficient to allow a reasonable profit, reserves could have been provided which would have enabled us to meet the world crisis in sugar which now faces us.

The value to the country of this domestic sugar during the war was recognized by all who had a knowledge of the situation; this was recognized quite generally. On the other hand the war prices charged for Cuban sugar gave ample proof of what market conditions at home would be without the domestic supply an domestic competition.

The desperate situation of the beet sugar industry in the face of the world-wide sugar crisis, for the reason stated, is due in no inconsiderable extent, to Government control. But there are definite market conditions which have been instrumental to bringing about the crisis which the beet sugar industry must meet in the weakened condition brought about by price regulation. The present low market in sugar which threatens bankruptcy to many producers of cane sugar, as well as to the domestic beet sugar industry, has resulted from a great over-production of sugar in Cuba which followed a period of enormous speculation growing out of the excessive profits derived from the high war prices charged by the Cuban producers and cane refiners. Speculative purchases by Americans of Cuban sugar properties at inflated prices, and the flotation of companies which promised large profits, which paid their promoters handsomely was coupled with an increase in the Cuban production from 2,300,000 to 4,000,000 tons. Prominent New York banking interests loaned freely on these securities of mushroom growth. Now that the inevitable has happened, the banks and other holders of these securities are not unwilling that the beet sugar industry at home should be ruined if, in the process, they may recoup themselves. As heretofore, the large eastern refiners are making active efforts to discredit and ruin the domestic sugar producers, and it is they who are responsible for the opposition to the proposed tariff.

While the Cuban production was nearly doubled, the beet sugar production has been very little increased. Will Congress fail to recognize the equity of the country's home industry and grant a permanent tariff yielding 2 cents per pound on foreign sugar, which is the existing emergency tariff, as a permanent protection to the producers and farmers in order that the industry may make a fair living, and the public have the advantage of home competition?

It would be difficult to select any article more justly entitled to the benefits of a protective tariff than beet sugar. Even if the history of the industry should be ignored, last year the Owosso Sugar Co. alone paid to the farmers in Michigan over $2,000,000 for its beets. There is perhaps no tariff on the list of manufactured articles which proves so direct a benefit to the farmers as that on beet sugar. Over 60 per cent of the cost of our sugar is paid direct to the producing farmers. In addition to this the industry employs thousands of men, provides work for thousands more in the production of great tonnages of coal and limestone, pays large sums for freight to the railroads, supplies to the farmers in the form of dried beet pulp a considerable part of their cattle food requirements, and produces large quantities of molasses, the base for the production of denatured alcohol. And, to a lesser extent, winter food for grazing stock is provided by the beet tops, and by-products furnish valuable fertilizers. The present duty on sugar still gives to the Cuban producers a preferential rate of duty into the United States, which assures them a market here for such large amounts of additional sugar as we require, at prices materially higher than they can get in the open markets of the world. The duty to these other foreign markets should, we believe, be fixed at 2 cents.

The Republican Party has repeatedly promised fair protection to American industries, and there are facts and statistics on record in Washington filling many volumes showing that the beet sugar industry must have the amount of protection asked for if it is to continue to exist.

The beet sugar industry in Michigan and the Middle West was established through the efforts of the United States Government. Its development followed the call of James A. Wilson, former Secretary of Agriculture, whose zeal for this project of the department led to personal appeals made by the Secretary to investing citizens and farmers of the country. In response to this earnest solicitation on behalf of the Government, and because of promised aid in the form of a tariff, money was subscribed, the plants were built, and extensive sugar beet farming in the Middle West cultivated. The part played by the Government in furthering sugar beet culture, and its recognition of the public advantage involved, is a matter of record in the files of the Department of Agriculture. Will the Government desert the industry which it has been instrumental in building up? If so, the end is at hand.

STATEMENT OF GEORGE W. McCORMICK, GENERAL MANAGER, MENOMINEE RIVER SUGAR CO., MENOMINEE, MICH.

The CHAIRMAN. Will you state your name to the committee?

Mr. McCORMICK. My name is George W. McCormick.

The CHAIRMAN. Mr. McCormick, will you state your business?

Mr. McCORMICK. Manufacturer of beet sugar, Menominee, Mich.

The CHAIRMAN. Your concern is located there, is it?

Mr. McCORMICK. Yes, sir.

The CHAIRMAN. Are you in operation now?

Mr. McCORMICK. We are.

The CHAIRMAN. On full capacity?

Mr. McCORMICK. When we are operating the factory we run full capacity.

The CHAIRMAN. Now?

Mr. McCORMICK. We have just finished the cutting of beets for the season.

The CHAIRMAN. All right. You may proceed, Mr. McCormick.

Mr. McCORMICK. Mr. Chairman and gentlemen of the committee, I don't want to give you any long history. I want to cover the subject, the pith of it, in as few words as I can.

In the first place, I want to state the condition of the beet-sugar industry to-day. There are about 43 companies operating. Th

ondition of 60 per cent of those companies is that if they were alled upon to settle to-morrow or to-day they could not do it.

The CHAIRMAN. Is that not true of almost every concern in the United States?

Mr. McCORMICK. It is probably true of some of them, Mr. Chairman.

Senator SMOOT. If there was a settlement they would not have nything left.

Mr. McCORMICK. I mean by that statement that it would not nly wipe out all of their quick assets, but if there was a mortgage on heir plants, if their plants were sold out, it would not cover the ndebtedness.

That condition of the beet-sugar industry is not exactly the result f what is commonly spoken of as the decline during the reconstruction after the war. The beet-sugar industry of the United States nds itself to-day in the most critical condition in its history. It tands on the verge of disaster. There is not a beet-sugar factory in ny one of the 17 States in which this industry is established that id not take a staggering loss on the crop of sugar produced in 920. They had contracted with the farmers for their beets at he highest prices ever paid, induced by the prevailing high price of ugar at the time these contracts were made with the farmers. Throughout the year 1920 every supply for the operation of their lants cost them peak prices, and the labor employed was paid correspondingly high wages, the highest ever paid in the history of the ountry.

The CHAIRMAN. What do you mean by "the highest ever paid in he history of the country"?

Mr. McCORMICK. The wages paid in the year 1920, Mr. Chairman.

The CHAIRMAN. Do you mean to say they paid higher wages than ny other form of industry?

Mr. McCORMICK. No. I mean that the scale of wages paid that ear in the sugar-beet industry was higher than the scale of wages ver paid before. I am speaking of the sugar industry as a whole n that respect.

The CHAIRMAN. Higher than previous years in that particular ndustry?

Mr. McCORMICK. Yes; higher than previous years in that particular industry, due to the fact that there were higher wages prevailing n all industries than had prevailed heretofore.

Now, by the time the sugar from that crop was made we found urselves in a peculiar position. The prices had slumped to a mere raction of what they had been, and the market was demoralized nd glutted with foreign sugars from every part of the world. We ad predicated the cost of our beets, the price of our beets to the armers, on prevailing prices of sugar at the time the contracts were made. When the sugar was made from that crop we found ourselves in that situation, as I say, that the price had slumped to a mere fraction of what it had been, and the market was demoralized nd glutted with foreign sugars from every part of the world. I want o emphasize that point, that the market was demoralized and glutted with foreign sugars from every part of the world. The result was that beet sugar had to be sold at from $2 to $4 per hundred pounds below the actual cost of production. In fact, within 12

months from the time the 1920 crop came onto the market ther had been wiped out and lost to the industry, as nearly as we ca compute it from the facts at hand, $60,000,000, or one-third of th entire investment in the beet-sugar industry in the United States.

Referring particularly to the individual companies, I want to sa that before the year 1920 the beet-sugar factories of the Unite States were universally in sound financial condition and had suffi cient working capital, but in the operation of the business that yea in a number of cases their surplus and working capital was wiped out in some cases their capital was impaired, and a few were so disable by their loss that they were compelled to close their factories an cease to operate in the year 1921.

Then we come to the crop of 1921, the one just being made. Whil the companies were in the condition before stated, they had hope that a better result would be obtained this year and that they migh possibly recoup their losses, but instead costs of production were no reduced as much as we had hoped, and the price of sugar droppe still lower until to-day over 50 per cent of the beet-sugar compani of this country are in very serious financial straits. In order to me the beet pay roll—that is, in order to pay the farmers for the beet they raised, and God knows the farmers need what money they ca get this year—these sugar companies were obliged to exhaust ever means at their command to borrow sufficient funds to pay for the beets and for the operating expenses of their factories. They ex hausted their credit at the banks, they borrowed money on the sugar against warehouse receipts, they have mortgaged their plant and in some instances were finally obliged to apply to the W Finance Corporation for a loan in order to meet their farmers' pa rolls. The fact of the matter is, gentlemen, there are certain bee sugar companies that have not yet been able to raise sufficient fun to pay the farmers for their beets for the pay rolls that were due o the 15th of November.

Senator Calder. Will the witness permit a question? Has he r quested to be permitted to proceed without interruption?

The Chairman. I have not heard any such request.

Senator Calder. You are harvesting and marketing your cr under the emergency tariff law now in effect, are you not? Do y understand my question?

Mr. McCormick. Yes, sir; I do. I do not know who you are.

Senator Calder. I am Senator Calder, of New York.

Mr. McCormick. I beg your pardon, Senator. I am glad to kno you. I will be very glad to answer your question.

Senator Calder. You are marketing your crop this year under t emergency tariff law?

Mr. McCormick. Yes, sir.

Senator Calder. That gives you the same rate as the Fordn measure now pending before this committee?

Mr. McCormick. It is the same.

Senator Calder. And you have difficulty living under that law?

Mr. McCormick. Yes, sir.

Senator Calder. Then how do you expect to continue without greater tariff than that bill provides?

Mr. McCormick. That is what we are going to ask you for.

Senator CALDER. You are going to ask for even more than that?

Mr. McCORMICK. Most assuredly; yes, sir.

Senator CALDER. Your statement indicated that you would want great deal more than that.

Mr. McCORMICK. We certainly are entitled to more than that.

Senator CALDER. I would like you to develop that as you go along.

Mr. McCORMICK. That is what I am trying to do.

Senator CALDER. I would like you to develop how you hope to exist under the tariff the House gives you if the conditions are as bad as you have indicated in your statement.

Mr. McCORMICK. I will be glad to develop that.

The CHAIRMAN. Do you want a complete embargo on the importation of sugar?

Mr. McCORMICK. We are not asking that, Mr. Chairman.

For your information particularly, Senator, I want to call your attention to the matter of costs this year. We have a quoted price of $4.80 per hundred pounds for granulated beet sugar to-day. This is the condition we are facing. Cuba is holding about a million and a quarter tons of sugar over from last year's crop and, it is commonly reported, is threatening to have that sugar thrown on the market at 1 cent a pound. The quoted price to-day on that raw sugar, freight paid, delivered at New York, and sold in the months of January and March, is 2 cents a pound. If that sugar comes on the market at that price it will mean a dollar decline in the price of refined sugar from the present quotation, which would mean that beet sugar would be sold at $3.80. That is the condition we are facing, Senator, and for which we are hoping some remedy.

Senator SMOOT. The Government has advanced 4 cents a pound on it to pay the farmers for their beets. There is not a sugar factory in the United States that could have paid the farmers without that advance.

Senator CALDER. Who has advanced that?

Senator SMOOT. The War Finance Corporation.

Mr. McCORMICK. The price has already declined to $4.80, and there is not over 25 per cent of the beet-sugar production of last year's crop marketed up to this time. Therefore, we are left with three-fourths of our crop on hand, threatened with a $3.80 price, which is below the price that our own Government, the War Finance Corporation at least, has deemed a safe price to advance money on.

Now, about the matter of costs of this particular crop, which we took care to ascertain from a number of the companies—in fact, 16 of them. The average cost of producing beet sugar from this crop, as estimated by 16 of the largest and most efficient factories, is $5.09 per hundred pounds, while in the territory east of the Missouri River, where most unfavorable weather conditions prevailed this year, the average cost is over $6 per hundred pounds.

We are not going to ask you gentlemen to give us a tariff to cover weather conditions. That unfavorable weather condition prevailed in the eastern territory, and is not an average condition. We are willing to stand on the average.

Now, if the 16 most efficient factories have a cost of $5.09 per hundred pounds for this year's crop, and the price to-day is $4.80, and we have three-fourths of our crop on hand, it is not going to take

a very capable statistician to figure out the answer from the stand-point of profit and loss on this crop.

Now, if the beet-sugar companies are to operate in the year 192 they must be ready to go before the farmers with their contracts fo beets for next year in the month of January. They must solicit th acreage from the farmers. At that time they must fix the price whic they are to pay the farmers for next year's crop. I want to ask you under present conditions and with the prospect as it stands, how ca these beet-sugar companies proceed and make the price to the farmer or finance another year's operations? A few of the larger an stronger companies may be able to do it, but it is no exaggeration t say that 50 per cent of the companies can not and will not proceed but will remain idle.

I do not want to give this committee the impression that we do no expect to make sugar for less money than $5.09 per 100 pounds i the coming year. We do expect to. We are coming down a littl off of the hill in the cost of production. While we do not expec labor in this country to get down to the prewar level, we do kno that it has been very considerably reduced. We know that th railroad freight rates of to-day in our area are from 70 per cent to 8 per cent higher than they were in prewar times. As the raw materi is bulky, our freight charges are very heavy. We do anticipate lower freight rate for next year.

We have one factor that we do not hope to reduce in our cost shee and that is our taxes. There is not a municipality, county, State, o even the Federal Government tax that is not to-day double and i some cases treble what they were before. That is one item that w can not reduce, and that was due to the fact that the United State was in a war which our competitor, Cuba, was not in, and we have tremendous war debt—State, county, and National—that has to b paid. Every industry in the United States has to pay its share of th debt, and the beet-sugar industry if it continues has got to pay i part of it. That is an irreducible item in our expense sheet.

Another item that we can not reduce is this: The interest on bond that we have already been forced to issue. With the wiping out our working capital and surplus, every beet-sugar company has ha to borrow more heavily than it did before. The interest charge going to be an increasing item on our expense sheet. However, w do expect to produce sugar at a lower cost the coming year than w have this past year, if we operate.

Senator, this condition of the domestic beet-sugar industry ha been brought about by the importation of sugar from foreign coun tries, a matter over which we have no control. We must, therefor ask relief from the only source possible, and that is the Congress the United States. The relief, if it is to be given, must be given soo or a large number of the factories can not operate another year.

Now, we listened yesterday to the plea before this committee o foreign nation for relief for her sugar industry. The relief asked is a reduction in our present tariff on sugar, which if granted pra tically spells annihilation of the beet-sugar industry of the Unit States. Therefore, with these two interests coming before you, resolves itself into a question of whether your action, after you ha given consideration to the subject, is going to be to grant the relief a foreign industry or whether you are going to grant relief to

omestic industry that will permit it to live—one or the other. There no reason in our judgment why both industries should not live. Whose plea will Congress heed, that of Cuba, a foreign nation, or that f the domestic beet-sugar industry? Right here I can make no atement that is more pertinent to the question than to quote the ords of President Harding, in his annual message to Congress on ecember 7 last, when he says:

Sensible of every obligation of humanity, commerce and finance, linked as they e in the present world condition, it is not to be argued that we need destroy ourselves be helpful to others.

A few sentences further he makes this statement:

It is not an unworthy selfishness to seek to save ourselves where the processes of at salvation are not only not denied to others but commended to them. We seek undermine for others no industry by which they subsist; we are obligated to perit the undermining of none of our own which make for employment and maintained tivities.

If that is the policy to be pursued by the American Congress the eet-sugar industry needs no advocate of its cause in Washington, xcept to state the conditions as they are.

Through a well-organized propaganda there has been created a onsiderable sentiment in this country that something should be one to help Cuba in her present plight. Those interested in this ropaganda are advancing the claim that Cuba responded so nobly uring the war in increasing her production of sugar and selling it t a reasonable price agreed upon between herself and the allied overnments.

Another reason which they advance is that there are many millions f dollars of American capital invested in the sugar industry of Cuba. But in the arguments sent out to Members of Congress, to the press, o manufacturers, to merchants, and to the libraries of this country hey do not rest their case on what they did, but they make an inidious attack on the beet-sugar industry of this country, with the ope that they may create sufficient sentiment to lead Congress to nact legislation which will, within a few years, utterly destroy his great domestic agricultural industry. They go on to show the eplorable condition which Cuba is in to-day, and while they do not rint it they make thinly veiled threats that unless they get what hey are asking for a revolution will result in Cuba, the United States vill be obliged to intervene, annexation will be the inevitable result, nd America will have another little brown brother on her hands.

Let us look the facts in the face. Let us briefly review the records nd the justice of the claims before the American people of the Cuban terests on the one hand and the domestic sugar industry on the ther.

Let us first take the record of the domestic sugar industry. In 897 our Government, after a careful investigation of the beet-sugar ndustry in foreign countries and its beneficial effect on agriculture, etermined to have that industry established in the United States. campaign of education among the farmers and business men of he country was made. There was included in the Dingley tariff duty of $1.68½ a hundred on foreign sugar entering this country. Through the efforts of Secretary Wilson in his educational campaign

among farmers and business men beet-sugar factories were built an farmers began to grow sugar beets.

The domestic beet-sugar industry, which at that time was practi cally nothing, has grown until to-day American capital has investe in round numbers $190,000,000 in beet-sugar factories and equipment last year 880,000 acres of American farms were planted to sugar beet 100,000 American farmers were engaged in sugar-beet culture, ap proximately 85,000 laborers were engaged in the beet fields, and 35,00 laborers were engaged in the operation of the factories. There wa produced from these American farms and manufactured in thes American factories approximately 1,000,000 tons of standar granulated beet sugar, or 25 per cent of the total sugar consumptio of the United States. The number of factories has increased fro 6 in 1897 to 106 in 1921, and these factories are not located in th large cities and congested centers of population but are located i the agricultural areas of 17 States of the Union, and they are attrac ing laborers and others farmward, one of the very things our Presi dent in his message is asking that some action be taken towar accomplishing.

The number of factories has increased, as I stated, to 106, an during that period since 1897 the American people have been provide with a supply of sugar at reasonable prices, with the exception of th year 1920.

These facts alone argue the wisdom of the steps taken by ou Government to establish this industry. Let us follow this a little.

The World War came in 1914, and immediately over one-third the world's production of sugar was hemmed in from export by th allied armies. The great sugar-importing nations of Europe turne to the Western Hemisphere, the nearest point of supply, to secu their sugar, creating an unprecedented demand and higher prices f this commodity.

When the United States entered the war in 1917 Mr. Hoov was appointed Food Administrator, and one of his first acts was mobilize the food resources of the United States. Several confe ences were held in Washington between Mr. Hoover and the repr sentatives of different food-producing industries, but the beet-sug manufacturers were the first to voluntarily place in his hands t entire product of their factories at an agreed price of 7.25 cents p pound, when the New York wholesale price of imported cane gran lated sugar was 9 cents per pound. The control of the price and di tribution of this large amount of domestic sugar served him well as leverage by which he was able to induce Cuba to accept a reasonab price for that quantity of their sugar imported into this country.

The food administration fixed the price of beet sugar througho the war, and for a year and a half after the close of the war pri restrictions were placed upon the domestic beet-sugar product by t Attorney General, acting as food administrator. By reason of t action of the domestic beet-sugar industry the people of Ameri during the war obtained their supply of sugar at a lower price th any other country in the world, and at no time did the beet-sug industry obtain more than a modest profit on its commodity.

This is the record of an American industry, within the confines our own country, at all times subject to the laws and regulations a needs of our people.

Let us look at Cuba's record, putting forth the claim she has, and see what she has done and what we have done for her.

In 1898 she was producing 350,000 tons of sugar. Her people were starving, ragged, fighting for liberty against an oppressor. America sent her Army and Navy, drove out the oppressor, and set her free. We established her Government, established her schools, cleaned up her cities, organized her militia, furnished capital to a considerable degree to start her industries, and we stood by and steadied her on her feet until she was able to take care of herself.

In 1903 we entered into a commercial treaty with Cuba whereby we agreed to give her a discount of 20 per cent off our regular tariff duties on all her exports to the United States. We have 110,000,000 people to furnish a market for her, and she has less than 3,000,000 to supply a market for us—a pretty good bargain.

Senator CALDER. Will you tell the committee what amount was imported from our country into Cuba? Have you that figure?

Mr. McCORMICK. Yes. May I take that when I come to it?

Senator CALDER. Yes.

Senator McCUMBER. That was given yesterday and is in the record.

Senator SMOOT. Yes; the highest in her history.

Senator McCUMBER. It was gone into in detail.

Senator SMOOT. It is all in the record.

Senator CALDER. You will come to it later?

Mr. McCORMICK. Yes; I will come to it later.

By this action we gave her practically a monopoly of the American market against all other foreign sugars, and by this preferential treatment she has prospered as few other nations have, and the phenomenal growth of her sugar industry is a matter of history.

Throughout the war Cuba sent none of her sons to foreign shores to fight, and with no war industries to absorb her labor the planting of additional thousands of acres in cane and the building of new sugar factories assumed a mad race, and many American capitalists, lured by the vast war-time profits, rushed in and invested tens of millions of dollars in her sugar factories new and old. It is claimed that Cuba is entitled to special recognition because of the fact that she increased her sugar production in order to supply the Allies with this necessary commodity, but it can not be doubted that the spirit of pecuniary profit entered into the equation at the same time.

Cuba boasts loudly that on July 31, 1919, she so generously offered the then forthcoming crop of sugar to the United States Sugar Equalization Board at 6½ cents a pound. That came out yesterday. Let me call your attention to the fact that the prevailing price of raw sugar on the very day that she made that magnanimous offer was 5½ cents per pound f. o. b. Cuba, which is a mere matter of $1 a hundred pounds, and she produced that year 3,730,000 tons of sugar. Multiply that at your leisure and see what it amounts to. It was a very modest demand.

But as a strong argument she claims she came up here and offered that. Our Government somehow did not see fit to accept that offer, and in September, when all restrictions were removed on sugar so far as Cuba was concerned, the offer was withdrawn. From that day on we see the price of sugar going up.

In September, 1919, all war control and restrictions were removed from Cuban sugar. The trade routes and markets of the world

were opened for her to sell her crop to the highest bidder, and the Cubans were quick to take advantage of the opportunity. At that time the f. o. b. New York price of Cuban raw sugar was 5.88 cents per pound. But from that time on the prices began to rise rapidly, until by the middle of December they were selling their raw sugar at 12½ cents per pound f. o. b. New York. In April following, when the supply of domestic beet sugar was practically exhausted and they saw no other competition, the price of Cuban raws rose by leaps and bounds, and in May, 1920, they put their price up to the unprecedented figure of 22½ cents per pound f. o. b. New York. Keep in mind, gentlemen, this was the same sugar which they had so magnanimously offered to the United States Sugar Equalization Board in July, 1919, at 6½ cents per pound. The wholesale price of this sugar in refined form f. o. b. New York reached 26½ cents per pound, and the American housewife was forced to pay from 30 to 35 cents per pound, and was unable to secure even at this price an adequate supply.

Senator CALDER. Did the beet-sugar price follow the Cuban price up at that same time?

Mr. McCORMICK. I am glad you asked that question. It is a pleasure to answer you.

The beet-sugar price was restricted by the Attorney General of the United States in the early part of November, 1919, and that restriction stayed on until that crop was sold—that is, the beet-sugar crop—but there was no restriction put upon the price of imported sugar into the United States. As an illustration, Senator, in November of 1919 I was selling sugar at 11½ cents a pound, standard granulated beet sugar, when Brazilian raw sugar darker than your hat, as the saying goes, was offered for sale in New York at from 14 to 16 cents a pound. Does that answer your question?

Senator CALDER. Do I understand your price was restricted by arrangement with the Equalization Board at that time?

Mr. McCORMICK. No. Let me make this clear. The Attorney General of the United States was appointed food administrator, and under him the price of domestic sugar was restricted first to 10¼ cents, later I think it was 11, and finally the highest price at which he permitted the beet-sugar industry to sell its sugar was 12 cents. That is a matter of record.

Senator CALDER. At the same time, do I understand Louisiana sugar was being sold at from 17 to 18 cents?

Mr. McCORMICK. Yes, sir; that is true.

Senator CALDER. And you were required to sell your sugar for 12 cents while they were getting 17?

Mr. McCORMICK. That is true.

Senator CALDER. The same sugar?

Mr. McCORMICK. No; one is cane sugar and the other is beet sugar.

Senator CALDER. As far as the public was concerned was it the same?

Mr. McCORMICK. As far as the public was concerned I would say that one was absolutely the same as the other.

Senator CALDER. The beet-sugar men were very magnanimous?

Mr. McCORMICK. We were not magnanimous. We were compelled by the Attorney General of the United States in that particular in

tance, through that restriction, to the 10½-cent price which he first fixed.

Senator McCUMBER. The Attorney General had power to fix the price?

Mr. McCORMICK. Yes.

Senator McCUMBER. Has he not equal power to fix the price on the imported sugar?

Mr. McCORMICK. One was a matter of local regulation within the confines of the United States and the other seemed to be a matter pertaining to importation, which, I believe, is usually governed by the tariff.

Senator McCUMBER. It is with respect to importations, but you were not governed by a tariff. You were governed by a rule concerning the sale within the United States. If the Attorney General had authority to fix the price of sale of domestic sugar in the United States, did he not have the same authority to fix the price for any imported sugar which should be sold in the United States?

Senator SMOOT. Mr. McCormick, may I suggest that the Attorney General was acting under an act of Congress to prevent profiteering. The practice was for the beet-sugar manufacturer to sell his sugar, and that was restricted, as you have said, first to 10½ cents, then 11 cents, and then to the highest price of 12 cents, acting under that law; but when Cuba sold her sugar to American refiners at 22 cents a pound there was no profiteering in it, and the law did not affect them at all. I know of cases where beet sugar was bought at 10½ cents and sold nearly twenty times without even handling the sugar or removing it from the car, and it was not profiteering in each of the transactions because it was within a reasonable amount of profit. Of course, finally, the price reached almost what the Cuban sugar price reached.

Senator McCUMBER. In other words, the construction the Senator would give of that law was that it provided or permitted the Attorney General to prevent profiteering by people in the United States, but it did not prevent profiteering of citizens of the United States who had their holdings in a foreign country and brought their product into this country. I could hardly give it that construction.

Senator SMOOT. It was declared unconstitutional by the Supreme Court of the United States.

Senator CALDER. Senator Smoot's statement seems to indicate that the beet-sugar product sold at a higher price than the Cuban.

Senator SMOOT. The candy manufacturers of the United States made all kinds of offers to get it. They thought there was a shortage of sugar, as so many people testified there was a shortage of sugar in the world. I know candy manufacturers who offered our people out West prices of 8 and 9 and 10 cents higher than the Attorney General would allow it to be sold, but they could not sell it. They abided by the law.

Senator McLEAN. Did I understand Mr. McCormick to say Louisiana sugar sold at 17 cents, and at the same time beet sugar was selling at 12 cents that was produced in the United States?

Senator SMOOT. I will tell you why that was. I know what was stated on the floor of the Senate. When the Attorney General authorized the sale of the sugar made from cane in the South an

investigation showed they were not profiteering when they wer selling their sugar at 17 and 18 cents. The Senator from Louisian is here and can explain it in detail.

Senator CALDER. I do not understand why the beet-sugar peopl permitted that to continue, when they were kept down to 11½ and 1 cents and the cane-sugar people were selling at 17 and 18 practicall the same product.

Senator SMOOT. Senator Calder, if you remember, I do not thin there was a week passed during that time but what that very questio was called to the attention of the Senate and of the country, but i was not profiteering under the law if you made no more than a certai percentage upon a transaction.

Senator MCLEAN. Under the law as interpreted by a Democrati Attorney General.

Senator SMOOT. It happened to be a Democratic Attorney Genera at the time.

Senator MCLEAN. You say the Supreme Court declared it uncon stitutional?

Senator SMOOT. Yes; it was declared unconstitutional by the Su preme Court of the United States.

Senator CALDER. What I am trying to ascertain is this: Men i business make as large a profit as they can, in every line of busines A man gets all he can for the thing he produces. Is it a fact that th people interested in your product were making and selling the product for 12 cents a pound? It seems to me that would leave the with a considerable profit from the sale of sugar. Is it fair to assum that every other man interested in importing sugar was violatin every decent rule in asking enormous prices?

Mr. MCCORMICK. Senator, it seems to me the question has alread been answered. However, we were within the United States, an even if we had the greedy appetite to do it we could not have violate the rules and restrictions of the Department of Justice. The Cuba sugar which came in here was not under those rules and restriction but was sold to American refineries at the top high price. We coul not have helped ourselves if we had wanted to. We did present o case, and they did advance the price from 10½ to 11 and then 12.

Senator SMOOT. Senator Calder, I want to call your attention the fact that there was an agreement between the beet growers an the Food Administration as to what the manufacturers should pa for the beets.

Senator CALDER. It seems from the statements that have be made that there were different prices for beet sugar, Louisiana suga and Cuban sugar. I do not understand how that could be, becau we paid the same price for all three.

Mr. MCCORMICK. Pardon me, Senator, you come from New Yor

Senator CALDER. Yes.

Mr. MCCORMICK. The only beet sugar that went to New York w what Mr. Hoover asked us under great stress, under a condition famine, to send down to help out you poor fellows in New York an give you a little sugar for your coffee, when the great Cuban trade di not give you enough.

Senator CALDER. But we had to pay the same price for it when w got it.

Senator SMOOT. No.

Senator CALDER. The housewives tell me so. They protested against it as robbing the people who had to use it every day.

Mr. McCORMICK. Pardon me. Your memory and the facts do not seem to agree. The price was made by the Food Administration.

Senator McCUMBER. While we were paying 30 and 35 cents a pound for imported sugar at retail, do you mean to tell me the home product was sold for a much less price at retail?

Mr. McCORMICK. That is not exactly the case, Senator.

Senator McCUMBER. That is the point I am getting at. While the Food Administration cut down the price of the producer, it did not help the consumer any, because the consumer was still paying the price fixed by the high price of the imported sugar. Is that right?

Mr. McCORMICK. Let me just explain. I am talking now about the period of these high prices in the year 1920.

Senator McCUMBER. Yes.

Mr. McCORMICK. Up until April of 1920 beet sugar was on the market in the Middle West, not in the Atlantic Seaboard States, and our beet sugar was sold at not to exceed 12 cents a pound to the wholesale grocers. As soon as that beet sugar was practically exhausted, which was along in April, the record shows that the Cuban raws shot up from about 12½ cents—I haven't the exact figures before me—to 22½ cents, after competition was removed. We could not sell beet sugar for any more than 12 cents a pound.

Senator McCUMBER. When you were selling beet sugar at 12 cents a pound—that means, of course, the granulated sugar?

Mr. McCORMICK. Yes, sir.

Senator McCUMBER. What was raw sugar bringing—imported sugar?

Mr. McCORMICK. In December, 1919, raw sugar was quoted, delivered in New York, at 12½ cents. The fact is that Brazilian sugar was sold in New York at 14 to 16 cents; but we were not allowed to sell our standard granulated sugar for domestic use at over 12.

Senator McCUMBER. After that imported sugar was refined and put on the market, what did it sell for?

Mr. McCORMICK. That 12½-cent sugar?

Senator McCUMBER. Yes.

Mr. McCORMICK. I can easily give you those figures in a short time.

Senator McCUMBER. Do you not know about what it was sold for? I am not particular within a cent or a half cent.

Mr. McCORMICK. Do you recall, Mr. Hathaway?

Mr. F. R. HATHAWAY. The Equalization Board drew a line of demarcation across the country. West of that line cane sugar was not permitted; east of it the market was supplied by cane sugar. That sugar went up to the price Mr. McCormick has suggested. The regulations of the Government provided the charge which the wholesaler and retailer might make.

Senator McCUMBER. Then he fixed a different price for beet sugar in the beet-sugar section and cane sugar in the eastern section.

Mr. HATHAWAY. Yes. During the time Mr. McCormick has stated the retailer was selling beet sugar throughout that district at about 14 or 15 cents a pound. At that time the Equalization Board called on the beet-sugar people to supply a certain amount of sugar for the territory east of Buffalo and Pittsburgh. You had run out of sugar down there. You were using foreign sugar. That raw-sugar price

could not be regulated under the United States statute. After it was brought in here the price the refiner might charge, the additional price which the refiner, wholesaler, and retailer might charge, could be regulated, but the price of the raw sugar could not be regulated. While the people in our good section of the country bought beet sugar at a retail price of 15 cents, you were paying 25 and 30 cents, because you were dealing with the foreigners.

You ran out of sugar. The Equalization Board called on us to supply you with sugar. I shipped most of that sugar myself. I furnished that sugar at 10½ cents. The Equalization Board took that sugar and made 1 cent a pound profit. They permitted me, when I sold it at 10½ cents, to make one-half cent a pound profit. They sold it at 1 cent a pound profit. It went to the wholesale grocer in your section of the country at 11½ cents. The wholesaler was charged with the distribution of that particular amount of sugar, and that sugar went at a correspondingly low price to the ultimate consumer; but the amount that could be spared to liquidate your condition in the east was very small.

I wish to assure you, sir, that after the beet sugar went off the market—and all of our sugar went into consumption by April—by that time the imported raw foreign sugar supplied the entire country, and the price of the imported sugar was about 23 cents. Then your price of refined sugar throughout the entire country was based on that 23 cents, or 23½ cents for the raw sugar.

Speaking of my own company, the largest manufacturer of sugar east of the Mississippi River, we sold no sugar at any time during Government control above the exact price they fixed. Our average price for the entire crop, during the period when the Cubans were getting 23½ cents and when American refiners were paying that price for the raw sugar, our average price was $11.89 a hundred.

Senator McCUMBER. That covers my question quite thoroughly.

Senator CALDER. It is a fact that in the part of the country where I reside we did not get your sugar any cheaper than the Cuban sugar.

Mr. HATHAWAY. The sugar that was shipped into this section of the country went principally to Pittsburgh, the line of demarcation was a boundary line between Ohio and Pennsylvania, drawn by the Equalization Board. The sugar that was shipped by us went to two markets. One of them was Pittsburgh. In other words, the Equalization Board was relieving that portion of the territory nearest the boundary line with beet sugar. The second shipment went to Baltimore. That was reaching down to the South. The third shipment went into New England. We did not ship any direct to New York City.

Senator CALDER. I was quite sure we did not get any of it.

Mr. HATHAWAY. We did ship two or three carloads to Philadelphia.

Mr. FRANK C. LOWRY. I was a member of the Equalization Board. May I make a short statement?

Senator McCUMBER. If you desire.

Mr. LOWRY. The Equalization Board was going out of business on the 1st of January, and that crop of Cuban sugar did not come in until after that time. There was a shortage of sugar in the East, the Cuban crop having been used up. We called upon the beet-sugar people to try to let us have 100,000 tons that we could ship east of Pittsburgh and Buffalo. Up to that time the line had been drawn at

Pittsburgh and Buffalo. We wanted 100,000 tons to come east of there.

I think one point has been confused in your minds. Until January 1 the Equalization Board was handling all of the cane sugar used in the East and was selling it not at 22 cents but at 9 cents, the price fixed by the Government. This beet sugar brought into the eastern territory was brought in and sold at 10½ cents, higher than the price at which cane sugar was then selling, because the cane-sugar price of 9 cents was based on the cost of production and the price arranged for the Government for the whole crop.

The price of the beets was arrived at for the new crop, and it was a high cost, and I will tell you why it was high. After the 1st of January, when the Equalization Board did not control any longer, was when we had that debauch, and it was a debauch.

Senator SMOOT. They had control after the 1st of January. As far as our sugar was concerned they controlled it.

Mr. LOWRY. The fact was they tried to turn the Attorney General into a sugar man over night, and they could not do it. In the early part it was controlled, but not complete.

Senator SMOOT. It was complete as far as we were concerned. About the 1st of January the beet-sugar producers in the West had shipped out all of their sugar with the exception of enough to take care of their local trade. They had to keep that for the local trade.

Mr. LOWRY. Exactly.

Senator SMOOT. And that is what they did do, no matter what they got for it and no matter what conditions may thereafter exist; and the food control took the same position, that they were in duty bound to keep sugar, and did keep it, there in order to supply the local trade.

Mr. LOWRY. Exactly. It was after that that the price of Cuban sugar went up, and the Porto Rican and Hawaiian sugar went up in the same way, when the whole business went up from $11.33 to $22. That is another story.

Senator MCCUMBER. Mr. Lowry's name is down as a witness, and we would like to complete the testimony of Mr. McCormick.

Mr. MCCORMICK. I stated that in May, 1920, they put their price of raw sugar up to the unprecedented figure of 22½ cents per pound, f. o. b. New York. The wholesale price of that sugar, in refined form, f. o. b. New York, went to 26½ cents to the wholesale grocer, and by the time it got to the American housewife she was paying from 30 to 35 cents. As I stated, she was unable to secure an adequate supply even at that price.

Thus, the Cuban sugar manufacturer and the American investor in the Cuban sugar industry who sold their sugars at these extortionate prices reaped a golden harvest of profits beyond their wildest dreams. By their forcing sugar to these high prices they mulcted the American people out of $588,000,000, a greater amount than the duty on all imported sugar coming into the United States at 2 cents per pound duty would amount to for the next seven years. Cuban raw sugar fixes the price of all sugars in the United States. It is not a question of comparing how much more they got out of their sugar in the United States than they would have gotten if they had sold at 6½ cents, but it is a question of comparing how much it cost the United States on account of their pushing up our prices on all the

raw sugars that were imported into the United States. We find that by forcing these prices higher, which they did, instead of our getting our supply from that country at 6½ cents a pound, it cost us something like, I think Mr. Lowry just stated, 11 cents.

Mr. LOWRY. Raw?

Mr. McCORMICK. Yes.

Mr. LOWRY. I said Cuban sugar sold at an average price of $11.33.

Mr. McCORMICK. That has been figured up and that amounts to a matter of $588,000,000 that the American people have been mulcted on account of boosting prices beyond all reason. It is a great amount. As I say, this $588,000,000 is a greater amount than the duty on all imported sugar coming into the United States for seven years at 2 cents a pound. That was the cost in 1920 of this wild debauch—I am glad you gave me the word—of our friends from this great island who were here yesterday asking for assistance.

Supinely indifferent to the needs and welfare of the great American public, and feeling secure that they possessed all of the sugar available for our market, they held back in Cuba a large quantity of sugar for even higher prices. Under these conditions, and attracted by the mountain-high prices, sugars from every part of the world—Egypt, India, Germany, Czechoslovakia, China, Japan, in fact from 41 different countries—were rushed to the United States.

Senator SMOOT. Assisted in every way by the officials of the United States Government, in order to get it here and break those prices.

Mr. McCORMICK. Yes; to help save the people of the United States.

Here is an important point. While but 50,000 tons of such sugars, unnatural to our market, came here in 1919, 880,000 tons of this full-duty-paying sugar were brought into the United States in 1920. Here is a chart prepared by the American Sugar Refining Co., which shows where it came from and the amount. I will be pleased to leave that here.

While the owners of Cuban sugar thought they controlled the whole supply of sugar for this country, they had gone to sleep in their drunken debauch, if you please, to use Mr. Lowry's word. In the late summer they woke up and found that their market was being taken by sugars from other countries. They woke up, too, with a prod from their bankers, who told them to pay their loans, and they began to sell sugar. When they started to unload they found other sugars were flooding the market, and we find, for instance, a decline in these raw sugars from the high price of 22½ or 23½ cents in May to 4½ cents in December of the same year. That was the period when the beet-sugar manufacturers had to come in and market their sugar made in the fall of that year, and we had to market that sugar made from beets contracted for at a price based on the high price of sugar in January and February and March of the spring before.

If this 880,000 tons of raw sugars not natural to our market had not come into this country in 1920, and had Cuba taken advantage of her normal markets and offered her sugar at reasonable prices she would have no abnormal carry-over of sugar on her hands today; she would not now be in financial straits, but would be in a position to demand a fair price for her product.

Mark you, gentlemen, this was not a surplus of sugars of these other countries that came in here. I was in Germany not long ago,

and I could not get sugar on the table of the hotels at any of the smaller towns that I was in. They did not have it. They have no surplus of sugar in Germany, and yet Germany sent over here in that same year 14,000 tons of sugar. Why? They needed American gold worse than they needed German sugar. That is true of a lot of these other countries. There was no world's surplus dumped on us from the outside, as we well know.

I say, had Cuba been less greedy she would be in a position to demand a fair price for her product to-day. In her inordinate greed she pulled her house down on her own head and now comes screaming to the American Congress to extricate her from the débris.

This is the record of the sugar industry of a foreign nation from which we receive a large part of our sugar supply but which is beyond reach of the laws and regulations of our Government and indifferent to the necessities of our people.

Right here, gentlemen of the committee, I want to impress upon you that there is a clear distinction between Cuba as a country and the owners of the Cuban sugar industry. It is a well-known fact that the major part of the sugar industry of that island is owned and controlled by Americans, and the men who are now crying out for sympathy and assistance from the United States Congress are the very men who would not put a dollar into the development of the beet-sugar industry of the United States, which they argue is so profitable, but went over and invested their money in Cuba, where they could exploit the poor dark-skinned native laborer and make sugar for a trifle.

These are the same men who in 1920, when the domestic beet sugar was all sold out by the early months of the year, took advantage of the situation and advanced their prices outrageously to a point where sugar cost the consumer up to 30 cents a pound, thus profiteering on the people of the United States to the extent of hundreds of millions of dollars. Now, because we have in control at Washington the party that believes in protection to American industry and is assessing against foreign sugar a duty which is aimed to equalize the difference in the cost at home and abroad, we find these sucrose-Americans whose investments are in a foreign country, calling upon our Government for assistance for a foreign industry which, if granted, would exactly spell ruin to the domestic sugar industry.

To the judgment of this committee I submit, on the face of the experience of 1920, does America wish to maintain a sugar industry within the confines of our own territory and maintain competition or does she wish to be utterly dependent upon merciless foreigners for the supply of one of her greatest necessities of life.

America wishes to do no injustice to Cuba, and neither does she wish to destroy a great domestic agricultural industry. We believe that a safe solution of this problem rests with Congress.

The people of the United States consume approximately 4,000,000 tons of sugar annually. The domestic beet-sugar industry produces approximately 1,000,000 tons and the domestic cane and insular possessions produce another million tons. By reason of the high standard of living in this country and the consequent higher wages paid, the cost of such sugars preclude them from being marketed abroad in competition with tropical cane sugars. Since Cuba has a 20 per cent preferential in duty on sugars coming into the United

States, she naturally supplies the remaining 2,000,000 tons necessary to make up the total consumption of our people.

For all practical purposes, the foreign sugar costs that are necessary to consider are those in Cuba. The practical question is, therefore, to ascertain the cost of producing sugar in Cuba and the cost in the United States and to determine therefrom the necessary rate of duty to protect the domestic product. As the permanent tariff bill will not become effective for several months, the real question relates to the costs of production for the beet and cane seasons in the fall of 1921.

The United States Tariff Commission in their report, series No. 9, published in 1919, show on page 14 that in the year 1914 the average net cost of producing sugar for 45 Cuban factories was \$1.43½ per 100 pounds, and that the marketing cost, including freight, was 26½ cents per 100 pounds, making the factory cost of the sugar laid down in New York to be \$1.70 per 100 pounds.

I want to say that I have visited in Cuba some of the largest factories down there in 1916, and the manager of one of the large plants told me at his own dinner table that he could produce and sell at a good fair profit his raw sugar, f. o. b. vessel Cuba, at 2 cents a pound. I talked some 90 days ago to a gentleman in New York largely interested in the production of raw sugar. He said, "We will produce our sugar this year at 1½ cents." I want to call your attention to the fact that the reference in this table of the Tariff Commission goes back to 1913 and 1914. Since that time many mills, well equipped and modern, have been built in Cuba and are in operation, and to-day they are in a position to produduce sugar much more economically than ever before and at a lower cost.

The price paid the colonos for cane depends upon the price of raw sugar. The lower the price for such sugar, the less the price paid for cane. Aside from the cost of cane, the principal cost of making sugar in Cuba is labor. The price paid for labor in Cuba to-day is less than in 1914, the date covered by the above-mentioned Government report. At present Cuban sugar manufacturers are paying from 40 cents to 60 cents per day for labor. On the best information we have, we are led to believe that Cuba will produce this year and sell at a profit at least 2,000,000 tons of sugar at \$2 per 100 pounds.

The cost of producing beet sugar in the United States is not difficult to determine. You have got it here in the Tariff Commission's Report during that period, before we had these high taxes, before we had these high railroad rates, before we had these high coal prices. Those things naturally can not be taken as a measure of our cost to-day. I have stated before the committee that the average cost to-day is \$5.05 per hundred, from 16 of the largest producing companies in the United States, and \$6 per 100 in the East. I want to admit that we believe we can produce sugar cheaper than that next year, but since this industry is substantially and primarily an agricultural industry the first item of cost which we must take into consideration in the manufacture of beet sugar is the price which we must pay our farmers for their beets. You can take the record of this commission and see for several years that one thing stands out just like a guidepost; that is, that the amount of money which we pay the farmers for sugar beets constitutes 55 per cent of the

average of our cost of producing sugar. The farmer gets 55 cents out of every dollar it costs us to make sugar. We know, and I don't believe any man will deny it, that if we are to obtain a sufficient supply of sugar beets to operate these factories we must pay the farmers of the United States at least $6 per ton for the beets. No man will argue to the contrary. You can ask farm organizations or anybody else you care to ask, and you will undoubtedly get the same answer.

Taking as our basis $6 per ton to the farmer, that represents 55 per cent of our cost. We follow that through and find that if $6 is 55 per cent of the cost of the 233 pounds of extractable sugar we obtain per ton of beets paid for the sugar will cost us $4.68 per 100 pounds. In order for the sugar companies to pay the $6 it is absolutely necessary that we should get 5 cents a pound net for our sugar, and God knows the difference between $4.68 and $5 is not an exorbitant profit.

I am giving you these figures for the purpose of making you realize how we are to determine the amount of tariff which should be assessed against Cuban sugar coming into the United States.

Senator DILLINGHAM. Will you repeat the statement made about the amount of sugar consumed in the United States annually?

Mr. McCORMICK. About four million tons.

Senator DILLINGHAM. And Cuba is capable of furnishing one-half of that?

Mr. McCORMICK. Cuba, for the last two years, has been producing about four million tons, or enough to supply our total consumption and drive the domestic sugar industry out of business.

Senator CALDER. Where has Cuba been sending her sugar other than what has been brought here?

Mr. McCORMICK. It has been going to European countries. I haven't a list of the countries. The world's markets are open to her, Senator.

I have stated that it is necessary that the beet-sugar companies receive 5 cents a pound in order to pay the farmers $6 a ton for their beets. That would mean that cane sugar would be quoted at $5.20. Take granulated sugar at $5.20, f. o. b. New York. There is a differential of 20 cents a hundred at which beet sugar is sold below the cane granulated.

Now, in order to reach the $5.20 net price for granulated sugar f. o. b. New York, I am going to start with the present quotation on Cuban raw sugar, namely, $2 per 100 pounds, January–March shipment, which is the same as $2.20 in bond price, c. i. f. New York. Add $1 as the refiners' margin between raws and refined and we have $3.20 as the duty-free New York price for granulated sugar. Subtract this $3.20 from the $5.20 New York cane price which must be maintained to enable the beet-sugar producer to secure $5 per 100 pounds for his product, and we have $2 as the required duty per 100 pounds to be levied against Cuban sugar.

It is interesting to observe that this same conclusion is reached if, starting with a $6 per ton price for beets, we determine the cost of production of beet sugar in this country and allow the manufacturer a fair return on his investment. We find that we must sell his product at $5 per 100 pounds net cash, and to enable him to do this it is necessary to maintain a $2 duty against Cuba.

We base our determination as to the cost of producing beet sugar on the well-established fact that the price paid the farmers for beets constitutes 55 per cent of the cost of the sugar.

Using this as a basis, the formula works out as follows: $6 per ton of beets equals 55 per cent of the cost of producing the 233 pounds of extractable sugar from each ton of beets paid for. Therefore, 100 per cent of such cost is $6 divided by 55 per cent, or $10.90. Divide $10.90 by 233 and we have $4.68 as the cost of producing 100 pounds of beet sugar when paying $6 per ton for beets. If this is sold at $5 per 100 pounds, it leaves a profit of 32 cents per 100 pounds, certainly a modest margin.

On the basis of 2,000,000 tons Cuban crop, the net cost of Cuban raws, including a fair profit, is $2 per 100 pounds, f. o. b. Cuba. Add 20 cents for transportation and insurance to New York and $1 per 100 as the refiners' margin and $2 for duty, we have $5.20 per 100 pounds net cash, which will leave the Cuban planter 25 cents per 100 pounds profit.

This makes the Cuban's profit 25 cents per 100 pounds on an output of 2,000,000 tons against a domestic beet-sugar manufacturer's profit of 32 cents per 100 pounds, with sugar selling on a New York cane net quotation basis of $5.20 per 100, which is equivalent to a $5 net beet quotation.

I want to say in closing, Mr. Chairman, as a representative of, not the biggest producers of beet sugar in this country, but as a representative, if you please, of what we might call the modest average-size company, that $2 per 100 pounds under the conditions that Cuba can make sugar, and under the conditions under which we must make sugar, is the irreducible minimum necessary to enable us to continue in business?

STATEMENT OF F. R. HATHAWAY, DETROIT, MICH., SECRETARY-TREASURER OF THE MICHIGAN SUGAR CO.

The CHAIRMAN. State your full name for the information of the committee.

Mr. HATHAWAY. F. R. Hathaway.

The CHAIRMAN. And your residence?

Mr. HATHAWAY. Detroit, Mich.

The CHAIRMAN. And your occupation, Mr. Hathaway?

Mr. HATHAWAY. Manufacturer of beet sugar; secretary-treasurer of the Michigan Sugar Co.

The CHAIRMAN. Will you proceed in your own way to state your views to the committee?

Mr. HATHAWAY. The beet-sugar question, as it relates to the sugar schedule in the present tariff bill, is entirely different from the question as it has related in times past to the sugar schedule in any tariff bill that has ever been discussed in Congress.

Starting with 1890, when we had a production of simply twenty to thirty thousand tons of domestic sugar, which production was not considered sufficient to justify a protective tariff, the father of the bill of 1890 substituted a bounty in place of a protective tariff. From that time on all of the tariff bills have contained a protective feature with reference to sugar. One of them has contained an ad valorem tariff; the others have all contained specific tariffs, th

vowed purposes of all of which, except one—that of 1894—being, in a measure, protection to the domestic industry.

In the consideration of all these tariffs prior to this time we have always been confronted with a condition in which the output of duty-free sugar, plus Cuban sugar, was not sufficient to meet the needs of the United States. Now, for the first time in the history of the United States, we are confronted with an entirely different proposition. Cuba is producing approximately 4,000,000 tons of sugar. The duty-free sugar of continental United States and its insular possessions amounts to 2,000,000 tons, so that the combined output is, therefore, about 6,000,000 tons, of which amount only 4,000,000 tons can be consumed in the United States. This, I say, is an entirely different situation from any that has arisen before in the consideration of the sugar schedule of the tariff bill.

Senator DILLINGHAM. In the 2,000,000 you include beet sugar?

Mr. HATHAWAY. Yes, sir.

The present situation in the sugar industry has been developing since September 23, 1919, when the United States Government relinquished its control of all foreign sugar by advising the American refiners on that date that they were free to buy their raw sugar in the markets of the world. (It subsequently relinquished the control of domestic sugar on August 26, 1920, thus exercising direct control over domestic sugar for 11 months after it ceased control of foreign sugar. It was during that period of 11 months that the extreme high prices prevailed, which high prices applied exclusively to foreign sugar.)

During the period of 15 months which has elapsed since the Government relinquished the control of foreign sugar there has been accumulated a surplus of 1,200,000 tons of Cuban sugar, and nearly as great an amount of domestic sugar. It is this surplus which has utterly demoralized the sugar markets of the world. It must be remembered that the total consumption of sugar in the United States for several years to come can not be more than 4,500,000 tons. If Cuba continues to produce 4,000,000 tons of sugar and the United States to produce 2,000,000 annually, all of which finds a preferential market in the United States, there is bound to be a surplus. You can not put 6,000,000 tons of sugar into a 4,000,000-ton market without utter demoralization. In the midst of that demoralization the cheapest sugar will inevitably supplant the most expensive. In this warfare the sugar of continental United States will be the first to be supplanted. Then the sugar of Porto Rico, Hawaii, and the Philippines will be supplanted. Cuban sugar, because it is the cheapest sugar in the world, will survive. The domestic sugar industry of the continental United States and its insular possessions will be destroyed. The only remedy is a protective tariff which will equalize the cost of production between Cuban sugar and the sugar of continental United States. Keep constantly before you the fact that heretofore, in framing any sugar schedule, it has been possible for the United States to absorb the entire Cuban and domestic crop. This can no longer be done.

We have had 15 months of active competition with the following results: We now have a carry over of 1,200,000 tons of Cuban sugar and a large carry over of domestic sugar; one-third of the entire

capital of the domestic beet-sugar industry has been wiped out; practically one-half of the Louisiana cane industry is on the verge of bankruptcy, and there is complete demoralization of the Cuban sugar industry, with threatened revolution and intervention. Congress must realize this situation and must make such provision in the permanent tariff bill that will prevent our markets from being glutted with the Cuban and domestic product. Congress must decide upon one of two things—viz, whether this domestic market shall be given over to Cuba or whether the United States shall continue to consume the sugar produced in continental United States and its insular possessions and purchase the remainder of its needs from Cuba. Personally I do not believe that Congress will ever permit the passage of legislation which will make it impossible to produce in continental United States at least a war ration of sugar. The experience of this country, and of the world at large, during the last war fully justifies the enactment of fiscal legislation which will guarantee the production within continental United States of at least a full war ration of sugar.

Permit me to call your attention to the fact that a high protective tariff can not work to the disadvantage of Cuba except in one particular. As long as Cuba holds the advantages of a reciprocity treaty with the United States, the 20 per cent concession gives her better protection in the United States market under a high tariff than under a low tariff. Twenty per cent of a $2.50 tariff gives her 50 cents protection against full duty paying sugars, whereas 20 per cent of $1.25 tariff gives her only 25 cents protection against such sugars. The only sugar against which she is not better protected under a high tariff than a low tariff is our domestic product. Any attempt on Cuba's part to lower our sugar tariff is a direct blow aimed at our domestic product.

I have but one other point to bring to your attention, and I hope I may impress you with its importance.

The minimum price at which we can buy beets is $6 per ton. That was the price in the United States in 1916 and in 1917. Back as far as 1912 we paid $5.65 a ton for beets. In view of the increased cost of agricultural production, it is not reasonable to ask the American farmer to raise beets for less than $6 per ton. Whether it is reasonable or not, he will not do it in sufficient quantities to keep our beet-sugar factories in operation. To put these factories in such a position that they can not pay $6 per ton for beets is a direct blow at the American farmer.

The Government figures show that the maximum extraction of sugar in the United States is 240 pounds per ton of beets. A more correct interpretation was given by the gentleman who spoke this forenoon, who set the figure at 233 pounds. But use the Government figure of 240 pounds, and we find that on this basis the factories are paying the farmer $2.50 per 100 pounds for the extractable sugar in the beets. Remember that this $2.50 per 100 pounds represents the price paid by the beet-sugar factories in the United States to the farmer for the extractable sugar and does not include the cost of securing the acreage, the transportation expenses, the cost of manufacture, taxes, insurance, or any of the other expenses in connection with the manufacture of beet sugar in this country. It is simply

e amount the factory pays the farmer for his beets delivered at the ilroad station.

There is a world of evidence to show that the Cubans can lay raw gar down in New York with a fair profit at $2 per 100 pounds. iis has been the ruling price for some time. We pay the American rmer $2.50 per 100 pounds before beginning the cost of manufacture. iat in itself carries all the evidence necessary to demonstrate the cessity for a protective tariff. If we do not have it, these 4,000,000 ns made in Cuba will be sold in the United States, and they will be ld here to the exclusion of sugar made in the continental United ates and its insular possessions. That is the whole question in a itshell.

It is for you to decide the one question whether these 4,000,000 ns which we annually consume in the United States shall be made of 2,000,000 tons which we are raising in the United States and 000,000 tons imported from Cuba, or whether it is going to be ade up of 4,000,000 tons made in Cuba and none manufactured in e United States.

Senator DILLINGHAM. Are you acquainted with the facts relative the cost of production in Cuba and in the Hawaiian Islands?

Mr. HATHAWAY. No; I can not answer that question. There are ntlemen here from Hawaii who can answer that question much etter than I can.

I think that is about all I have to say on this question.

Senator DILLINGHAM. We thank you.

STATEMENT OF C. C. HAMLIN, REPRESENTING THE UNITED STATES SUGAR MANUFACTURERS' ASSOCIATION.

Senator MCCUMBER. Will you state to the committee your views n the tariff duties involved?

Mr. HAMLIN. Mr. Chairman and gentlemen of the committee, I iall occupy but a very few minutes of your time. Indeed, I feel most like apologizing for occupying any of it.

This question seems to have been very thoroughly covered by the ntlemen who have preceded me, and in view of what has already en said about the beet-sugar industry I shall trespass as little as ssible on your valuable time.

There are one or two matters which have been brought out in the scussion of this question, particularly on yesterday, that I would ke to call to your attention.

In the first place, I want to say that I can hardly believe that the ropaganda—I do not use the term in an offensive sense—which is been going on for a 1-cent duty on Cuban sugar is fair. I do ot object to propaganda so long as it is confined to the truth. I o object to the character of propaganda that was put out here sterday with reference to labor in the beet fields of our State. It the same in beet fields and on any farm. I agree very thoroughly ith what Senator McCumber said yesterday, that perhaps our ung men are better off if they have some employment. I might ld that the Government of the United States, in connection with e beet-sugar industry, has recognized this fact to the extent that bys are sent from the Indian schools to the beet fields, under proper

supervision, to help in that work. It is always careful to see that they are back in school at the proper time.

This propaganda is not new. It started some 12 years ago. At that time it was not propaganda for a 1-cent duty; it was propaganda for free sugar. At that time it was not conducted by the Committee on Cuban Emergency; it was conducted as a mythical committee of wholesale grocers pretending to be interested in the American consumer. But it has had but one purpose, and that purpose you will be able to judge of for yourselves if you will take the trouble to read the hearings before the Hardwick committee. You will find that the committee was organized and financed, as I believe this one is, by two or three men. They are the same men who not only put out the propaganda of 1911 but who made good on it by having free sugar written into the Underwood bill.

Most of the questions that have been asked here have been answered, I find by the notations which I have made, so that I shall not repeat them.

In considering the sugar situation in Cuba, I am reminded of the epigram of William Allen White, which appeared many years ago in an editorial that has become famous. The editorial was headed "What is the matter with Kansas?" and in it said that Kansas had started out to raise hell and was suffering from overproduction.

That is the whole question involved in this proposition to-day. We are confronted with tremendous overproduction in Cuba, which has, which will, and which must supply half of our sugar. It is now producing a quantity sufficient to supply all of our requirements. There must be a contraction of the production of sugar so that supply and demand will be, to some degree, balanced; and until that condition comes about there can be no stability in the industry. So the main question which will confront this committee is as to whether that contraction is to come by the elimination of the beet-sugar business in the West and the cane-sugar business of Texas, Louisiana, and Florida, and by the elimination, perhaps—I can not tell because I do not know their costs of production—of the industry in the Philippine and Hawaiian Islands, or whether Cuba shall go back to the prewar basis under which she has prospered and will prosper in the future. I do not think any of us want to injure Cuba; on the other hand, we do not want them to eliminate us.

Senator DILLINGHAM. If we were to eliminate the production of beet sugar here and destroy the industry, what will be the effect with respect to Cuba?

Mr. HAMLIN. I was coming to that. I had that in mind. I wanted to put the question of what the result would be.

Since the beet-sugar business has developed, the United States has enjoyed the cheapest sugar in the world. I think that is practically and literally true, and I do not believe that even Germany would be an exception. There would be an exception in the case of prewar Germany, when she produced a large surplus supply of sugar for exportation. I believe that this supply that we produce here has been the greatest stabilizer of prices of sugar in the United States, and I believe that the greatest calamity that could befall the American consumer would be to have this industry destroyed.

We have heard gentlemen here several times mention the fact that there were certain people who sharpened their pencils on both ends

ien the time comes, as I do not believe it will, that a few gentle-
n seated around a table in Cuba can sharpen their pencils at both
ls and make the price of sugar because they have a monopoly of
I believe the American consumer will be the chief sufferer. I think
it is amply shown by the fact that that condition arose in 1911
l again in 1920, when sugar, after the beet supply was largely out,
e to the stupendous price of 35 cents a pound.

I should not mention this fact had it not been brought out yes-
day. It has a direct bearing on the question you asked as to
king a price on sugar in 1920, when the Louisiana price was fixed
17 cents and the price of beet sugar fixed, first, at 10.5, then 11
its, and, finally, 12 cents. I do not believe that Louisiana that
ar got too much for her sugar, and the fact is that if Cuba had been
itent to market her sugar at that time and at that price she could
ve marketed every pound of sugar which she had, and those
0,000 tons of full duty paid sugar which came from 44 countries,
ne of which rationed their own people on sugar in order that they
ght exchange their surplus for American dollars, would have been
pt out. Cuba, however, was holding back her sugar and has
nked up the supply which is hanging over the market to-day and
reatens to ruin the industry.

The Cuban people and the Cuban Government are in a deplorable
ndition. If Cuba had marketed her sugar at the price which she
uld have received—17 cents per pound—she would have received
r her crop the sum of $238,000,000, which would have saved the
tire industrial and, I might say, the governmental situation.

If the time comes, as I said before, when this domestic industry is
minated and a few men in Cuba, unrestrained by our antitrust laws,
restrained by our Federal Trade Commission, unrestrained by our
ws and statutes, can sit down and name an arbitrary price that the
nerican public shall pay for its sugar, then indeed a calamity to the
nsumer will follows.

Gentlemen, these very questions have been pretty thoroughly
vered. However, a novel argument was advanced to the effect
at American capital having gone into Cuba it should be protected.
ie theory of protection of American capital in a foreign country
ich was advanced was novel to me. I believe that American
pital in a foreign country should be protected. My idea of pro-
tion to such capital is to see that it shall not be destroyed, that it
all not be discriminated against; but to say that domestic capital
rested in a foreign country shall be protected to the extent of
owing our markets open to that which it produces is at least con-
ry to the Republican idea of protection of American industries.

Gentlemen, I believe there is only one other matter to which I wish
refer. Senator Dillingham asked a question, a very pertinent
stion, this morning. I do not think that it was fairly answered.
ppeared from the testimony that was offered here that Cuba was
ucing 4,000,000 tons of sugar, or enough to meet all the demands
e United States. For some reason or other, whenever that state-
was mentioned on yesterday by what I will call our opponents
put the figure at four and a half million tons. As a matter of
during but one year has our consumption reached 4,000,000 tons.
ou asked, too, as to where this surplus would go. That is the
of the whole question. So far as this committee is concerned,

it has not gone. A million and a quarter of it is in the storehouse in Cuba to-day, in hock to the New York brokers. That is the sugar that threatens our market, not controlled by the cost of production, and not controlled by anything. It is the property of an insolvent debtor in the hands of the creditor, and if he sees fit to liquidate his debt it can spell nothing to us but ruin.

Finally, I wish to call your attention to this matter. I must say that I feel like apologizing for calling your attention to it, because I know it is a matter with which you are dealing at all times and with which you are much more familiar than I am. That matter is the value of our trade with Cuba. I do not underestimate it. Our foreign trade with Cuba is valuable. We want to stimulate it; we want to encourage it. But the figures that have been presented to you here are completely and entirely misleading.

Speaking of propaganda, I had before me, as it came across the editorial desk of a little newspaper that I publish in the West, the brief that Mr. Atkins read to this committee on yesterday, in which he gave our exports to Cuba for the calendar year 1920.

Senator WALSH. I think he submitted a table.

Mr. HAMLIN. Yes; the table is here and is undoubtedly correct. It showed that our export trade during that year to Cuba was somewhat over $500,000,000. During the course of the presentation Senator McCumber, I believe, asked if that had not fallen off considerably since the unfortunate depression in Cuba. The answer to that is that for the calendar year ending June 30, 1921——

Senator WALSH. You mean the fiscal year, do you not?

Mr. HAMLIN. Yes; the fiscal year. I thank you, sir. It was a little over $400,000,000. That also is a stupendous figure; but, gentlemen, there are a few things that we must bear in mind in connection with that. In the first place, those exportations were at a time when the cost of everything was at the peak. In the second place the greater portion of those exportations was at a time when Cuba at least thought that she had reached the extreme pinnacle of prosperity and was buying almost indiscriminately. I am not saying this in a critical sense, because our people did very much the same thing. So, taking those factors into account, it would materially reduce these figures under normal conditions.

I will say, further, that for the year 1915—and I am not sure whether this was the fiscal year or the calendar year, but it was the first normal year that I have been able to get figures on—our exports were $75,000,000. It is a large figure. It is a fine trade. It is a trade that should be encouraged and stimulated, so far as we can encourage and stimulate it without the destruction of a great domestic industry. I venture to say that it will not be disputed that that figure is much more near normal than the figure of $500,000,000 which has been presented to this committee. Indeed, I can say that I think from some little investigation of the subject that it is a fair estimate of our export trade to Cuba in normal times.

Bear this point also in mind. If Cuba's whole 4,000,000 tons of sugar were sold at 2 cents a pound—let us say 3 cents a pound, which would give a tremendous profit, since 3 cents a pound would amount to $60 a ton—taking the abnormal production of 4,000,000 tons, it would amount to $240,000,000. That is not their net profit; that is the gross price. To say that a nation whose one product—90 per

cent—represents but $240,000,000 on double the amount they ought to produce, at a price which would give an abnormal profit, has a buying capacity of $500,000,000 is absolutely absurd.

Valuable as the trade of Cuba is, our trade is certainly valuable to her.

In closing I wish to call your attention to the fact that 17 years prior to the reciprocity treaty with Cuba the balance of trade with that island against us was $538,000,000 plus. For the 17 years following the reciprocity treaty the balance of trade against us was $1,298,000,000 plus. So, while $75,000,000 represents a valuable trade and makes Cuba a valuable customer, I should say that the United States, with its 100,000,000 people, is a valuable customer of Cuba's. This is especially true when it is considered that there is a 20 per cent reduction for her benefit in our tariff, which gives her a complete monopoly as against the world on every pound of duty-paid sugar which we consume. Brought down to its essence, Cuba and the United States can both prosper under laws that will permit us to produce half of our sugar and Cuba the other half; but, candidly, in my opinion, there is only one answer, one solution, to this problem, and that is such legislation by the Congress of the United States as will cause Cuba to regulate her production of sugar to the 50 per cent that we can consume plus that for which she can find a foreign market.

I thank you very much.

Senator WALSH. Senator Dillingham, it may be in the record already, but I would like to know how much of the sugar that we consume comes from the Philippine Islands; how much comes from the Hawaiian Islands; how much comes from Louisiana; how much beet sugar comes from this country; how much beet sugar comes from Canada; and then how much is exported from other places.

Mr. HAMLIN. I think I can give you the figures very closely. These are rough figures. The quantitative sugar situation is easily analyzed.

We produce in the continental United States and our insular possessions 50 per cent of our supply.

Senator WALSH. That is, of both beet and cane?

Mr. HAMLIN. I will put it in a little different way. We produce from the beets 25 per cent of our domestic consumption.

Senator WALSH. In the continental United States?

Mr. HAMLIN. In the continental United States. We produce from the cane in the continental United States and our insular possessions another 25 per cent. That leaves—if I am mistaken in my figures some of the gentlemen in the audience can correct me—50 per cent of duty-paid sugar which we must have.

Senator WALSH. Does some come from Canada?

Mr. HAMLIN. If so, it is a small quantity.

Senator WALSH. The rest comes from Cuba, does it?

Mr. HAMLIN. Yes. As to cane production, Louisiana has varied very much. It was reduced when we were confronted with free sugar, as we were. You will understand that in 1915 and, indeed, in 1914, because we were looking forward to the 1915 crop, we approached free sugar with a great deal of apprehension, and Louisiana cut its production considerably. But I should say it would amount to about 200,000 tons.

Senator WALSH. What is the percentage?

Mr. HAMLIN. That is 200,000 tons out of 4,000,000—25 per cen would be a million tons.

Senator WALSH. Of the cane?

Mr. HAMLIN. Of the cane.

Senator WALSH. How much comes from the Hawaiian Islands?

Mr. HAMLIN. About 600,000 tons.

Senator WALSH. That is 15 per cent?

Mr. HAMLIN. Yes.

Senator WALSH. How much from the Philippines?

Mr. HAMLIN. I should say something under 100,000 tons.

Senator WALSH. Five per cent.

Mr. HAMLIN. Two and one-half per cent. In Florida the can business is in its infancy. It is not large, although a sugar mill i being built there. The production in Texas is not large.

Senator WALSH. I thank you very much.

Senator GOODING. What chance is there for the beet growers an the cane growers to increase the production of sugar under the con ditions existing at the present time?

Mr. HAMLIN. Senator, I shall be very glad to answer that questio if I can. What I am about to say may not conform wholly wit what my friends in the beet-sugar industry may believe. My opinio is that we can increase it so that we can supply the entire deman but it is my candid opinion, Senator, that to do that we would hav to hothouse the industry to a great extent in the less favorabl localities and it would require a higher rate of duty than the Amer can people would stand for or than they ought to pay. My opinio is that while the beet-sugar industry, for instance, in your State an in other States will increase, the ratio, due to increased consumptio which we will have, will probably maintain about the proportion th I have suggested. That is my individual opinion.

Senator GOODING. We have to realize, of course, that some of th States in this country have not even commenced to develop that.

Mr. HAMLIN. My idea of that is that the arid States, as you w know, being from Idaho, will be able to develop the industry. I those places where you are bringing in new irrigation projects th beet-sugar business is going to thrive. My expectation is that if w get an adequate tariff they will manufacture at a reasonable cos and that will help settle this market and insure sugar to the co sumer at a reasonable price. My hope is that we may have a logic and reasonable development of the beet-sugar industry and that o increased consumption will take care of that increased supply. I d think that the beet-sugar industry is destined to increase.

STATEMENT OF HENRY T. OXNARD, REPRESENTING THE UNITE STATES SUGAR MANUFACTURERS' ASSOCIATION.

Mr. OXNARD. Mr. Chairman and gentlemen of the committee, I d not propose to take up the time of the committee going over groun which has been so thoroughly covered on this subject, but I sha merely insert a short brief, which I ask be made a part of the recor This is done at the request of the president of the United Stat Sugar Manufacturers' Association.

Senator MCCUMBER. That will be done.

(The brief is as follows:)

In reference to paragraph 502 of the proposed tariff schedule, which provides for the importation of double the amount of sugar domestically manufactured at three-fourths the regular rate of duty imposed on other sugars.

I believe that such a provision would be class legislation and also would be abortive so far as any permanent good to any portion of the domestic sugar industry is concerned.

It would be class legislation for the reason that because of geographical location and prohibitive freight rates there would be no possibility of the great bulk of the domestic producers, especially of beet sugar, availing themselves of any of the benefits of this provision. Most of the beet-sugar factories are in the far West. With the exception of a few factories in Michigan, none of the American beet-sugar factories are near enough to the coast or to the Great Lakes to be able to import and refine foreign sugar.

More than 75 per cent of the beet sugar in the United States is produced in territory west of the Mississippi Valley where the population is restricted. The population in that territory can not consume the sugar produced there to-day, and over one-third of this sugar has to find a market east at a freight rate averaging about one-half cent a pound in order to reach the markets of great consumption. It is evident that no foreign raw sugar can be transported there to be refined and pay freight each way. If this paragraph were in force it would allow those few who could avail themselves of it the opportunity of lowering the market of the western beet-sugar surplus to the extent of the proposed rebate of 25 per cent or force them to restrict their present production. The practical result would be a lowering of the entire benefit of the tariff by 25 per cent of the proposed rate to the western beet-sugar surplus. As a matter of fact, the only real beneficiary of this paragraph would be the American Sugar Refining Co., who operate a very large refinery in Louisiana.

As regards the Louisiana cane-sugar industry, while a slight temporary gain might be made in the price of raw sugar sold by producers to local refineries, because the purchase of such sugars would enable the refineries to import double the amount of foreign sugar at the reduced rate of duty, any slight immediate benefit would be more than offset by the harm which would come in the end.

The influence of such a measure on the beet-sugar industry could not help be positively detrimental, for the reason that if a quantity of foreign sugar be admitted at a lower rate of duty the refiners of that sugar, be they simply refiners or be they producers as well, will be enabled to make a lower price to Mississippi and Missouri River points, which are the main markets for western beet sugar, and even though the quantity be small it would carry down the price of all other sugars reaching these markets. If 50,000 tons of such duty preferred sugars were being marketed at lower prices at these points during the time that a half a million tons of beet sugar were being marketed, the whole 500,000 tons would have to be sold at the lower price made possible by the reduced rate of duty on the 50,000 tons of foreign sugar, and the direct loss on the 500,000 tons would run into many millions of dollars. The tendency of the Michigan output of such sugars also would be to depress the price of all sugars marketed in the same territory.

The present and proposed rate of duty on Cuban sugars is $1.60 per 100 pounds. This article provides for a reduction of one-fourth that rate, or 40 cents per 100 pounds. If the refiners of sugars, without loss to themselves, elected to pass this 40 cents on to the jobbers, to effect the sale of any other sugars this price would have to be met, and this would mean an annual loss of $4,000,000 on 500,000 tons. By skillfully manipulating the distribution of this 50,000 tons of reduced-duty sugars, it might be made to affect the price of even a greater amount than 500,000 tons of domestic beet sugar.

From every viewpoint the effect of the adoption of paragraph 502 would be detrimental to both the domestic beet and the domestic cane-sugar industries, and hence, speaking for a majority of the beet-sugar producers who have requested me to appear in their behalf in opposition to the adoption of this paragraph, I say that the domestic beet-sugar industry is practically opposed to the incorporation of paragraph 502 in the proposed tariff bill.

STATEMENT OF A. E. CARLTON, COLORADO SPRINGS, COLO., PRESIDENT OF THE HOLLY SUGAR CORPORATION.

Senator McCUMBER. What is your residence, Mr. Carlton?

Mr. CARLTON. Colorado Springs, Colo. I am president of the Holly Sugar Co. The Holly Sugar Co. stands sixth in production in the domestic beet industry, producing 1,000,000 bags, or one-twentieth of the beet sugar produced.

Senator McCUMBER. Where are you located?

Mr. CARLTON. We have one factory in Wyoming, two in Colorad and three in California. We represent about the average-cost pr ducer in the industry. We are neither the high-cost nor the low-co producer. We represent about the average condition.

There are two things essential in the beet-sugar industry: One beets and the other is the money to run your plant. Under t sliding-scale contract which we have, a copy of which I should like put in the record, we have paid this year to the farmer so little that is bankrupt.

Senator WALSH. May I ask if there is any one here representing t farmers?

Senator McCUMBER. Only the manufacturers.

Senator WALSH. There are no agriculturists?

Senator McCUMBER. No.

Mr. CARLTON. The beets produced under that contract averag 14 per cent in sugar. You will notice by following that colun down at 5 cents per pound, the minimum price, which is above t price netted this year by our company, we pay the farmer $5.13 p ton. The result has been that the farmers this year have suffered t same experience as the factories. They have had tremendous loss in money. They have not been able to obtain for their beets t amount of cash paid out for labor.

Senator WALSH. How many tons are there to the acre?

Mr. CARLTON. About eight tons in this locality. I think that is fair average for the United States. I should say eight or nine to to the acre.

The farmer is the most important part of this thing, and this is t one product of all that the farmer produces that can be protected the tariff. We produce less sugar than we consume, and you c provide a tariff that will give the farmer a decent price for his bee

Senator McCUMBER. These are all raised on irrigated lands, a they not?

Mr. CARLTON. Yes; in this particular country. In Oregon, course, it is different, and also in Ohio.

The question of finance is a very important one from the facto standpoint. Last year the beet-sugar business of the United Stat lost in the neighborhood of $60,000,000. Our company's losses we very heavy. This year our losses, based on to-day's market for sug will be approximately $1,000,000. It resolves itself into a questi as to how long the beet business may be willing to go along und these conditions. As a matter of fact, the Holly Sugar Corporat will not be able to contract with the farmers for beets this coming ye unless the situation is changed very soon. I am speaking now of t 2-cent raw sugars which fix the price for refined sugar. My ow opinion is that, due to forced sale of bank collateral, the raw sugar w sell in the next 30 days for 1 cent a pound, and that for six months will sell below the cost of the lowest producer.

There is another thought that I should like to present, and that this, that if the beet-sugar industry is to survive the decrease Cuba will require a period of four or five years, at least. It is alwa so after a war. Prices drag along on the bottom from five to sev years.

If it is the purpose of Congress to continue this domestic industry, we should provide, not a temporary tariff, but a permanent tariff, that will cover this readjustment period in Cuba, and that will not be quickly done. It will require, as I have said, from five to seven years.

As to the amount of duty, representing as I do the average-cost producer, I can only say what I said at the hearings before the Ways and Means Committee in January, and that is that we require a duty against Cuba of 2.4 cents. That would result, with a cost of 2 cents raw, and a refining charge of 1 cent, in a price of 5.45 for refined sugar in New York. From this price must be deducted the freight disability of 50 cents a bag to all companies located west of the Missouri River. Our big market is Chicago, and we are under a handicap on an average of 50 cents per bag to the companies located in Colorado, Idaho, Utah, and California. Even with a duty of $2.40 on Cuba, the net to our beet factories would be $4.90. Under this the price to the farmer would be very low and the profit to the factory would be practically nothing.

We do not expect, and are not asking, a profit for the beet-sugar factories during this period. We will be glad to live. As it is to-day, we are broke. Our working capital has been exhausted and the beet-sugar factories that the Holly company owns will be piles of junk next year. We do not care to undertake to make a contract.

Senator WALSH. Did the emergency tariff give you relief?

Mr. CARLTON. Yes; it lessened the loss 60 cents per bag.

Senator WALSH. It succeeded in keeping out some Cuban sugar, did it not?

Mr. CARLTON. No. The Cuban sugar has been choking us.

Senator WALSH. It did not keep out competition altogether, but it kept your losses down?

Mr. CARLTON. Yes. If we had had 80 cents this year, our losses would have been practically nothing.

Senator MCCUMBER. You would have broken even, would you?

Mr. CARLTON. The Holly company would have lost approximately 20 cents a bag.

Senator GOODING. I would like to ask if you are getting any relief from the War Finance Corporation.

Mr. CARLTON. I am glad you mentioned that. The beet-sugar factories, such as the one I represent, would have been unable to function and treat the beets that they contracted for had it not been for Congress providing for the War Finance Corporation. The banks, of course, would not finance us. They know the industry is losing money and they are already stuck.

Senator MCCUMBER. Were you financed directly by the War Finance Corporation, or through the banks?

Mr. CARLTON. They financed us under section 24 of the bill. They financed the Holly Sugar Corporation because we advanced money directly to the farmers. The other companies formed an intermediary finance corporation and borrowed their money from the finance corporation, which in turn rediscounted the paper with the War Finance Corporation.

Senator GOODING. I might say that is the condition of our beet-sugar factories in Idaho. Without the War Finance Corporation I doubt if any of our factories would have harvested their crop at all.

The industry would have been at a standstill. That is the condition with us.

Mr. CARLTON. The unfortunate thing is that the contracting season is at hand. We have to begin to contract in March. It seems a pity that we can not take that product from the farmer. That is about the only product we can. If there were one cash crop we could make available to him, it would be very helpful.

HAWAIIAN SUGAR.

[Paragraph 501.]

STATEMENT OF ROYAL D. MEAD, HONOLULU, REPRESENTING HAWAIIAN SUGAR PLANTERS' ASSOCIATION.

Mr. MEAD. Mr. Chairman, my name is Royal D. Mead. My home is at Honolulu, Hawaii.

I would like to offer a brief on behalf of the Hawaiian Sugar Planters, asking for such a tariff on sugar as will equalize the cost of production between the domestic industry and Cuba.

Senator McCUMBER. Very well. You may file the brief.

Mr. MEAD. There is one statement that I should like to call attention to. It is a statement made by the principal speaker for the Cuban interests. He said that the Hawaiian planters are petitioning Congress for permission to import a large number of Chinese laborers to cheapen their production. The gentleman was mistaken. We have in Hawaii a very acute situation, not only from an industrial but from a political standpoint. From 40 to 50 per cent of our population is Japanese. They have control of the labor situation and they will soon have it in their power to control the political situation also.

The Hawaiian Legislature has petitioned Congress for relief. How that relief is to be granted, whether by allowing Chinese to go to Hawaii or other nationalities, is a matter for Congress itself to decide.

The Hawaiian planters have not asked for Chinese for the purpose of cheapening labor or costs of production.

The gentleman was also mistaken when he said that the Cubans were not bringing in Chinese. Large numbers of Chinese have gone to Cuba in recent years and within the month I read in a Honolulu newspaper of a steamer load of Chinese passing through that port en route to Cuba.

(The brief is as follows:)

The Hawaiian Sugar Planters' Association, representing all the producers of sugar in the Territory of Hawaii, respectfully submits:

As producers of domestic sugar we request the maintenance of such tariff on raw sugar as will equalize the marginal cost of production between the domestic industry as a whole and our principal foreign competitor, Cuba.

We call attention to the fact that in the United States Tariff Commission we have adequate machinery for the accurate determination of relative costs, provided Cuban producers now protesting the existing rate will submit their cost figures for the confidential scrutiny of the commission in the same way as is done by the domestic producers.

We respectfully urge that no change be made in the existing rate, which we believe to be amply justified by present conditions, until the Cuban producers are willing to fill out their cost schedules as requested by the Tariff Commission and the commission has made a comparative analysis of domestic and Cuban costs.

We do not at this time submit any generalized or average figures for consideration of the committee because we have furnished all the information required by the schedules of the Tariff Commission and we believe that generalizations are valueless for comparison within the degree of accuracy required unless made on a uniform basis by a scientific and impartial tribunal.

We are not unmindful of the distress now existing in Cuba on account of the present overproduction of sugar in that island and the impossibility of getting a remunerative return therefor. We allege that in common with other domestic producers the distress in the Hawaiian Islands is just as real as in Cuba, and contend that the suggestion that marginal costs be equalized by the tariff so that the higher cost producers both at home and abroad must limit their production, is more than fair as applied between America and a foreign country, no matter how close our relations with that country.

We submit that the present overproduction in Cuba is in violation of the spirit of the reciprocity agreement, which as shown by the evidence at the hearings in 1902, was designed to give Cuba only a substantial preference over other foreign nations to the end that she might supply all our import requirements.

With the increase in production due to this preferential, Cuba attained in 1913 a substantial monopoly of our import market. We submit that in so far as further production necessitates encroachment upon the domestic market and displacement of domestic sugars it is not warranted by any moral obligation toward Cuba.

As Cuba has officially claimed to be the cheapest sugar producing country in the world, the markets of the world are open to her, and we respectfully submit that no further concessions in the domestic market should be made in the absence of adequate explanations as to why Cuba does not seek the world's markets for her surplus production instead of dumping it on the American market at a loss, forcing a consequent loss on the domestic sugar producers.

LOUISIANA SUGAR.

[Paragraph 501.]

STATEMENT OF JOE B. CHAFFE, REPRESENTING THE AMERICAN CANE GROWERS' ASSOCIATION.

Senator McCUMBER. Do you represent the growers?

Mr. CHAFFE. I speak for the smallest unit of sugar producers in domestic production—the Louisiana cane-sugar industry.

Senator WALSH. Have they an organization?

Mr. CHAFFE. Yes.

Senator WALSH. What is it called?

Mr. CHAFFE. The American Cane Growers' Association.

Senator WALSH. How many members are there?

Mr. CHAFFE. About 400 on the rolls, sir. We are the smallest unit, but we are the oldest sugar producers in America. We have been producers for more than 100 years down there in Louisiana. We have had the usual ups and downs of a man in the sugar business, regardless of whether he be in the continental United States or in the Tropics. Our difficulties have been such as those recited by the witnesses who have preceded. During the year 1920 our losses were, in proportion to our investment, stupendous.

Our friends, the gentlemen from Cuba, say that our investment is negligible, being only $35,000,000. With your permission, and by way of parenthesis, I may say that we are not only manufacturers but we are farmers. We grow 45 per cent of all the cane that we crush, and only 55 per cent is grown by independent farmers on their own lands.

Senator WALSH. And it is from them that you buy the cane, is it?

Mr. CHAFFE. It is from them we buy the cane. Sugar cane is absolutely unmarketable until it has gone through our plant. Our plant stands in exactly the same position to the sugar-cane grower

that the thrashing machine does to the grain grower of the West. We convert part of the sugar into consumption sugar, as we call it. That is our plantation granulated and our high-grade clarified sugar. A part also goes into raws. During the past three or four years the bulk of our crop has been made into sugar fit for immediate consumption; that is to say, it is high-grade clarified sugar. Our investment figures show that we have 600,000 acres under the plow. At a cost of $125 an acre, that would amount to $75,000,000. We have 189 sugar factories, according to the census reports for 1914, and they were appraised at $33,000,000. Our railroad equipment is estimated at $3,500,000. We have 48,000 mules. At an average price of $150—I have not bought any that cost less than $275 in the last four years—their value would be $7,200,000. The implements, wagons, and harness for those mules would, estimating the cost conservatively, be worth $125 per mule, which would amount to $1,300,000. That makes $120,000,000. Our $120,000,000 means just as much to us as the $1,000,000,000 to the men who have invested their money in Cuba.

Again, I represent the only 100 per cent American producing element; not that my friends the beet people haven't laborers in their fields who, as rapidly as they can be amalgamated, will be 100 per cent American, but because we have no influx of foreign immigrants into Louisiana. So I can say that we represent a 100 per cent American industry.

Senator WALSH. How many persons are employed in the industry in Louisiana?

Mr. CHAFFE. Approximately 350,000, sir. That, however, is only a rough estimate as to it.

Senator MCCUMBER. And they are mostly of the brunette type, are they not?

Mr. CHAFFE. We have a great many Creoles—that means white people descended from European parents. The greater number are descended from French and Spanish. Then there are the "Cajuns," white people, the descendants of the Acadians who were driven out of Nova Scotia because of their religious convictions and came to Louisiana. I know of no more honorable representative of that portion of our people than Senator Broussard, of Louisiana.

Senator MCCUMBER. We will readily agree to that.

Mr. CHAFFE. And he is quite as proud of the name as anyone is of his particular nationality.

Senator MCCUMBER. I was really jesting; but I did want to direct attention to the question as to whether or not a large portion of the labor is colored. In other words, there is little white labor, is there?

Mr. CHAFFE. Twenty-three whites to fourteen colored is about the proportion. That is the proportion of the farm operatives in the 23 parishes that cultivate sugar.

I should only be repeating what some of those who have testified ahead of me have said if I were to tell you that there is a club hanging over us in the shape of about a million and a half pounds of sugar that is in Cuba. While we in Louisiana were allowed 17 cents for our lower grades of sugar and 18 cents for our plantation granulated sugar, there was hardly anyone, even a profiteer, who could be found with it, and the Cuban sugar in November of that year was selling, raw, at 9¾ cents per pound. I know, because I happened to be

associated with a purchase of Cuban sugar that was made by a Chicago grocery concern.

Senator McCUMBER. You refine this sugar, do you?

Mr. CHAFFE. Yes; we make it directly from the cane.

Senator McCUMBER. You do not dispose of any of the product except in the refined state?

Mr. CHAFFE. Oh, yes.

Senator McCUMBER. Will you explain about that and the proportions?

Mr. CHAFFE. Recently when we have had opportunity to sell it in the shape of raw and there was no market for plantation granulated and we had to have money to pay the cane growers for their cane, we sold it raw. When we make high-grade sugars, we sell that to bakers and candy makers for general consumption.

Senator McCUMBER. Taking it under normal conditions, what portion of your product do you refine yourself? I am referring now to the entire cane product.

Mr. CHAFFE. I would have to answer that by saying that up to four years ago the margin of difference between the price we could get for raw sugar and the price we could get for plantation granulated made us feel it was to our advantage to get the raw sugar and sell to the refiner, but within the past four years we have changed that condition. Because of the difference in margin, last year we made approximately 86 per cent of our entire crop into direct-consumption sugar, and during this year I anticipate that 60 to 70 per cent of the crop will be made into direct-consumption sugar. Whether that is done directly in our own sugar house or whether, because of the demand of the market to-day for sugars that can not be found fault with at all, the raws are made and then turned into the bone-black plant so that it will give us something that the people will take, it none the less remains the property of the producer until it is turned out of the bone-black refinery.

Senator WALSH. Do you claim that the cost of producing cane sugar is more or less than that of producing beet sugar?

Mr. CHAFFE. More.

Senator WALSH. Does it sell for more in the market?

Mr. CHAFFE. No, sir; sugar is sugar. It does not make any difference whether it is made from beets or cane.

Senator WALSH. It is impossible to tell, is it?

Mr. CHAFFE. I know of no way that it can be told.

Senator WALSH. As a matter of fact, it costs you, in Louisiana, more to put the sugar on the market than it does those who raise the refined beet sugar?

Mr. CHAFFE. We believe from such information as we have been able to gather that that is the case. We do not get so much sugar from a ton of cane as they do in the Tropics.

Senator WALSH. I did not mean the Tropics. I was referring to beet sugar.

Mr. CHAFFE. But we do get more tons from an acre of land than——

Senator McCUMBER (interposing). I had supposed that the price of sugar of a certain degree of refinement would be the same whether it was beet or cane, but I noticed that when one of the witnesses testified for the beet industry he spoke of a differential of 20 cents per

hundred pounds, which I understood him to say was the difference as between the beet and the cane sugar. I may have been mistaken.

Mr. CHAFFE. No; I think you were right. I think you understood him correctly, but I think that is purely a matter of prejudice against the beet sugar rather than a matter that can be established as to availability for the same purpose. I have heard all my life about the difference in the quality as between beet sugar and cane sugar, but I have never been able to find anyone who could tell me of any real difference that existed between the two. One is sucrose and the other is sucrose, and the only thing we have to measure it is the polariscope, which does not show any difference, whether it is made from beets or whether it is made from cane.

Senator WALSH. They are not mixed for the same purpose, are they?

Mr. CHAFFE. Not that I am aware of.

Senator WALSH. Why?

Mr. CHAFFE. I do not see that there would be any advantage in doing that.

Senator MCCUMBER. There would be no occasion for it, would there?

Mr. CHAFFE. I can not see that there would be any advantage gained at all by doing such a thing.

Senator MCCUMBER. As a matter of fact, does the cane sugar sell in market generally for 20 cents per hundred pounds above the beet sugar?

Mr. CHAFFE. Bone-black granulated; yes, sir. Sometimes, because our quality is not as good as theirs, it sells at 10 cents under beet. I am aware of the fact that this year some sales have been made where the difference has been wider than 10 points under beet. But I should say that is the usual rate of difference. I have heard of other cases where sales were made at a wider differential, but that is largely because they wanted the money. In one instance that I remember I had assurance from an individual that he had conceded 15 cents because he wanted ready cash.

Senator MCCUMBER. Does the bone-black refined sugar bring a higher price than the other?

Mr. CHAFFE. Yes. That is the only difference that I know of that you have as between beet granulated sugar and cane granulated. The beet factories do not usually work with bone-black equipment, so far as my information goes. Our plantation granulated is made with bone-black equipment. Then there is the lime and sulphur process. Sulphur dioxide is used for bleaching the juices.

In 1920 our losses were rather heavy on cane because our crops, like those of the beet people, were made on high prices for everything.

As to the details, each item of expense entering into the cost is shown here. We have here the figures showing the losses per ton on the crop of 1920. There are four plantations shown. In the year 1920 they lost all the way from $5.23 to $13 per ton on cane in the agricultural end. You must understand that that is the agricultural operation.

I have here some letters. They happen all to come from the same man, but he happens to be the president of more than one sugar-plant company. These letters show the results of operations in 1921.

uite a number of our plants are still in operation. It is only from iese few that have finished that I could get the figures.

The president of the Evan-Belle plantation states that the cost of roduction has been $73,000, which equals, for planting, cultivating, id other expenses to the beginning of grinding, $5.33 per ton. The arvesting expenses, including cutting, hauling, and delivery to railad, amounted to $1 per ton, and the overhead expenses amounted) $1 per ton, making a total cost of production of $7.33 per ton. .e says that against this they will receive on an average from the ictory $3.85 per ton, showing a loss of $3.48 per ton.

He says that the cost of production on the Evan-Hall property has een $42,329, which includes planting, cultivating, and other exenses to the beginning of grinding, or $3.84 per ton; that harvesting kpenses, including cutting, hauling, and delivery to railroad, mounted to $1 per ton, with the same figure for overhead expenses. his makes a total cost to produce of $5.84. Against this there will e receipts of $3.85 per ton, showing a loss of $1.99 per ton.

The Choctaw plantation shows a cost—this place has no factory, or does it own any interest in any factory—of $4.50 per ton, against eceipts of $3.85 per ton, making a loss of 65 cents per ton. This ı accounted for by the difference in the overhead.

The Cedar Grove Sugar Co. shows a cost of $4.67 per ton as against eceipts of $3.85, or a loss of 82 cents per ton.

These are all strictly agricultural operations.

I have here a telegram saying that the cost for producing cane this ear was $5.60 a ton; the cost of manufacturing, $2.41 per ton; verhead expenses, $1.10 per ton; yields were equivalent to 170 ounds of granulated sugar; the selling price was equivalent to $7.82 er ton; and the net loss, $0.89 for growing and manufacturing. his telegram is from the Sterling Sugar Co. (Inc.). It operated a arge factory to cultivate their own cane, which amounted to approxinately 14,000 acres.

Senator McLEAN. Do you know what percentage of the cost would e labor?

Mr. CHAFFE. About 52 per cent.

Senator McLEAN. What do you pay your farm hands?

Mr. CHAFFE. $1.25 per day.

Senator McLEAN. Do you know what they pay in Cuba for the ame class of labor?

Mr. CHAFFE. I do not know. The only information I have is that I have gathered here.

Senator McCUMBER. Is that $1.25 without board?

Mr. CHAFFE. Without board. If it is labor from some distance— and we frequently have to send to our neighbors for assistance— re usually pay a dollar a day and board. This year it is 90 cents a lay and board. We can not board them for 35 cents a day, but we have to have the help.

The sugar in Louisiana can not be left in the fields. This year we are fortunate in not having any ice to kill the crops. As a result of that cane tonnages are running higher than we anticipated and the sugar content is very much better than the average. We usually get about 138 pounds per ton of cane, but this year we are getting 170, as that telegram states. That is the antithesis of what we had in 1919. In 1919 it began to rain in July; that is to say, it began

to rain in July, 1918, and it rained 120 inches by July, 1919. The result was that that crop was only one-third of a crop. That is why the Attorney General granted the price of 17 cents and 18 cents for our low-grade and high-grade sugars. In many instances that did not cover the cost of production.

Senator CALDER. Is the acreage of cane sugar increasing or decreasing?

Mr. CHAFFE. It fluctuates so with the prospect of free sugar or other vicissitudes attached to the sugar question that it is difficult to say. Of course, in 1915 we began to trim our sails for 1916 free sugar. The crop in 1916 dropped down to about 186,000 tons. The crop of 1919 was not reduced because of premeditation or anything of that sort, but purely because of weather conditions over which we had no control.

Senator CALDER. What I meant was this: Over a period of years has the increase been about the same?

Mr. CHAFFE. About the same.

Senator CALDER. There has been no increase in other parts of the country?

Mr. CHAFFE. There is very little increase in Florida, but I am told they are hesitating about going ahead until they see something that looks like stabilization of the industry. Sugar cane is not like beets. You can not buy a carload of sugar-cane seed and plant it. You have to make up your mind before the first of the year that you are going to plant cane and then cut the stalk. It takes from 8 to 9 per cent or, I should say, from one-eighth or one-ninth of the entire total of cane grown in Louisiana to seed the next crop. We may grow two crops. The land has to be renewed. It is not profitable usually for more than one year.

Senator MCLEAN. It is entirely an annual affair? You cut the stalk?

Mr. CHAFFE. Yes.

Senator MCLEAN. And set them to get the crop that season?

Mr. CHAFFE. No, sir. We begin the preparation of our land in September. We go over the land and thoroughly plow it with a four-mule team or a tractor. We break them deep and pulverize and lay them off and plant the cane, beginning to plant, usually, in the first week of October, but not later than the 10th of November. We put about 5 inches of soil on that land and leave that there. By the 10th of May you can not tell whether the cane was planted in the fall or in the spring.

In the spring, when the time comes to cultivate that crop, the first operation is that of throwing the dirt away from the center. They take the surplus earth off the side so as to have the early sun warm it up and make it sprout. Then you cultivate it in that way until your cane comes up to what we call "coming to a stand." Then you apply your fertilizer to it and bring the earth back to the crop. It is one continuous round of cultivation until the month of May. By the 4th of July we try to get it laid by. Between the 10th of May and the 4th of July it usually gets from three to four cultivations. The average cane crop gets seven cultivations after it has been planted. It is about as intensive cultivation as can be imagined.

Senator MCCUMBER. I take it that weeds flourish.

Mr. CHAFFE. They do, sir. We must keep those weeds down by constant cultivation. We do that. That reduces the amount of

manual labor that has to be done in hoeing the field and cleaning in that way.

In conclusion, we think that if the Government thought that from 1864 to 1890 that 3½ cents per pound was little enough to impose to provide the protection for that industry in the United States that nothing less than that should be the measure of protection given to us now.

Senator McCumber. Are you satisfied with the protection that is given in the House bill?

Mr. Chaffe. Of $1.60?

Senator McCumber. Yes, sir.

Mr. Chaffe. No, sir.

Senator McCumber. What is it that you wish?

Mr. Chaffe. I think we should have 2½ cents a pound.

Senator McCumber. Against Cuba, 2½ cents?

Mr. Chaffe. Yes, sir. If you are going to consider what our necessities are, Senator McCumber, I do not see how you can give us less than 2 cents a pound. I can not see how we are going to get on—that is, against Cuba. Whatever rate you name against anybody else does not mean anything except under such extraordinary conditions as existed in 1920. People are not going to send sugars here when they must sell them at a disadvantage of 20 per cent which the Cuban production enjoys. The only conditions that would bring that about would be that they might find a ship for America when it was impossible for it to go anywhere else.

Senator McCumber. Is there anything further?

Mr. Chaffe. No, sir.

Senator McCumber. The committee is very much obliged to you.

(The documents referred to are as follows:)

St. Claire, La., *December 15, 1921.*

Mr. Joe B. Chaffe,
Care of American Cane Growers' Association,
Union Trust Building, Washington, D. C.

Dear Mr. Chaffe: Knowing that you left for Washington rather hurriedly to appear before the Tariff Committee, and that possibly you were unable to secure all the data on cane cost that you desired to take with you, I take pleasure in giving you the following, as I know you will be glad to receive same:

The costs on our Choctaw property for this year are as follows:

	Per ton.
Planting, cultivating, and other expenses to the beginning of grinding......	$3.00
Harvesting expenses, including cutting, hauling, and delivery to railroad...	.75
Overhead expenses..........	.75
Total cost to produce..........	4.50

Against this we will receive on an average, selling to factory, $3.85 per ton. You will note this will show a loss of 65 cents per ton.

The cost on our Evan Hall property for this year are as follows, based on a production of 11,000 tons:

	Per ton.
Our cost has been $42,329, which equals for planting, cultivating, and other expenses to the beginning of grinding..........	$3.84
Harvesting expenses, including cutting, hauling, and delivery to railroad...	1.00
Overhead expenses..........	1.00
Total cost to produce..........	5.84

Against this we will receive on an average, selling to factory, $3.85 per ton. You will note this will show a loss of $1.99 per ton.

The costs on our Belle Alliance property for this year are as follows, based on a production of 13,700 tons:

	Per ton.
Our cost has been $73,000, which equals for planting, cultivating, and other expenses to the beginning of grinding	$5.3[illegible]
Harvesting expenses, including cutting, hauling, and delivery to railroad	1.0[illegible]
Overhead expenses	1.0[illegible]
Total cost to produce	7.3[illegible]

Against this we will receive on an average, selling to factory, $3.85 per ton. You will note this will show a loss of $3.48 per ton.

The costs on our Cedar Grove property for this year are as follows, based on a production of 12,000 tons:

	Per ton.
Our cost has been $30,232, which equals for planting, cultivating, and other expenses to the beginning of grinding	$2.[illegible]
Harvesting expenses, including cutting, hauling, and delivery to railroad	1.0[illegible]
Overhead expenses	1.[illegible]
Total cost to produce	4.[illegible]

Against this we will receive on an average, selling to factory, $3.85 per ton. You will note this will show a loss of $0.82 per ton.

We trust that these figures will prove of value to you and show the facts of actual conditions in the sugar industry.

Yours, very truly,

CEDAR GROVE SUGAR CO.,
By CHAS. E. THIBODAUX,
Secretary Treasurer.

FRANKLIN, LA., *December 19, 19[illegible]*

JOHN M. ROGERS,
Care American Cane Growers' Association,
810 Union Trust Building, Washington, D. C.

Answering Le Bourgeois wire, our cost sterling organization based on complete figures growing and delivering to factory present cane crop $5.60 per ton of cane. Cost of manufacturing and average freight and loading charges, not including overhead, $2.41 per ton. Overhead expenses, $1.10. Yields equivalent 170 pounds granulated. Selling now $4.60 net plantation, equivalent to $7.82 per ton. Estimated by-products, 40 cents. Net loss 89 cents per ton. Mailed special-delivery statement to-day.

STERLING SUGARS (INC.),

STATEMENT OF JOHN M. ROGERS, REPRESENTING THE LOUISIANA CANE GROWERS' ASSOCIATION.

Mr. ROGERS. Mr. Chairman and gentlemen, before going into the details that I want to put before you I want to controvert a statement or two made by some gentlemen who appeared here on yesterday.

During the war period my friend John M. Parker, now governor of the State of Louisiana, who was food administrator, called me from my home in the country to New Orleans to assist him in that work. He placed in my hands the distribution of the Louisiana sugar to the citizens of Louisiana and the merchants, under the rule of the Food Administration.

There happened to come to my desk one day a gentleman with a request for a certificate for 100 pounds of sugar. I said to him, "Are you a citizen of Louisiana?" He said, "No." I said, "Are you in

business in Louisiana?" He said, "No." I said, "What do you want with that sugar?" He said, "I have a trainload of Chinamen in bond bound for Cuba. They are squealing like pigs for something to eat, and I thought some sugar might quiet them." I said, "We have just made a request of the War Department to permit us to have soldiers from Camp Beauregard who are willing to volunteer to go into our cane fields and there be paid the high wage now prevailing and be under the command of their officers, in the hope that we can save our crop. The laborers from our fields are in the camp or are at the front defending America in this war. I want to say to you, sir, that if your Chinamen continue to squeal like pigs, or if they starve, they will not get any sugar." That is to controvert the statement made by the gentleman who said that the immigration laws of Cuba must conform to those of the United States.

I talked in 1919, when we were in serious straits for labor, with a then member who was well up in authority in the Department of Labor in Washington. That gentleman told me that he was convinced from the data that he had, or information that he had, that there were about 40,000 Chinese in Cuba; that they were coming into Cuba at the rate of 8,000 annually; that those Chinamen were practically brought there under contract. We know that there are trainloads of Chinamen passing every year, even this year, through our cane fields in Louisiana on the Southern Pacific Railway on their way from San Francisco for embarkation to Cuba.

Not long since a newspaper carried reports that a ship was wrecked on the coast of Florida, and following that they found 16 Chinamen in the woods. They came over on their own initiative to get into the United States.

Senator CALDER. They might have been in the crew.

Mr. ROGERS. They were not in the crew, so the paper stated. It was not a Chinese vessel.

This Department of Labor man said that the Chinaman was willing to go through the necessary two years of Cuban hardship in order that he might become a resident of the United States in that way, in his opinion. So much for the practice. There were 250 or 300 Chinamen in that bunch in New Orleans. I was so much interested that I took occasion to look at them.

Senator MCCUMBER. Has there been any scarcity of labor in Cuba?

Mr. ROGERS. I could not tell. I do not think anybody will deny that Cuba brings from Jamaica and various other lands every year laborers for her crops.

A young man in Louisiana, who has charge of one of the Cuban properties, told me that the best laborers they have are Spaniards who are brought over here and returned. They are not citizens of Cuba. He said they are the best laborers they have. A lot of them are stranded in Cuba this year. He said that Cuba has neither the number nor the quality of labor for the harvesting of the crop, and that they do bring them from the islands around about, and a large number from Spain. That was what I was told.

I wish to controvert another statement made here, and that is the statement that the investment of capital in Louisiana production was $35,000,000 and of the beet industry, I believe, $150,000,000. The gentleman took the census of manufactures in 1914, which I have before me. It shows for Louisiana $32,998,000 and for the beet

sugar $142,000,000. But, gentlemen, that applies to factories only and takes into consideration none of the lands, none of the investments in any other things that go to make up the sugar crop.

As Mr. Chaffe told you, our investments, six hundred thousand and odd acres of land in addition to the factories and all the other items, are equivalent to $125,000,000; the Hawaiian investment, I am convinced from investigations I have made, is about $175,000,000; the Porto Rican about $150,000,000; and when you count eight hundred thousand and odd acres of land in cultivation at its value, which the farmer owns but not the beet companies, that that will run close to $600,000,000.

So I am convinced myself that the investment of capital employed in the production of sugar in America and its insular possessions is at least $1,050,000,000.

The Cubans in their original propaganda issued in Washington, I believe it was, started out with only $600,000,000 investment, and that has grown in this short time to a billion dollars. So, if they continue their investments at that rate it will not be very long until their investments in Cuban sugar production will exceed that of the rest of the world.

I want to bring this to your attention, that if an American citizen anywhere had money to invest, and all other things being equal, it is reasonable to suppose that he would invest it in America. Therefore, the reasonable conclusion is that Americans who invested their billion dollars in Cuba for the production of sugar in Cuba invested that money there because they believed that it would make them more money than if they invested it in sugar production in America. Therefore, there has never been a time when an American who had the thought of sugar production and who had a billion dollars was satisfied that we had a sufficient tariff to protect the American industry against the Cuban industry. Hence, those gentlemen put their money where they thought—and facts prove that they were correct—that with a tariff such as would always hamper American production, or, rather, put it the other way, encourage Cuban production, then they would put it in Cuba, where it would pay them the greatest returns.

For the sake of brevity, and to make things simple, I want just to refer to the Cuban rate, and when I use figures, it will be that—and I do not want and will not use abnormal year costs and figures, for the reason that we have had at no time during the war period or up to the moment a time when normal conditions prevailed. Therefore, of necessity, we must go back to what is called the prewar period, or the normal period. For the comparison of costs, I am only going to use Government sources.

The War Industries Board Bulletin 13, Prices of Sugar and Related Products, on page 5, says prewar cost in cents per pound at factory was for Cuba 1.45, Louisiana 3.98.

In the hearings before the Ways and Means Committee, January 18, 1921, Philip G. Wright, of the United States Tariff Commission, testified that the average prewar costs in cents per pound were: For Cuba, 1.70; for Louisiana, 4.480. He afterwards reduced that, as I will show you, to a raw basis. And by reference to Tariff Information Series 16, page 32, and Miscellaneous Series 53 by the De-

partment of Commerce, it is clear that the figures used by Dr. Wright were for sugar delivered in the United States, exclusive of duty.

Miscellaneous Series No. 53, published by the Department of Commerce, says that the average cost of production in cents per pound, f. o. b. factory, Louisiana, was 3.973, and for Cuba, 1.445; delivered in the United States, Louisiana, 3.975; Cuba, 1.719, exclusive of duty.

The Times, of Cuba, published there, and which I have been reading, and it has not been disputed, says in the June, 1921, issue that Cuba has made sugar profitably in former years as low as 1½ cents a pound.

Analyzing these several independent sources—three of them official United States Government, the other Cuban and written in Cuba's interest—we find that to equalize costs we must have the following tariff rates as against Cuba:

War Industries Board: Louisiana cost, 3.98; Cuban, 1.45; the difference to equalize cost, which would be the measure of the tariff 2.53.

The Department of Commerce, Miscellaneous Series 53: Louisiana factory cost, 3.973; Cuban cost, 1.445; the tariff required would be 2.528.

The Tariff Commission, by Dr. Wright: The Louisiana cost of 4.480 and the Cuban cost of 1.70 would be a difference of 2.78, but from that deducts 0.379 cents to bring the Louisiana general line of sugars to a raw basis, and makes the difference 2.401.

The Times, of Cuba: Cuban cost, 1.50, and they say we should have a profit of 1 cent, would be 2½ cents selling.

War Industries Board: Louisiana cost 3.98, a profit of 1 cent would make 4.98, and from that you deduct the Cuban price at which they are willing to sell of 2½, which would leave 2.48 as the tariff required to give Louisiana an equalized tariff. So that on these authorities and from these sources we say to you we should have 2½ cents in Louisiana against Cuba to equalize our costs.

We say, shall it be Cuba and America, or shall it be Cuba alone?

The tariff on sugar as finally fixed in the bill now before you will determine whether it shall be Cuba and America or Cuba alone. A tariff equalizing the cost of production in America and Cuba means continuation of sugar production in continental America at least at the present annual rate of a million tons or more, about one-fourth the amount necessary to supply the American market; it means another million tons produced under the American flag in Porto Rico and Hawaii, the total production on American soil in round figures of 2,000,000 tons, enough to supply half the demand.

It means domestic competition with the foreign production and the refiner of that foreign production. It means cheap sugar to the American consumer because of that competition.

It means, gentlemen, the control and the distribution of sugar will be in many competing hands instead of a practical monopoly controlled by a small number of closely organized seaboard refiners.

The census of manufactures for 1914 shows there were then in operation 241 establishments engaged in the production of Louisiana cane and American beet sugar. There were 18 refiners engaged in refining exclusively. The establishments in the United States now engaged in cane and beet sugar production are distributed in Lou-

iana, through the Middle Western and Far Western States, all in ctive competition with each other. Of the now 20 refiners of raw ugar, according to the 1919 census of raw sugar—that is, imported ugar—the two in California refined Hawaiian sugar, and, of course, an be eliminated.

Senator McLEAN. How does your cost compare with the cost in he Hawaiian Islands?

Mr. ROGERS. Our cost compares with the cost in the Hawaiian slands?

Senator McLEAN. If you are coming to that later, I will not nterrupt you.

Mr. ROGERS. I was not going to deal with the cost of anything but ouisiana, since the Hawaiian representatives are here.

Senator McLEAN. No; but your sugar is in competition with them, nd I was wondering——

Mr. ROGERS (interposing). Ours does not come in competition with Hawaiian other than on the Pacific coast.

Senator McLEAN. Yes; but if they did not produce sugar in the Hawaiian Islands you would furnish the Pacific coast.

Mr. ROGERS. I think the beet would; yes.

Senator McLEAN. Or beets?

Mr. ROGERS. Of course, the Hawaiian cost is less than ours.

Senator McLEAN. If you stopped producing it, we might have to go to the Pacific coast to get some of our sugar. I was wondering what the difference in cost of production was, in a general way.

Mr. ROGERS. I have not that in my brief, and I would have to refer you to the Hawaiians for that.

The establishments in the United States who are now engaged in cane and beet production are distributed as I said.

Of the now 20 refineries of raw sugar, 2 in California are refiners of Hawaiian sugar, the other 18 are on the Gulf and Atlantic seaboard, and chiefly engaged in refining Cuban raw sugars. They do refine Porto Rican sugars also, of course.

A schedule of refining capacity prepared by the refiners' committee for the Federal Food Administration in 1918 shows for the two refiners of Hawaiian sugar on the Pacific coast a capacity of 10.494 per cent, leaving 89.506 per cent of the capacity engaged in refining imported raw sugars, mainly Cuban sugars, on the Atlantic seaboard, and confined to 18 refiners.

The combined refined capacity of these 20 refineries is generally conceded to be 50 per cent in excess of the American requirements. The American Sugar Refining Co., in both its 1919 and 1920 annual reports, says: "For many years there has been an excess refining capacity in the United States sufficient easily to meet all domestic requirements, and to refine at least a million tons for export."

Of the 100 per cent refining capacity, as shown in an exhibit I have here, No. 4, seven of the eastern seaboard refiners, with a combined refining capacity of 68.324 per cent of the whole, through ownership or by control, control either directly or through their directors or officers a very large Cuban production.

Eliminating the two Pacific coast refiners, they being refiners chiefly of duty-free sugar from insular possessions, of the remaining 18 refineries having 89.506 per cent of the total refining capacity, seven of these refiners controlling Cuban production represent 76.33

per cent of those engaged in refining Cuban sugars. In the production of of the 1921 Cuban crop there were in operation 192 centrals having a combined production of 27,442,218 bags. The ownership of centrals and production in bags of the national ownership was: American-owned centrals, 69; production, 2,055,590 tons. That is more than the normal prewar production of Cuban sugar and enough Cuban sugar to supply the deficiency between the domestic production and the Cuban; that is to say, that if the properties affiliated with the refineries on the seaboard were the only ones producing sugar in Cuba, then, in that event, they would produce enough to supply our Cuban demand. Now, the Cuban so-called, produced 1,177,138 against their more than 2,000,000.

The Spanish ownership was 440,837 tons; the British was 80,720; the Cuban-American was 82,897 tons—that is to say, the Cuban-American such as are called Cuban-American; the French was 29,802 tons; the Cuban-Spanish was 24,351; and the small amounts for the British-American and Cuban-Italian.

The nationality ownership, measured by that production, showed 52.62 per cent American.

The figures are taken, gentlemen, by going to Poor & Moody's Manual of Industries and finding the American refiners and their stockholders and directors, then taking each of these individual Cuban companies and finding the same, or some of the same, directors and stockholders; the directors, officers, and stockholders of those Cuban companies; and I am limited to that.

Therefore, my statement that only 52 per cent is Cuban as against the statement of the gentlemen who represented those interests here of 60 per cent. I can easily accept theirs, because I was limited to actual facts that any one of you can get for himself.

The Cuban production, so-called, was only 30.152 per cent, etc.

Furthermore, the best equipped and the highest producing factories in Cuba are the American-owned factories. The American factories average 208,538 bags per factory; the Cuban factories only half that, or 104,355 bags; the Spanish, 114,291; and all others an average of 90,610 bags.

Senator McLEAN. Has the price of land suitable for growing cane in Cuba increased in the last 5 or 10 years?

Mr. ROGERS. I could not answer that for Cuba. I can say this, however, that each one of these American companies that is listed in Poor & Moody's Manual, almost without an exception, recites the fact that they have a great many acres of cane land not yet in cultivation for sugar. Their potential production is fully equal to the total production of Cuba to-day.

Of the 89 American-owned centrals in Cuba, 51 are American refinery products. Either by ownership, lease, or control, these 51 centrals produced 11,716,928 bags, being 81.43 per cent of the total American ownership of Cuban production, or 42.69 per cent of the entire production of Cuba. In addition to this there should be added the ownership by Hires, Hershey, and Loft, American soft-drink and candy manufacturers, and four centrals producing, in 1921, 470,841 bags additional.

This data, as I said, was secured chiefly from Poor & Moody's Manual of Industries, and is restricted to those listed therein. If full facts were available, we believe most, if not all, of the remaining

merican-owned centrals could be shown as connected with the sea-oard refineries. We think it reasonable to assert the further belief hat a large number of the centrals whose ownership is given as Cuban ome in the direct sphere of influence of the refiners, either by stock oldings, by being financed, by transportation control through owner-hip of railroads, docks, etc. A large portion of this centralized con-rol has been perfected within the past six years, much of it within hree years, and the process is continuing. Indications are that aajority control of Cuban production is now, or soon will be, in the ands of the refiners on the eastern seaboard, who will then name the rice of Cuban raw sugar, the price to be paid the native Cuban for is production.

With such a large control of Cuban raw sugar production with qual control of American refining, unless continental production nd refining competition is maintained by a tariff that equalizes he American and Cuban production costs, not only will the American roducer be forced out of business, but the native Cuban as well. t is a well-known fact that the only competitor of the seaboard efiner or the producer of Cuban sugar is the sugar grown under the American flag. Cuba has no other competitors for the American market. The 20 per cent tariff preferential accorded Cuba is ample n amount to shut out the only other country in the world that can approach Cuba in production cost, that is Java. In addition to the tariff preferential, in the American market Cuba has other certain economic advantages over Java. Java is 75 days away from New York and Cuba is 7 days. Java's freight rate is, of course, very much higher and her production cost, from best available figures, is certainly not lower than Cuba. So she starts out on an equal basis there.

I would say that with no preferential——

Senator McCUMBER (interposing). Mr. Rogers, I will ask you that where you have figures and tables, if you can not present them, because it is difficult for members of the committee to ask any one to condense what they have in mind—I know how difficult it is myself; but I do want you to realize that there are a great many others coming on, and what you can put in without going into detail we wish you would do it so we can get through.

Mr. ROGERS. I will do that. I shall not refer to these tables.

With no preferential tariff whatsoever, Cuba would hold the American market against all foreign countries. Putting sugar on the free list would not make any difference to Cuba so far as competition in the American markets as against foreign countries. The preferential tariff of 20 per cent gave Cuba an added advantage of 25 cents per hundred pounds in the Underwood bill. In the present emergency tariff of 2 cents general tariff, Cuba with a preferential of 20 per cent has an advantage of 40 cents per hundred pounds. This is her profit. In addition her competitors have to add their higher freight differential to this. With a general tariff of 2.50 cents, Cuba would then enjoy, under the 20 per cent differential, 50 cents per hundred pounds. With a tariff of 3½ cents, the Cuban would be 2½, an advantage of 62½ cents. Her preferential freight and tariff profit would enable her to deliver to American refineries at an insurmountable advantage over any foreign sugars. Cuba needs no preferential to give her the American market. Cuba does not want a greater

preferential than the 20 per cent. She plainly states her only desire as being a tariff rate not exceeding 1 cent. For what purpose does she want this?

Cuba's sole competitor in the American market is the producer of sugar under the American flag. The seaboard refiners' sole competition is still more narrowly restricted to the beet production of the Central and Western States and the cane sugar of Louisiana, and she says in her propaganda issued August 15 a tariff such as asked for is to simply tax the American consumer to stimulate the refining industry; in other words, the American public would be paying a higher price for sugar in order to stimulate the beet-sugar industry in this country, which would eventually control sugar prices in the United States. And they do not want any protection or need any protection against anything except that produced on American soil and under the American flag.

This continental production being from field to finished product is within itself widely distributed as to ownership, as shown by Exhibit No. 3, therefore highly competitive, whereas the Cuban production, being more than 60 per cent American-owned, and that ownership restricted to 69 corporations, practically, if not actually, all a part of or closely allied with the refiners on the Atlantic seaboard, places the control of the Cuban production and price in monopolistic hands. The sole and only reason why the Cuban supply from the cane in the field to the refined sugar for American consumption, is not wholly controlled in volume and price by the seaboard refiners is the producer of beet and cane sugar under the flag of the United States of America. These producers do not expect or desire to supplant the normal Cuban raw-sugar production nor its sale to or refining by the seaboard refiners. We expect under any conditions, any tariff named, to continue to have the competition of Cuban sugar and the seaboard refiner. We only desire fair and equitable protection. Let it be Cuba and America.

A low tariff on Cuban sugar would completely destroy the continental producer. A short, sharp campaign of controlled shipments and prices would soon destroy any native Cuban who dared offer to oppose this giant monopoly by the independent production and sale of sugar. There would simply be no one to buy his sugar. His lands and factories would pass into the hands of the same interests that controlled the American sugar supply. The native Cubans' only alternative would be that of nothing more than a wage earner for the American owner. The American consumer would pay for his sugar whatever price the combination of refiners saw fit to fix after destroying all competition. It would make no difference to the refiner whether his profit be named in the price of Cuban raw sugar or that of the refined article. Being all this, he could fix either to suit, the result to him being the same profit in either case. To the American public it would mean a noncompetitive market, and inevitably higher price. A tariff insufficient to continue and encourage American production would cost the American public more money in a short period of time than all the revenue ever collected under a tariff that would equalize costs. A tariff-equalized cost would mean a continuation and extension of American production, and profitable returns to cheap producers. The American producer only asks fair and equitable consideration. Let it be America and Cuba

An insufficient tariff on sugar simply means to turn over to Cuba the entire source of sugar supply for the American market. In doing this there would be the equivalent of confiscation of the large capital invested in the 89 factories producing beet sugar and the 189 factories producing Louisiana cane sugar, and a complete change of crops and business methods now employed in sugar production in America. Sugar producers of Louisiana have been trained for generations in this highly specialized line of agriculture and manufacture. The great majority of them could not readily readjust themselves to other lines. Even were it rearranged only the fields now given to the production of sugar, it would simply mean the bringing into competition with the already overcrowded and over production of rice, corn, wheat, beans, and live stock in the United States. Would this be a good economic practice?

Cuba claims that there is invested in lands, factories, and equipment to produce sugar on the island more than $1,000,000,000 of American capital. The investment under the American flag—a conservative estimate—shows: For beet sugar, $600,000,000; for Louisiana cane, $125,000,000; for Hawaii, $175,000,000; for Porto Rico, $150,000,000, or a total of $1,050,000,000.

Capital that employs American labor at a fair wage, pays its proper share for the support of the American Government and institutions, National, State, and county; invest its money on American production and American soil, ships over American railways, buys American produce and manufactures, invests in American enterprise and deposits in American banks. The seaboard refiner renders a minimum of service, employment of labor, and in distribution of capital.

No one takes seriously Cuba's undignified taunt that she increased her output at the request of the Allies. She used her enormous war profits to increase her output for the sole definite purpose of dominating the American sugar market, destroying by the might of the power of her enormous production at so much lower cost than the American producer could, that she thought she saw certain destruction of the American producer, particularly the beet producer of the West. She showed by her act that she intended to ultimately supply all America's requirements and much of the balance of the world. American production remained normal. Not so Cuba.

I want to call your attention to this fact hurriedly, that Cuba has purposely and definitely—and when I say "Cuba" I refer particularly to American capital invested in Cuba—gone forward in the increase of her production, knowing that normally there could not be more than a consumption of 2,000,000 tons, and to show what they did on that, in spite of the fact that we maintained in America practically without material change our same amount of production, knowing the same thing, and we did not try to supplant Cuban beets, or Louisiana, or anybody else, and yet they have definitely tried to supplant us.

The American crop in 1913, as compared to the Cuban crops, 1917–18, increased 14 per cent; but the Cuban crop in the same period increased 42 per cent. But if you take the crops of 1912–13 and compare—that is, American to that of 1920, our increased production was 4.8 per cent—I mean the total American, both Hawaiian and Porto Rico included. Whereas if you take the Cuban

production of 1912-13 and compare it with 1920, it is 53 per cent. You take the Cuban crop of 1921 and compare it with the period o 1911-12, you will find that they had increased 105 per cent. When the total American production increased 16 per cent.

So that we, recognizing the fact that we had a market for on half the production endeavored and did produce that half. Cub produced that half and twice as much more. I will not go over th fact of extravagance and bad judgment in the holding of Cuba sugars by them, because that has been gone into.

I want to call your attention briefly to what the American re finer means to America, leaving out the fact that his money is i Cuba. The 241 establishments taking the census of 1914 listed a raw cane and beet sugar producers, separating Continental suga production from the raw products, beet and cane; we take cane. \ per cent, mature and turn out 12 per cent of that of sugar, a pr duct that is finished, and we pay all the expense for doing tha The American refiner turns out to you 4 per cent of service in takin in 96 Cuban sugar and making it into sugar. On every item i 1914 census, they took those represented by the volume of suga handled by establishments by producing a sugar direct from ca and beets grown in Continental America exceed like items of th refiners of foreign sugars.

This question was asked awhile ago, that probably will fit int that: Of the 3,560,147 tons of sugar going through refineries- that is, the American cane grower and the seaboard—2,463.3 tons came from Cuba and 936,376 from our insular possession 11,732 tons of full duty sugar while handling less than one-thi the volume of sugar as is expressed by the refined figures, the Amer can cane and beet sugar factories paid for salaries, wages, and lab $831,152 more than the refiners; they paid $27,975 more taxe they added to the value of the raw product $1,569,564 more tha the refiners. In addition to this, the entire $57,357,579 paid f raw material was paid out in America to Americans for cane an beets produced on American soil. The total paid out for America production, labor, and taxes, was $69,605,641. The refiners pai out for American production, labor, and taxes during the sam period, $11,288,935. Our refiners added 50 per cent to the valu of raw material, and the refiners less than 10 per cent.

Therefore, I say to you, gentlemen, that this fight I can best liken for illustration, to this condition: That if the "Big Five" me packers, so called, owned in the Argentine enough land to supply a the beef needed in America, and in addition to that enough more lan to double that, that they were not yet using, and they took that be and put it into such condition that when they brought it to Americ they only had to take 4 per cent of waste material from it, knowin as we do that they can produce that beef down there at least $10 head cheaper than we could here, then the American farmer and be grower would be just as the American sugar grower is to-day.

The same thing would hold true if the eastern woolen mills owne Australian lands and sheep—you could carry that on through th Argentine in wheat. That is our condition to-day, and there is no any use in masking this thing, gentlemen. This is strictly an wholly a fight on the part of the American investor in the America refineries and in the Cuban raw product, who believed that he coul

vest his money in a foreign country and that a foreign country uld get more returns from the capital invested than he could if he vested it in America. There is no thought on the part of the most the men who are making this fight of any sympathy for or protecon to the native Cuban, and there is certainly none to the native nerican, and we say to you that also interests directly the conmer, because if that were created because of such insufficient riff levied against Cuba as would put out of business the American nsumption, then in that event these American owners owning th the raw sugars in Cuba, which are not amenable to the laws of nerica, and the refineries on the seaboard, the price to the American nsumer would be higher than it will ever be under any tariff that u may fix.

I am confident that a vote for a tariff that will equalize the cost American production will be not only a protection to the American gar industry but will be a direct protection to every consumer of gar in America.

The claim that the passage of the emergency tariff act caused i immediate decline of 60 cents per hundred pounds does not hold ith the statement made later in their presentation that the increase tariff "would have to be paid by the ultimate consumer." The ss set forth in the figures is a purely hypothetical one. If she was lling at a certain price, any price will do, and the market declined) cents per hundred pounds, then her loss on a given number of ags amounted to so many dollars. Cuba's loss, if any, is the ifference between the cost of production and the price the sugar lls for. Their statement is a hypothetical one and not "actual ss." The market could and did decline only because Cuba in her reed produced sugar far in excess of the normal and then held her rerproduction for a fictitious price wholly unwarranted as based n cost to produce, and through her act causing large volumes of ll-duty sugars to come into the United States, supplying the emand, creating an added surplus, and by her act causing the merican producer, who was content to and did produce a normal rop and sold his crop at a reasonable price based on the cost to roduce; Cuba carried down with her the American producer of the ext succeeding crop.

Cuba's profits on the sugar actually sold reveals a return to them r the three years that is almost staggering. In addition to the cknowledgment that Cuba can produce sugar cheaper than any ther country might have been added the geographical advantage nd the existing preferential allowed Cuba for the American market. rom separate sources, all practically in agreement, treated from ifferent viewpoints yet all giving practically the same result, we ubmit that 1 cent tariff is not sufficient to equalize costs for Louiiana. It should be not less than 2.50 cents against Cuba. In the uban presentation the careful disregard to prewar costs is truly ngenuous. Normal economic, commercial, and productive periods re the only ones that disclose true facts. Since 1913 no such ormal conditions have prevailed; therefore comparison to be just ust be placed in the prewar period.

Cuba boasts that "since the conclusion of the reciprocity treaty f December 11, 1902, was signed there has been no change in the uban tariff.'' She tells only half the story. The reciprocity treaty

itself contains the following clause: "*Provided*, That while said con-vention is in force no sugar imported from the Republic of Cuba and being the product of the soil or industry of the Republic of Cuba shall be admitted into the United States at a reduction of duty greater than 20 per centum of the rates of duty thereon as provided by the tariff act of the United States, approved July 24, 1897." The act of July 24, 1897, referred to provided a duty of ninety-five one-hundredths of a cent for sugar testing not above 75° by the polariscope, with thirty-five one-hundredths of a cent for each additional degree, which is equivalent to 1.685 cents per pound 96° sugar. A preferential of 20 per cent gives Cuba a tariff on this of 1.34 cents. Cuba accepted this provis andwas signatory thereto. Yet we find this agreement violated by th United States in the passage of the Underwood tariff, reducing th general tariff to 1.25 cents per pound, 95° basis, with the 20 per cen preferential to Cuba, making the tariff rate against Cuba 1 cent pe pound. No; Cuba has never favored America with any reductio in her tariff, yet she accepted this gratuity to her chief produc sugar. She boasts of never having reciprocated this. No; Cub knew when she signed the treaty and knows now that the higher th general tariff, the greater her protection to the American marke Cuba knows she has full possession of the American market for th normal, proper crop of sugar. So far as the citizenship of Cuba i concerned, there need be no fear as to the disposal at a fair pri of their sugar production. It is not the volume of the America tariff that has placed Cuba in her present position. It is not th volume of any American tariff that ever will be fixed that endange the citizenship of Cuba or the production of sugar in Cuba by he citizens. It is the American capital invested in Cuban productio the major portion of that capital and its Cuban investment bein owned, controlled or directed by the same men and corporatio that own, control and direct the American seaboard refineries. Th protest is made in Cuba's name. "The voice is the voice of Jaco but the hands are the hands of Esau." Another birthright is fo sale. The native Cuban citizen is to be the Esau. Who is th "Cuban producer"? From sources quoted we find the followi statistical data:

Of the 14,389,128 bags produced by American capital, 11,716,9 bags, or 42.69 per cent of the total Cuban crop, was produced b dividuals or corporations, owners, directors, and stockholders erican seaboard refineries. This explains with clearness the pecu r arguments advanced and the final admissions in the memorandu submitted by the Cuban commission. The direct charge that th only competitor that Cuba has or fears to have is the producer sugar in the continental United States and her insular possessio In her further attack on the producer of sugar under the Americ flag, she entirely removes the mask and plainly eliminates the can sugar production. While making a general inclusion of Louisian Porto Rico, and Hawaii, she openly directs her attack on, and co comparison to, beet sugar. Here again the hand of the seaboa refiner is shown. All the sugar produced in Porto Rico and Hawa is refined in American refineries. A part of the Louisiana sugar sold as raw sugar to the refineries. These same refineries that ow or control directly practically 50 per cent of the entire Cuban pr duction, it is altogether conceivable that a large portion of that wi

which their names are not officially connected is likewise under the domination of the refiners. The beet sugar produced in the United States is refined by the American beet factories. Their production amounts to nearly 1,000,000 tons annually, almost one-fourth of the total American consumption, coming in direct competition with the seaboard refiners. Given the tariff asked for in Cuba memorandum, the combined seaboard refiners of the United States would bring about the following results:

First. They would increase their Cuban holdings; take the birthright of the native Cuban; eliminate entirely any Cuban sugar producer who dared refuse their terms.

Second. With their present power made complete by the lowered tariff, adding thereto the excess power of ownership or control of all Cuban production, the sugar producer in insular America would be at the absolute mercy of these seaboard refiners. Prices paid the insular producer would be whatever the seaboard refiner named. He would produce or cease production at the will of the seaboard refiner.

Third. The Louisiana producer would be forced to discontinue the production of competing grades of sugar, then summarily crushed out as unworthy to exist; his sugar mills a total loss, just as truly confiscated as by a war of armed conquest.

Fourth. The combined refiners would then turn their attention to the destruction of the beet producer. Refined sugar for a short period of not exceeding two years, would be sold at the lowest price the world has ever known. Beet fields would be turned to the production of beans, wheat, and other cereals, adding to the already disastrous overproduction of these farm crops.

Fifth. This conquest completed, the seaboard refiners, owning or controlling the entire Cuban production, owning outright the exclusive refining power of the United States, the price of refined sugar would begin to rise, and in two or three more years the American sugar consumer would be paying the highest price ever paid for sugar in normal times. The Cuban production would be increased to that amount just at or below the amount the American consumer would absorb and refiners export.

Sixth. There would be no competition from Java or anywhere else in the world. The seaboard refiners having control of the raw Cuban production and the American refining, no other capital would have the temerity to risk their money in investments to compete with such a combination. Owners of the cane fields and the beet fields of America would not dare again planting their acres to sugar-producing crops, however alluring the price being then received for sugar appeared.

Seventh. During this time America would be losing $50,000,000 to $125,000,000 according to volume of tariff, per annum revenue at the customhouse, all of which, after the period of destruction which carried down the American production, elapsed, every dollar would go to the refiners, the American public paying more in the advanced price than any tariff conceivable.

Eighth. This process completed, this combination of Cuban-producing, American-refining, both controlled, the next step, and that sure to come, would be the appearing of this interest before Congress asking the entire removal of all duty on Cuban sugar. The interests

owning both the production and refining could easily transfer thei profits to the raw sugar in Cuba, always showing narrow margins o refining profits. To avoid American laws, they might even appea in fierce competition, eliminating any showing of profits from refinin if need be. Not so the price of raw sugar in Cuba. Our laws coul not reach them there. No further hint of revolution in Cuba, n veiled suggestion of annexation, no other move that would mak them amenable to the laws of the United States.

This is no idle dream, but a logical conclusion, forecasting exactl what will happen if the plea made in Cuba's name be granted. Fo the sake of the American consuming public, for the saving fron practical bondage of the rank and file of the native Cuban, the lo colono or small farmer, the laborer, to save Cuba from herself, fo the sake of the producer of American cane and beet sugar, to trea fairly the American producer, this Congress in its wisdom will declin this request of the Cuban commission and instead thereof fix a fai and just tariff on all outside sugar that will equalize the cost o producing American-grown sugar with that of any other countr anywhere. Thus will this great industry on American soil continue competition in the sugar market be assured, fair prices maintaine to the consumer, and the most equitable and just revenue paid t the support of the American Government by any commodity imported.

(Exhibits submitted by Mr. Rogers are as follows:)

American and partly American-owned factories....	43	64	[illegible]
Per cent American and partly American factories of total....	24.43	34.04	[illegible]

The table shows that in 1913–14 36.45 per cent of the total tonnage of sugar w produced in American factories; in 1914–15 American production increased to 4 per cent and in 1915–16 to 49.31 per cent of the total.

The average tonnage of American factories was 27,893 tons in 1913–14, 23,946 to in 1914–15, and 20,060 tons in 1915–16, as compared with 13,590 tons in 1913–1 11,460 tons in 1914–15, and 13,824 tons in 1915–16 in all other factories.

Of the factories producing from 50,000 to 100,000 tons of sugar there were 6 Amer factories in 1914 producing 458,675 tons, or 76,449 tons per factory; 8 American fa tories in 1915 producing 480,863 tons, or 60,108 tons per factory; 9 American factor in 1916 producing 605,594 tons, or 67,288 tons per factory, as compared with 2 fact of other ownership in 1914 producing 104,102 tons, or 52,051 tons per factory, an 1 factory of other ownership in 1916 producing 56,800 tons of sugar.

[1] Same as notation in preceding table.

The 241 establishments listed as raw-cane and beet-sugar producers represent [illegible] tinental American sugar production from the raw products, beet and cane. Th[e] refiners represent chiefly the imports of foreign raw sugars.

On every item except those represented by the volume of sugar handled the [esta]lishments producing sugar direct from cane and beets grown in continental Am[erica] exceed the like items of the refiners of foreign sugars. Of the 3,560,147 tons of [sugar] going through refineries in 1914, 2,463,303 tons was from Cuba, 936,376 tons duty [free] from insular possessions, 11,732 tons full duty sugars (carry over from prior dat[e prob]ably accounts for small balance). While handling less than one-third the [total] of sugar as expressed by the refined figures, the American cane and beet sugar fact[ories] paid for salaries, wages, and labor $831,152 more than the refiners; paid $27,[illegible] taxes; added to the value of raw material $1,569,647 more than the refiners [In] addition to this, the entire $57,357,579 paid for raw material was paid out in Ame[rica] to Americans for cane and beets produced on American soil. Total paid out [for] American production, labor, and taxes, $69,605,641. Refiners paid out for Americ[an]

production, labor, and taxes during the same period $11,288,935, at the same time paying out for foreign sugar alone $247,086,355. Even in service performed in factory operation alone the cane and beet producers added $26,883,004 value, or nearly 50 per cent, to the American raw material; this for only one-fourth the total American consumption of that material. The refiners, with more than three times the volume, only added $25,315,357, or about 10 per cent, clearly demonstrating the small service performed, the foreign producers receiving the lion's share of money paid out.

If no other reason was advanced for a tariff on sugar equalizing the cost of production in America against these foreign sugars, they should pay revenue sufficient to properly compensate the American Government for the market demand it furnishes. In lieu of the small service performed, the minimum of capital distributed to American labor and in support of the Government, this foreign sugar should pay an entrance fee for the privilege enjoyed to in a degree approach the American who performs the same kind of service and has to compete with the foreign article. An increase in the tariff against Cuban sugar should be levied this amount, regardless of any effect on American sugar production.

EXHIBIT No. 10.

Exports of sugar-mill machinery to Cuba.

[Monthly Summary of Foreign Commerce of the United States June, 1920, and June, 1921.]

Article.	12 months ending June—			
	1918	1919	1920	1921
Sugar-mill machinery (value)	$11,760,246	$10,132,593	$15,471,518	$29,106,909

Exports of sugar-mill machinery to Cuba for the 6 months ending June, 1921, $7,269,465. (Department of Commerce figures.)

Domestic merchandise exported, quantities and values, by articles, calendar years 1911 to 1920.

[Statistical Abstract of the United States, 1920.]

Articles.	1911	1912	1913	1914	1915
Sugar-mill machinery	$2,766,156	$2,375,929	$2,818,953	$1,814,137	$5,362,971

Articles.	1916	1917	1918	1919	1920
Sugar-mill machinery	$9,058,347	$11,471,779	$9,468,511	$13,805,940	$22,786,977

TATEMENT OF ROBERT E. MILLING, REPRESENTING AMERICAN CANE GROWERS' ASSOCIATION, NEW ORLEANS, LA.

Mr. MILLING. Mr. Chairman and gentlemen of the committee, I rill confine myself on this subject to a very few remarks.

It seems to me that the whole question presented to this committee s simply whether or not the American sugar industry shall continue o exist. We have what appears to be a three-cornered fight here—he producer of sugar in the United States as against the American efiner and the Cuban producer, the Cuban producers and the Ameri-an refiners on the one side and the American producer on the other.

We have been accustomed to these tariff fights since there has been a development of the beet and cane sugar industry in the United States. For many years prior to 1913 there was very little opposition to a sugar tariff by the refiners or importers from any section. In fact, for years the refiners themselves insisted upon a tariff. They not only insisted upon a tariff on raw sugar but they also asked for and secured an additional tariff on refined, and when that additional tariff on refined sugar became unpopular then it was imposed under the guise of imposing full duty on all sugars testing over 16 Dutch standard. The 16 Dutch standard was a considerable bugbear to the Congressmen who were unfamiliar with its purport and especially to the layman. It is simply a color test. In other words, all sugar sufficiently bright in color to go into direct consumption was taxed full duty because it tested in color above 16 Dutch standard. At last there came a man to Washington by the name of Bass, who was very bitterly opposed to the Dutch standard. He appeared before the committees of Congress and perhaps before your committee. You gentlemen may have heard him. He published a magazine called the "Gater," with a picture of an alligator on the cover. The more one read the Gater and Bass's articles on the 16 Dutch standard the more confused he became and the less he knew about it, but he made such a fuss about it until at last Congress repealed it.

Let us consider the 1913 tariff for the purpose of seeing whether or not this tariff as it existed or the permanent tariff as it now exists is a tariff under which the sugar industry can thrive.

One of the gentlemen speaking in the interest of Cuba who preceded me tells you that our industry is prospering with the 1-cent duty, but the fact is, gentlemen, that the Republican Party never gave us the 1-cent duty. We had a 1.685 duty imposed by the Republican Party, and in 1913 the Democratic Party declared that we should have free sugar and gave us the 1-cent duty for three years, in order that we might liquidate and get out of the business. Now, this 1-cent duty was on for three years, and it was well understood that it was only a liquidating duty, that the industry could not thrive with a 1-cent duty. In other words, we were to get out of business, I think, in 1916 in the spring. The war came in 1914, and this Government being in need of the revenues derived from the 1-cent duty then imposed and the Secretary of the Treasury publishing a statement that he thought it advisable to allow the duty to remain in order that the Treasury could receive that additional revenue is the reason why we have the 1-cent duty to-day. In 1914, when the war broke in Europe, up to 1916 the price of sugar increased on account of the stimulated demand. Especially was this the case when war first broke, in August, 1914. Some of our cane producers

who felt a few months before that they were ready for the bankrupt court had a portion of their sugar on hand, being unable to sell it even at the low price, and in a few weeks the price was up to 7 and 8 cents a pound, when it had been lower than 3 cents under the conditions that existed under the liquidating 1-cent duty imposed by the Democratic Party. These planters thus situated recouped considerable, and the industry in Louisiana began to come back to normal.

In 1917 there was an acute demand for sugar in the United States. The Food Administration was organized, and at that time refined sugar was selling on the Atlantic seaboard at from 8 to 8½ cents per pound. The beet-sugar producers patriotically came forward and offered their sugar at 7¼ cents, and the Louisiana producers conformed likewise and sold their direct consumption sugar (yellow clarified) at the same price, while refined sugar on the Atlantic seaboard was selling at 8½ cents a pound.

In 1918 the Food Administration demanded the cost sheets of the sugar producers in the United States, and after determining the cost of production they determined the price at which the crop should be sold. That year they bought the Cuban crop at 4½ cents f. o. b. Cuba. The Food Administration found that the American producers could not produce sugar in the United States at 4½ cents plus the 1-cent duty, and as we were in war they found it absolutely necessary that the industry be not sacrificed. The question arose as to how an additional price could be given the American producers. The question of imposing an additional half cent a pound tariff was discussed, but the administration was opposed to opening up the tariff question, and the whole problem was solved by the United States Sugar Equalization Board adding to the price of the sugar which they bought from Cuba 0.38 cent per pound, which was tantamount to increasing the tariff to that extent, and this spread of 38 cents per hundred between the purchase from the Cuban and sale to the refiner yielded a revenue to the United States of about $30,000,000.

The control by the Food Administration continued. The sugar producers made a small profit in 1917 and 1918, even with the restricted price placed thereon by the Food Administration, but the industry did not thrive. Why not? Why were not new factories built? Why did not the industry go forward as it had in the 15 years prior to 1913? Simply because there was a lack of confidence in such investments. Why, sirs, the beet industry in the United States from the time it was planted by the Republican Party in 1895 or 1896 increased from 40,000 tons in 15 years to over 700,000 tons—over 1,600 per cent. Why this great development? Simply because it was universally believed that sufficient tariff would continue to be imposed as would take care of the industry. Capital was perfectly justified in this belief, because the Republican Party was always willing to impose a tariff solely for the purpose of protecting the industry, and the Democratic Party had always declared that it would impose such a tariff because sugar was an exceptional revenue producer.

But this belief was dissipated in 1913. The Democratic Party assumed control, and its leaders declared that they were determined to put sugar upon the free list, and the result was that beet-sugar stocks went down to where they were almost worthless, and Louisiana

plantations could hardly be given away. The only owner who seemed to be able to farm his properties was the man who had before encumbered them to such an extent that the mortgage creditor was forced to furnish funds with which to operate the property or foreclose his mortgage.

The only thing that saved the industry from ruin during these four years of Mr. Wilson's administration was the breaking out of the Great War. Are you going to follow in the footsteps of that administration—that administration which declared that it proposed to place sugar on the free list with the full knowledge that it would destroy the industry—when the people of the United States have returned you to power and thereby repudiated the action of that administration? We do not think so.

There is no use to split hairs on the proposition. If you are going to give us a tariff at all, give us one large enough to take care of the industry. We do not need 1 cent; 1 cent will only permit us to cripple along with constant failures; 1 cent will put us out of business, gentlemen, under the existing conditions. Cuba can raise sugar for 1¼ cents per pound, and that island will raise it just as cheaply as it can be raised, because they have the soil and climate, they have the sugar houses, and have very little expense in cultivation.

Therefore, we must have a tariff that will give us something over 4 cents a pound for raw sugars in the United States, without which we can not continue in business in Louisiana, and I doubt very seriously that many of the companies engaged in the production of beet sugar will be able to stay in business.

Senator CALDER (interposing). What would that rate be?

Mr. MILLING. We would have to get about 2½ cents against Cuba—something like 3 cents general tariff. We might get along, Senator, on 2 cents a pound against Cuba, with which we could exist; but if you want the industry to grow, if you want real competition between the American producer and the seaboard refiner and the Cuba producer, if you want to stimulate the American producer to the extent that he will make sugar and make lots of it, give him the needed tariff.

Gentlemen, if you will examine the record showing the prices of sugar in the United States, you will find that in 1870 the refiner got about 5 or 6 cents per pound for refining sugar, while to-day we are having it refined in Louisiana at 75 cents per 100 pounds. Do you not see if we had no competition in the United States all the 15 or 20 refineries would have to do would be to get together and say, "We will not refine raw sugar at 75 cents per hundred pounds. Our refining charge will be 2 cents per pound, or 3 cents a pound, or possibly 4 cents per pound." What is going to stop them? I will tell you what will stop them. The best people out in the West saying, "We have our sugar factories. We are going to produce sugar, and we are going to produce it at 4½ to 5½ cents per pound, and we are going to sell it at from 10 to 20 points less than the refiners." That is what brought down the cost of refining from 6 cents a pound to 60 cents a hundred pounds. I have seen refined sugars sell on the New Orleans market, when the refiners were putting out of business the yellow clarified producers, at 60 cents higher than raw sugars, when as above stated, in 1870, it was from 5 to 6 cents per pound higher. This competition has been worth something to the people of the United States. The price of sugar has steadily declined, notwith-

standing the fact that we have had a very good tariff at all times up to 1913, especially when the Republicans were in power.

Then, why the necessity of all this propaganda about reducing the tariff in order to protect Cuba? Why the necessity of this fright on the part of the Cubans? If you will turn to the records for 1913 and examine the report of the hearings before the Ways and Means Committee, you will find that at that hearing there was also a three-cornered fight. The refiner and the Wholesale Grocers' Association of the United States on the one side and the American producer on the other. Congress made an investigation as to the personnel of the Wholesale Grocers' Association and found that it was none other than the Federal Sugar Refining Co. financing the association and running it through one of its officials, Mr. Lowry, who was toadying as secretary of the association. To-day the fight is the so-called Cuban producer and the refiner.

Who is the Cuban producer? When you ferret it out you will find that the men who stand behind the guns and are making the fight are none other than the seaboard refiners, most of whom own sugar plantations in Cuba. In other words, it simply means that the fight is all the time between the American producer and the refiners; and why? Because the American producer is the only competitor that the refiner has.

Mr. Atkins, who restified before the House Ways and Means Committee on a prior action and also testified at the time I speak of in the hearing of 1913, frankly stated that at the time his company (he then being president of the American Sugar Refining Co.) put $20,000,000 into the beet industry in the West. He advised against it, for he could see at that time that if that industry was built up in the West it would be a competitor that might destroy the seaboard refiners. It has not destroyed the seaboard refiners, but it has had the effect of reducing the cost of refining until such refiners do not make the money that was made in prior years, and this shows how near correct Mr. Atkins was in his prediction that they might have a competitor to the detriment of the seaboard refiners.

I can not feel that Cuba itself—that the heart of Cuba—the people of Cuba who ought to feel grateful to the American people for giving them their liberty, has asked that our domestic industry be destroyed. Are they selfish enough, when we picked them up, gave them their liberty, and enabled them to stand on their feet—gave them the monopoly of the surplus sugar market in the United States by giving them 20 per cent preferential—are they ungrateful enough to now say, "We want it all. We not only want the market for the excess consumption of the United States, but we want the whole market. We want you, the American producer, to get out of the way. We want to eliminate you entirely, and we want to supply the entire domestic sugar market of the United States.".

That is what their proposition means if they can succeed in inducing Congress to place only 1 cent duty upon the importation of Cuban sugar.

Senator SMOOT. There is another thing it means, I think—that if you can destroy the American industry here the American people will pay for sugar prices high enough to build all the factories in the United States each year.

Mr. MILLING. There is no doubt about that. I am perfectly convinced of that. If you will permit the seaboard refiners to fix the

price, they will fix a differential between raws and refined that will make the American consumer pay an additional sum, sufficient, as suggested by Senator Smoot, to build all the refineries in the United States.

I will not detain you gentlemen. The situation as already stated is just simply this, that we need protection to stay in the business, and the American people need us in the business, and we do not feel that the Senators of the United States would be justified in destroying the industry, but we do feel that they should impose such tariff as would take care of the industry—make it thrive as it did from 1898 to 1913.

Think of an industry developing 1,650 per cent from 1898 to 1913, and then, with the abnormal conditions that existed after that time—the war, higher prices—only going ahead 4 or 5 per cent since 1913. Why? Simply because, gentlemen, capital did not have confidence in the industry. They did have confidence in the industry in Cuba. It was there they invested their money. Having these investments, they now propose to the Congress of the United States to destroy the only competitors they have and give them the entire American market.

STATEMENT OF CHARLES DE B. CLAIBORNE, REPRESENTING SOUTHERN AND NATIONAL BANKING INTERESTS, NEW ORLEANS, LA.

Mr. CLAIBORNE. Mr. Chairman, I want to begin by setting your minds at ease on the idea, perhaps, that the South is not voting, in a measure, the way it thinks. You may be astonished to know that in the city of New Orleans Mr. Harding cast a bigger vote than John M. Parker when he won the governorship, and I believe I can say that there is no man in the South that is better thought of than John M. Parker; and yet Mr. Harding, a Republican, got a larger vote than did John M. Parker for governor. So that certainly shows, as the gentleman from Texas says, that we are to be congratulated on what we have done thus far.

I am merely here as a banker to confirm the statement that no matter what the polls show, as a matter of fact, the overwhelming number of banks in the South favor protection; and they favor a duty that will absolutely protect. There is no use of giving us a duty that will barely allow us to live; we would just as soon do away with it entirely.

In the State of North Carolina we circulated a petition and we obtained 414 banks, or 70 per cent of the total number of banks in the State of North Carolina, in favor of protection; and only 11 banks answered that they were against it. You could not hope on any subject to get a larger percentage than 414 to 11; and we are not through yet in that State.

Let us take the State of Mississippi. In that State, where everybody is believed to be against a duty on anything, one of the highest percentages is shown in that State as being in favor of protection by the banks, 81 per cent. In other words, 273 banks thus far have said "yes" and 5 banks said "no." You could not expect to get any better percentage than that. Take South Carolina, where 269 banks, or 61 per cent; Virginia, thus far, 50 per cent; and Louisiana, 80 per cent, and when I left home I had quite a number of cards which I feel sure would have brought that percentage up to 90 per cent.

As a matter of fact, that is to say, in the short time we have been working there we have 254 banks, and I believe soon we will be able to show that 80 per cent and likely 90 per cent of the banks of the South are in favor of a high protective tariff, for the coming year anyhow.

I say "high protective tariff," because in the past, and speaking for my State, in one particular industry that perhaps I know a little more about than the others, we have been accorded a duty on, and that is sugar, which has never been sufficient. There is no use consulting statisticians or experts or anybody else on the subject. You are dealing here with the matter as we bankers deal with it. We call for the man's statement. If a sugar planter comes up to me and says, "I want $200,000 for the year 1922," I do not call for the expert and say, "What do you think you can produce sugar for in 1922?" And let me see what he has been making in the sugar business, and if at the end of that time he has nothing to justify my giving him that money, I turn him down.

You gentlemen can have all the figures you want and you can hear all the experts you desire, yet the fact still remains that the average sugar planter in Louisiana is not in good financial condition. I am satisfied that you will find that same condition in the West; and, therefore, why ask if sugar can be produced at a figure, when at the end of 20 years the figures conclusively show that nobody can make money at that figure?

So, as a banker, we say that if you are going to give us a duty on anything, give us a duty that will allow us to live; give us a duty that we bankers feel that we can talk to this man as a business man and tell him "Go ahead, and we will back you."

I hear people say that 1.60 duty against Cuba is enough on sugar. I do not know whether these fellows have occasion to lend money based on what they say. But I am talking now as a banker who is an officer of the largest sugar bank in the United States—I mean domestic sugar—the Whitney Bank, which perhaps lends more money and does a larger sugar business than any bank in these United States, and I want to tell you honestly and frankly that we are not going to loan any money based on 1.60 duty of sugar against Cuba. In other words, if sugar is going to live in Louisiana, we must have a duty that will maintain that commodity at 4 cents, or that commodity is going out of existence so far as we bankers are concerned.

I can no more lend on sugar than I can on bonds without the necessary margin, and I tell you that the statements of all the planters I have seen—and you can call for those statements, if you have any reason to doubt what I tell you—and they will show that we are not justified in putting out the money.

You can send to the merchants of Louisiana; you can ask the big firms like Baldwin and Esherman, all the hardware and implement people that sell to the sugar people; ask the oil men how they feel about their bill for the next year, and ask them if they are going to sell oil to the sugar planter based on a duty of 1.60. What answer are you going to get? "No."

Therefore, why talk about our ability to get along on that when all the men who deal directly with the industry tell you that they can not get along on that basis.

I merely mention sugar because I could talk more intelligently on that particular commodity. But the same thing applies to all others.

We, as bankers, are not particularly interested in any one thing. We know, however, that we have no hope for success unless sugar, cotton, wheat, corn, and every other commodity is on its feet.

There is no use of being deceived by the figures which you may get from the Federal Reserve Board about all the gold that we have and about the 80 per cent reserve against circulation, and all of that stuff. That only proves what I am saying, that the country to-day is in a bad fix, and if they have got 80 per cent it is because the people now have no need for the money. There never was a time in the history of this country that I have been able to find when your public utilities, your steam railways, your big industrials, your sugar people, your corn people, your wheat people, and other lines of business that you can think of need this assistance as much as they do now.

Personally, I believe that we are going too far with this idea that we are supposed to help out the entire world. I am convinced that it is simply national vanity or some type of egotism that leads us to believe that we, the American people, have been ordained to save the entire world. You have got yourselves to save now, and you can take it from me, you can go all over the South and all over the West; you consult your western Senators and your southern Senators or anybody that you want to and ask them how their financial institutions and their commercial institutions stand. If you expect those assets to remain solvent, if you expect those values to keep up, it is up to you gentlemen to give whatever assistance you can.

But, as I say, that assistance must be given along intelligent lines. This is no time to compromise, no time to equivocate. When a man comes before you here and talks to you gentlemen, do not let him talk about what can be done. Ask him what has been done and make him show you. Do not let any of these theorists and these professors come up here and talk to you. If a man says he believes a certain thing can be done, ask him, "Well, would you put your own money out on that basis?" When a man tells you that he can conduct the sugar business successfully with 1.60 duty, tell him, "Would you buy a sugar plantation operated on that basis?" Or I tell you, gentlemen, I will lend you a plantation fully equipped and I will lend you a sugar house that you could not build for a half million dollars, and 3,000 or 4,000 acres of land, furnish you the mules and the whole works if you will operate it for next year. Do you know of any other business in which men have invested $800,000 or $900,000 that you can have the use of for nothing?

I merely mention to you these facts because I know I have attended meetings and I know people who are in the habit of coming to you gentlemen and theorizing, coming up here with a world of statistics that prove absolutely nothing. All they are talking about is the future; my feet are guided by the past and by nothing else; we do not loan money on what we expect; we are not promoters and have nothing to do with promoters. We lend on what history shows has taken place. If a man tells me he is worth a half million dollars and he wants the loan of $250,000, I say, "Give me a sworn statement and let us see what that half million is made up of"; and if it is made up of cats and dogs, he does not get a cent. He has to show me. All I ask is for you gentlemen to do the same thing.

When anybody tells you what wealth they have in sugar, cotton, cottonseed oil, or anything else, do not let that fellow give you a lot

of dope in figures; ask him if anyone has been able to make mone on that basis and to give you the names of men in that business; an do not pick out one single instance, but take the business as a whol Take the cotton, wool and sheep, cattle and hide business. Look your hide companies and see how they are getting along; look at th cattle business and see how the cattle raisers are getting alon That is what you gentlemen want to see. Do not listen to these fe lows who are going to tell you, "We can make money on so and s if you give us so much protection."

I just thought it was my duty as a banker to assure you of th position we take. As I say, we are not interested, and we do n care—if you want to put the sugar business out of existen Louisiana is willing to pay the penalty. But if we are going to liv then give us what we ask for, because I hope you will do me th justice to believe that I am telling you the facts, and if you wa absolute statements from the individuals, I will get the statement But please do not listen to that dope about what can be done ne year, but take the figures on what was done last year. One is not ing but prophesy and the other is history; and you know you ca depend on one more than the other.

Gentlemen, I thank you for the time I have taken up.

STATEMENT OF HENRY N. PHARR, OLIVIER, LA.

Mr. PHARR. Mr. Chairman and gentlemen of the Finance Com mittee, not knowing until I arrived here this morning that it woul be my privilege to appear before you, I have not prepared a writte brief. I feel, however, that I would like to indorse all Mr. Claibor has said and all of the presentation made a few weeks ago befor this committee by other representatives from the State of Louisian Mr. Chaffe, Mr. Rogers, and Judge Milling.

My earliest recollection is that of moving on a sugar plantati in Louisiana as a boy 7 years of age. My family has been in th sugar business since that time, never lived elsewhere, and are st making sugar in Louisiana. Therefore I am in a position to say th what Mr. Claiborne has just stated to you is absolutely true.

The sugar industry, as all of you know, has unquestionably bee the football of politics, and, therefore, we have not known for a length of time in advance what the future had in store for us so f as a tariff was concerned. I am glad to say, however, that the Louis ana sugar industry has always been outspoken in favor of protect tariffs, not only for the sugar industry for Louisiana but for American industries, and our Senators, with the exception possib of one or two, have stood out boldly for protection to American i dustries from the time of Randall Gibson on down to Ransdell a Broussard. It is absolutely impossible for the industry to prosp without a sufficiently high tariff, but the figure that has been nam of 2½ cents against all sugars except Cuba and 2 cents against Cu will enable us to live and insure us a slight degree of prosperit Without that we do not see how we can secure the necessary capit to continue the industry.

Some one may ask, "Why, then, continue an industry of th kind, one that demands protection higher possibly than the be sugar industry of the West or the cane-sugar industry of our insul possessions?" We answer, not with a spirit of egotism, but wi

pardonable pride, that the sugar industry of the world owes a debt to Louisiana. You go into the Tropics to-day, you enter any large factory, and you will find in nine cases out of ten a Louisiana man at the head of that factory or in charge of the chemical department. We are educating in Louisiana the chemists and the mechanics and the superintendents that are taking charge of the large factories in the Tropics. Consequently, it is to the interests of the sugar consumers of this country, that this good work be not interrupted. Aside, however, from this incidental advantage to the sugar producing world from Louisiana, we claim that the domestic sugar industry is absolutely essential for the protection of the American consumer.

If you destroy the domestic sugar industry you place the American consumer absolutely at the mercy of the refiners. This has been proven in the past. Whenever Louisiana sugar and beet sugar has come upon the market there has always been a drop in price unless something unusual has happened at that particular time to affect the market; but in the ordinary course of affairs that has been true, and the Louisiana sugar industry and the beet-sugar industry of the West are the safety valves of the sugar market. If you destroy these industries—you do not have to help them except by levying a sufficient tariff—you absolutely place the American consumer at the mercy of the refineries. We therefore claim that it is an absolutely demonstrable fact, that can not be controverted, that if you do not furnish Louisiana and the beet people of the West the necessary tariff to enable us to continue to produce sugar for the American people you are doing the American people an injustice, regardless of the injury to us, because you are placing them at the mercy of the American refiners, and past experience proves that they are not very merciful when they get the consumer within their hands.

It is a question, gentlemen, to-day, it seems to me, of whether Cuba or America shall continue as sugar-producing countries; whether you are going to let them both continue or whether you are going to let Cuba furnish all our sugar and destroy the industry in this country.

We believe from every possible standpoint that it is to the interest of the American people that you allow both of these industries to continue. The Cuban industry will continue despite any legislation you may enact. The American-sugar producing sections can not furnish more than half of our necessary consumption; Cuba will furnish the other half. Therefore, they must produce sugar—they can do it cheaper than any other country in the world, and they can find a ready market for at least half of their product in this country. and we know, regardless of the tariff that you impose, the law of supply and demand will necessarily regulate the price sufficiently to enable them to make a profit that will insure their continuance in the business.

Mr. Chas. Claiborne, who represents one of the largest banks in New Orleans, the Whitney Central National Bank, and the bank that lends greatest assistance to the sugar planters of Louisiana, has definitely stated the attitude of the bankers and the resultant conditions if an adequate tariff of 2 cents a pound on sugar against Cuba is not written in the new tariff bill. From past experience, since Mr. Claiborne is my banker, I can testify that funds will not be

forthcoming for the 1922 crop unless this honorable committee recommends adequate protection to sugar. Since, however, the absolute necessity for a 2-cent tariff against Cuba has unquestionably been demonstrated by Mr. Claiborne to-day, and our other representatives a few weeks ago, I am not going to worry you by repeating facts and figures in confirmation of this truth. I simply wish to stress the point that it is now, and will be ultimately, to the interest of the American people to maintain their continental domestic sugar industry. This was unquestionably demonstrated during the World War.

We trust, therefore, that you will bear this in mind and not listen to the pleas of Cuba about the billion dollars of American money that is invested in Cuba as against the billion dollars of American money that is invested in the South and in the West. We want to stress that point with you. The investment is practically the same—a billion dollars of American money in Cuba or a billion dollars of American money invested on American soil on the mainland and in our insular possessions; and we feel that certainly we who have invested our money here in the United States are more in need of and more deserving of that protection than those who have invested their money in a foreign country, even a country that is friendly to America.

Besides being a sugar planter, Mr. Chairman, I am also in that unfortunate list known as the rice planters, and the rice men have asked me to say just a word for their schedule. It seems that in the general tariff bill you have treated them very fairly, with one exception, and that is you have decided to put a certain grade of rice, called paddy rice, on the free list. You have done that on the request of certain men who make canned foods, and I think it has been very conclusively shown you in this brief which has been previously submitted to you, that the advantage accruing to the manufacturer in this case is infinitesimal as compared to the corresponding damage done to the rice farmer who produces this low grade rice. The difference in the cost of the paddy rice that goes into one can of soup either with or without a tariff is so infinitesimally small that it absolutely can not affect the retail price to the consumer, nor materially lessen the manufacturer's profit. On the other hand it makes a very decided difference in the financial results of the farmer whether this particular grade of rice is admitted free of duty or is properly protected by an adequate tariff.

BEET AND CANE SUGAR.

[Paragraph 501.]

STATEMENT OF GRAY SILVER, REPRESENTING THE AMERICA FARM BUREAU FEDERATION.

The proposed tariff law (the Fordney bill) gives to the American producers a p tection of 1.6 cents a pound on his sugar, meaning that imported sugar can not at wholesale much under 4 to 5 cents per pound.

It means, on the other hand, that the consumer pays a tax of 1.6 cents on ev pound of imported sugar purchased, and that the Cuban producer, in order to his sugar in the United States, must accept a price approximately 1.6 cents be that received by the domestic producer. The consumer buying sugar at retail n pays in Washington 6 cents a pound. Of this price, 1.6 cents is tariff duty, constit ing a consumption tax of 26.6 per cent. This is paid willingly in most cases, to prot the American producer, but a tax much higher would be murmured against. A poli which requires millions of farmers and laborers to pay a consumption tax higher th

5 per cent on a necessity such as sugar, in order to enable a comparatively small number of American producers to produce sugar more profitably, will be in danger of repudiation unless it is shown that the higher tariff is absolutely necessary.

Even if the import duty were trebled, some Cuban sugar might come to the United States. The fact must not be lost sight of, however, that the domestic crop of sugar lacks somewhat over 2,000,000 tons annually of supplying the Nation's needs. Under this condition, there is no virtue in a policy which assesses as much duty as the traffic will bear. Middle ground must be held. Both the American producer and the American consumer must be protected. Protecting the producer means to assure him a fair and reasonable price for his products; protecting the consumer means to enable him to obtain the required amount of sugar at a fair price, which, of course, includes encouraging the Cuban producer to continue sending to the United States each year somewhat over 2,000,000 tons of sugar.

A better policy, as regards a sugar tariff, would be to adopt President Harding's proposed elastic tariff, with the Fordney bill provision of $1\frac{16}{100}$ cents per pound on sugar testing not above 75 degrees (amounting to 1.6 cents per pound on Cuban sugar of a 6-degree polariscope test) as a minimum duty. This gives the American producer a protection averaging six-tenths of 1 cent per pound over and above the protection he received prior to the adoption of the emergency tariff in May, 1921. With the Fordney rate as a minimum and with a possible maximum authorized by Congress as an item of an elastic tariff, the President might fix by proclamation the higher rate if at any time it should become evident that American producers are losing ground to the detriment of the country.

A DISCUSSION OF THE TARIFF.

The United States produces about 2,000,000 short tons of sugar per year, including the crops in Hawaii, Porto Rico, and the Philippine Islands. This amount is slightly less than one-half of the annual requirements. Most of the additional supply is cane sugar imported from Cuba.

Under the terms of the reciprocity treaty made between Cuba and the United States in 1903, the former enjoys a reduction of 20 per cent from the regular duty paid by other countries shipping products to the United States.

As practically all of the imported sugar has been coming from Cuba, this discussion is limited to points pertinent to the tariff relation between the United States and Cuba.

A large volume would be required to treat completely the subject of the sugar trade. It seems to be an unwarranted repetition, therefore, in a discussion which must of necessity be brief, to include numerous statistical tables such as appear in the survey prepared by the United States Tariff Commission, the reports of the Federal Trade Commission, and the brief of the American Cane Growers' Association.

For detailed statistics on production, imports, exports, consumption, and prices the reader is referred to those reports, but this treatment includes several summary talks, presenting a résumé of the situation as a whole and pointing out several pertinent features which have not received complete attention elsewhere.

WORLD PRODUCTION.

The total annual world production of cane and beet sugar is about 20,000,000 short tons. From 1912 to 1914, inclusive, each year's product was somewhat above this amount. A large proportion of the world product is beet sugar originating in Europe. In the year 1913–14 the European beet-sugar crop amounted to 8,688,400 short tons, being over 42 per cent of the world crop. Of the European product, Russia, Germany, and Austria-Hungary produced six and one-half million tons, or 75 per cent of the total. No cane sugar is produced in Europe. Naturally, the World War had a deterrent effect upon sugar production in Europe. From the large crops of 1913–14 there was a decline to less than 5,000,000 tons in 1917–18, to three and one-half million tons in 1918–19, and to two and nine-tenths million tons in 1919–20.

World production did not suffer as greatly as did European production, because of support from other countries. From a world total of 20,602,768 short tons in 1913–14, there was a decline to 17,049,407 tons in 1919–20. In other words, the world crop declined only three and one-half million tons, whereas the European crop registered a decline of five and one-half million tons.

It was stated above that European sugar is produced from beets. Most sugar produced in other regions, on the contrary, is cane sugar. The United States is the only nation outside of Europe which produces beet sugar to any appreciable extent, and the year 1920–21 is the only one within the 1911–1921 period when production reached 1,000,000 tons. From 1913 to 1919 the annual product did not vary more than 150,000 tons, the average crop being about 775,000 tons.

It is seen, therefore, that the increased production of 2,000,000 tons in countries other than Europe, making up a goodly part of the five and one-half million ton decline in Europe, was entirely due to stimulation of the cane-sugar industry.

CANE-SUGAR PRODUCTION.

The world crop of cane sugar has been increased steadily from 10,136,092 short tons in 1911-12 to 14,211,835 short tons in 1920-21. About four-fifths of the cane-sugar supply is produced in Cuba, Java, India, and the United States (including Porto Rico, Hawaii, and the Philippines). Referring to the production table accompanying this report (Table No. 1) it is seen that only a very small part of the increase can be credited to Java and the United States. The statistics for Cuba, however, tell a different story. From a crop of 2,142,000 tons in 1911-12, the output was increased to 4,423,519 tons in 1920-21, representing an increase of 2,281,519 tons, or 106 per cent, within 10 years.

It was indicated in the preceding paragraph that the world crop of cane sugar was increased slightly more than 4,000,000 tons within the past 10 years. This increase is represented approximately by augmented production in the following amounts and countries:

	Tons.		Tons.
Cuba	2,281,519	Africa	180,000
India, Japan, and Formosa	740,000	British West Indies	80,000
Java	270,000	Other West Indies	100,000
South America	300,000	United States	80,[illegible]

THE OUTLOOK.

Production of beet sugar in Europe undoubtedly can be restored to the prewar level, adding thereby about 5,000,000 tons to a crop which in 1920-21 was only about 1,000,000 tons below the prewar level. Most of the Indian sugar is consumed locally, and any increase probably will go also into such uses, without affecting the world situation. Cuba apparently can continue her heavy production—probably she can even proceed with her steady increase in production—while several other countries (excepting the United States) can augment their sugar industries.

SUGAR SUPPLY IN THE UNITED STATES.

Production.—It was pointed out above that the beet-sugar crop in the United States has not been materially increased since 1913-14 with the exception of the one big crop in 1920-21. Louisiana is the only State of the Union worth considering in the cane-sugar industry and it is generally conceded that production in Louisiana has reached its maximum. The high prices and patriotic sentiments during the war did not result in any increased production in Hawaii or the Philippines, and had only a slight beneficial effect in Porto Rico, hence it is pretty safe to say that under present methods of production and in view of the present freedom of importation, the domestic product of the United States will not be increased.

Total production of cane sugar in the United States (including Hawaii, Porto Rico, and the Philippine Islands) was only about 80,000 tons greater in 1920-21 than it had been 10 years previously. The average annual production during the past 10 years, in short tons, has been: Louisiana and Texas, 236,451; Hawaii, 597,959; Porto Rico, 430,734; Philippine Islands, 301,776; total, 1,569,317 short tons. This amount of cane sugar, plus the average production of beet sugar, amounting to about 775,000 tons, makes a total sugar production of about 2,344,000 tons yearly.

It should be noted, however, that not all of the sugar produced in Hawaii, Porto Rico, and the Philippines comes to the United States proper. Probably the annual supply of domestic sugar is not much above 2,000,000 short tons.

Imports.—Sugar imported into the United States is practically all made from cane. The importation of cane sugar has ranged from 1,828,279 short tons in 1911-12 to 3,7[illegible],321 tons in 1919-20. Of these amounts of yearly imports, 87 per cent to 99 per cent came from Cuba. The actual amount which entered from Cuba in 1911-12 was 1,593,315 tons, while in 1919-20 it was 3,452,855 tons, representing an increase of approximately 117 per cent.

It should be remembered, however, that the year 1919-20 was not normal in the sugar trade. Prices in the United States were so high that importation was unusually stimulated. In spite of the fact that importation from Cuba during that year was considerably larger than it had ever been before, the Cuban product comprised only [illegible] per cent of the imports, whereas in preceding years, back to 1912-13, the Cuban product had averaged about 95 per cent of the imported supply. In 1920-21, while the total importation of cane sugar was only 296,223 tons, less than in the preceding year, the importation from Cuba declined 990,040 tons, bringing the percentage of the im

rts originating in Cuba for that year down to 71, which was the lowest point within years. It is evident, therefore, that in 1920–21 much larger supplies than usual me from sources other than Cuba. Reference to imporrs (Table No. 3) shows that actically all of the cane sugar imported in 1920–21 paid the regular duty, and as the ular duty from countries other than Cuba is 20 per cent higher than the Cuban ty, it appears that the decline of nearly 1,000,000 tons in imports from Cuba was ade up in imports from countries paying the higher rate.

Under the discussion of world production it was pointed out that the Cuban product creased over 2,000,000 tons annually during and following the World War. The ta on imports show that most of the larger Cuban crop has moved to the United ates. It would appear, therefore, that consumption in the United States must have creased greatly, because it has been shown that the domestic production remained out constant. This, in fact, is what occurred, as it is shown in the following section at shipments abroad did not increase materially.

Exports.—The United States is not a sugar-exporting country, although during the orld War this trade was so increased that in the year ended June 30, 1916, the shipents abroad amounted to 842,940 short tons. From 1910 to 1914, inclusive, the nual exports, with one exception, were less than 50,000 tons, and by 1921 they had clined to 386,718 tons.

Supply and consumption.—It has been shown that the sugar supply is made up of mestic product amounting to nearly 50 per cent of the requirements, while most of e balance as a general rule comes from Cuba. Consumption has ranged from 53,558 short tons in 1911 to 4,574,833 tons in 1920.[1] This increase of nearly 1,000,000 ns in annual consumption, plus the exports which grew abnormally large during e war, will account for the increase of half a million to nearly 2,000,000 tons of imrted Cuban sugar.

TARIFF REGULATIONS—ACT OF 1913.

The tariff act of 1913 fixed the duty on sugar at 0.71 of 1 cent per pound on samples sting not above 75° by the polariscope, and for every additional degree shown by he polariscope test 0.026 of 1 cent per pound additional. Considering 96° as the erage test of Cuban sugar, the duty under this law would have been 1.256 cents per ound. In view of the reciprocity treaty arranged with Cuba nearly 20 years ago, nder the terms of which the duty on Cuban products imported from Cuba are 20 per ent lower than the general tariff duty, the actual duty paid on Cuban sugar under the 913 law was 1 cent per pound.

THE EMERGENCY ACT.

The emergency tariff law increased the duty so that it amounts to 2 cents per pound on 96° sugar, meaning on Cuban sugar (with the reduction of 20 per cent) a duty of 6 cents per pound.

THE FORDNEY BILL.

Under the Fordney bill the rates established by the emergency tariff act are conined without change, the average duty being 2 cents per pound on sugar generally, and 1.6 cents a pound on Cuban sugar.

DESTINATION OF CUBAN SUGAR.

Few people will deny that the United States is the natural and most convenient arket place for Cuban sugar. Nevertheless, considerable amounts of this product ave been shipped to other countries. Reference to Table 4 accompanying this ort shows that in each year from 1916 to 1919, inclusive, Cuba sent somewhat over 000,000 tons of sugar to the United States, and about 1,000,000 tons to other destinans. The United Kingdom took a rapidly increasing proportion of the Cuban oduct, amounting in 1919 to 881,920 tons. If the records for 1920 and 1921 were vailable, undoubtedly this tendency to ship sugar to countries other than the United tates would appear to be greatly accentuated, because it is a matter of quite common nowledge that in the fall of 1919, when the United States Sugar Equalization Board ucked authority to purchase the Cuban crop at about 6½ cents per pound, other counries took large amounts of the sugar at this (which later proved to be a very low) ice, and subsequently shipped the same sugar to the United States at a tremendous ofit. This partly explains the previous statement that in the year ended June 30, 921 the importation of sugar was up to the high general average, but that imports rom Cuba were nearly 1,000,000 tons lower than in the preceding year.

It is claimed by good authority, on the other hand, and no doubt correctly, that large ocks of the 1920 sugar crop are still in the Cuban warehouses, having been held be-

[1] Data from Willett & Gray.

cause of the low price in the winter of 1920–21 following the heavy shipments to the United States by other countries, and that this surplus sugar now threatens to swamp the United States market and destroy the American producers.

It is a strange indictment of public thought by economic and psychological conditions that during the year ended June 30, 1920, and the beginning of the year following, when consumers of the United States believed there was a scarcity of sugar, and were demonstrating their readiness to pay unheard of prices, the imports of sugar were heavier than they had ever been before. This was when numerous foreign countries where shipping Cuban sugar to the United States.

Early in the fall of 1920 the public awoke to the fact that a great surplus of sugar was on hand. Prices declined rapidly, and much of the large crops produced in Cuba that year remains unsold.

CUBA'S FUTURE SUGAR MARKET.

Concerning the possibility of new markets being found for Cuban sugar, two facts demand attention; first, tariff duties assessed by the importing nations; and, second, the ocean freight rates from Cuba to the country of destination. As Great Britain has been the chief among foreign nations purchasing Cuban sugar, this phase of the study is confined to British conditions.

British sugar tariffs.—Since April 23, 1918, the general tariff assessed upon sugar of 96 degree polorization imported into the United Kingdom has been £1 2s. 4½d. per hundredweight (112 pounds). This amounts to practically $5.44 per English hundredweight, or 4.9 cents per pound if exchange be considered at par. Certainly no other basis should be assumed for computing the value of the pound sterling, because undoubtedly Parliament or the cabinet in framing a tariff law did not contemplate a depreciated standard of value.

Ocean freight rates.—At the present time (December, 1921) the freight rate on sugar from Cuba to the United Kingdom is $5 to $6.50 per long ton, or about 25 cents per 100 pounds. Freights to the United States are 12 cents per 100 pounds to Gulf ports and 13 to 17 cents to New York.

It is seen from these considerations that the British import duty is about 3.3 cents per pound higher than the United States duty and that the ocean freight rate to the United Kingdom is nearly one-eighth of a cent per pound greater than the rate to the United States.

The United States import duty of 1.6 cents per pound is quite low compared with the United Kingdom duty. Even with the present duty trebled, Cuba could ship sugar to the United States more economically than to England.

American consumers, however, would be compelled to pay war-time prices for peace-time sugar, which undoubtedly they would not do for an extended period. There is no assurance, moreover, that England expects to figure extensively in the Cuban sugar trade. It was only during the World War that Europe began to draw heavily upon western sugars, and in times of peace the former trade channels will prevail.

TABLE 1.—*World production of sugar.*

BLACKSTRAP (WASTE) MOLASSES.

[Paragraph 503.]

STATEMENT OF GEORGE A. CHAPMAN, REPRESENTING AMERICAN FEED MANUFACTURERS' ASSOCIATION, CHICAGO, ILL.

Mr. CHAPMAN. Mr. Chairman, I personally represent the American Feed Manufacturers' Association; and in compliance with the request of your committee the men who are here to be heard with me held a meeting and requested that I make for them a general statement. They also are very desirous of being heard personally, as they have so much on their hearts in connection with this.

Senator SMOOT. I think it would be very much better if you could make a complete statement yourself, and then if they have any briefs let them file them.

Mr. CHAPMAN. These gentlemen I am speaking for, in addition to the American Feed Manufacturers' Association, are: Mr. George H. Forsee, Kansas City, Mo., for Kansas City Hay Dealers' Association, and Missouri River Feed Manufacturers; Mr. Lou H. Robertson, Abingdon, Ill., for Military Tract Shippers & Feeders Association; Mr. Frank C. Jones, Bullville, N. Y., for Eastern Federation Feed Merchants; B. T. Manard, New Orleans, La., for Penick & Ford,

ealers in domestic and imported molasses; E. Wilkinson, Birmingam, Ala., for Alabama Division, American Cotton Growers' Assoation; Floyd Wilson, Lamar, Colo., for Colorado, Wyoming, New lexico & Kansas Alfalfa Millers; Mr. Dwight Hamlin, Pittsburgh, a., for Pennsylvania Feed Manufacturers; Mr. A. F. Seay, St. Louis, lo., for St. Louis and East St. Louis (Ill.) Feed Manufacturers; Mr. . B. Edgar, Memphis, Tenn., for Memphis Feed Manufacturers.

We are here, gentlemen, in opposition to paragraph 503, which is he molasses schedule. We believe that in the interest of our manucturing business and in the interest of the American farmer that lackstrap molasses should be permitted free entry. We realize that e are before a Republican Congress who believe in protection to merican industries, and we also realize that we are in a time when is necessary that our Government have revenue. So, in the event hat you can not give us free entry, we want to take the position that he rate of duty on blackstrap molasses should not be in excess of oneourth cent per gallon flat.

Paragraph 503 now specifies one-fourth cent per gallon based on 8 per cent total sugars, and an additional 275 one-thousandths of 1 ent for each per cent of total sugars over 48.

I would explain in regard to that that this is a new departure in he matter of a tariff on blackstrap molasses. The tariff has never efore been based on this total sugar content; it has been based on polariscope test of 40°. There has been some objection raised to he polariscopic method because it is said not to be as accurate as he total sugar basis by the Clerget method, and it has been said that igher grades of sirups than blackstrap have been by this means rought into the country at the blackstrap rate, and it has also been aid the blackstrap molasses has been brought into the country and urther extraction of sugar made.

I do not think there is very much to that latter claim. There has een to our knowledge not more than one concern that did that, and I believe that was only profitable during the period of very highriced sugar, and possibly that concern was also able to get in some igh-tested molasses. However that may be, if it is not presumptuous n our part, we would suggest an amendment to paragraph 503 wherein molasses for use other than for the further extraction of ugar, or for human food, might come in—this is blackstrap molasses I refer to—at the basic rate of not to exceed one-fourth cent per allon.

We base this on a 40 per cent sucrose content by the Clerget method.

I do not believe it is necessary on a 40 per cent sucrose basis to afeguard any further extraction of sugar, but we have included in our suggestion a provision which will prevent the further extraction of sugar in order to clear the atmosphere. There seems to be a ermeating atmosphere that it might be possible, and therefore I will read a paragraph as we would suggest to have it amended reading]:

Paragraph 503. Molasses testing not above 40 per centum sucrose by Clerget method, when imported for use other than extraction of sugar for human consumption, twentyfive one-hundredths of 1 cent per gallon. All other molasses and sirups testing not above 48 per cent total sugars, twenty-five one-hundredths of 1 cent per gallon; testing above 48 per cent total sugars, two hundred and seventy-five thousandths of 1 cent additional for each per cent of total sugars and fractions of a per cent in proportion.

This amendment, gentlemen, would let in at the basic rate all of the blackstrap molasses which is the final residue from the manufacture of sugar from sugar cane.

Senator SMOOT. Under the Underwood bill it was 15.

Mr. CHAPMAN. Under the Underwood bill it was 15, under the existing law it is 25 per cent ad valorem, and the value in Cuba to-day is not to exceed a cent a gallon.

You note that we would go on with the balance of paragraph 50[illegible] and leave it just as it is now, so that molasses for the purpose of further extraction of sugar or for human consumption might be affected just as the Fordney bill proposes.

Senator SMOOT. You would be satisfied, then, to change that 48 per cent to 40 per cent?

Mr. CHAPMAN. No; the 48 per cent is total sugars.

Senator SMOOT. You say "molasses," so it reads as follows: "Molasses and sirups testing above 40 per centum" total sugars, and 0.275 of 1 cent per gallon?

Mr. CHAPMAN. No; my suggestion is 40 per cent sucrose, which is different from the total sugars. You see, you have the sucrose and the invert sugars to make the total sugars. Blackstrap molasses tests as follows by the different methods:

Sucrose by polariscope		22-[1] [illegible]
Sucrose by Clerget method	per cent..	[illegible]
Reducing sugars	do....	14-[illegible]
Total sugars by polariscope	do....	40-[illegible]
Total sugars by Clerget method	do....	4[illegible]

Gentlemen, you are dealing with a commodity which is the basic fundamental necessity for a very large industry. It is a fundamental necessity for a feed-manufacturing industry which has been built up in the United States in the past 15 years employing at least $200,000,000 of capital, with an annual output of approximately 3,000,000 tons of ready prepared rations, employing thousands on thousands of men—laborers, salesmen, office employees——

Senator DILLINGHAM (interposing). I do not understand what your product is.

Mr. CHAPMAN. It is a balanced ration for live stock, manufactured from various commodities, of which blackstrap molasses is the basic material.

The use of these feeds has grown tremendously. The farmers find that their stock do better on these rations. This blackstrap molasses is not and should not be considered a substitute for corn or oats or the home-raised feeds. It should be regarded just as we regard the table sirup in connection with our corn cakes in the morning. It makes the stock eat more corn and home-raised products, and therefore just as it makes us eat more cakes, the farmer gets a quicker and more profitable turnover in fattening cattle. Under the old methods it used to require six months to a year to fatten a steer. Steers are now fattened in 75 to 120 days by using the molasses as supplemental feed—so the home grown.

Senator CALDER. Is the molasses mixed with the feed?

Mr. CHAPMAN. It is handled in both ways. The farmers buy large quantities of it in barrels, but that is very expensive, because of the

[1] This is far under limit of 40° provided in emergency tariff and former tariffs.

xpensive package, local freight rates, etc. The feed manufacturer nakes a ration to balance the home-raised feeds, and these balanced ations carry 20 per cent to 60 per cent of molasses, just as much as the nixture will absorb; and then these molasses feeds are fed along with he home-grown grains.

To show you something of the demand that there is for these products, I would like to read you quotations from Farmers' Bulletin No. 218, issued by the United States Department of Agriculture in November of this year. The Agricultural Department in this bulletin n suggesting rations for fattening 2-year-old steers in the corn belt, n a total of 12 suggested rations, mentions only three concentrates other than corn, silage, or other farm-raised products, namely, cottonseed meal, linseed meal, and molasses. These are all used as supplemental feeds to corn or other farm-raised feed stuffs, and in all but two of these rations one or more of these three concentrates were named.

I think no argument is necessary to show you that if anything should happen to put the price of molasses where the farmer could not longer afford to use it in fattening his cattle, he would have to go on to the other two of the concentrates recommended by the Agricultural Department, namely, cottonseed meal and linseed meal; and on account of the increased demand there would be an increased higher price level for those other two concentrates; and it is not only a matter of the molasses to the farmer, but it is a matter of raising the price of his other feedstuffs.

Senator McLEAN. You say it costs a cent a gallon in Cuba?

Mr. CHAPMAN. About a cent a gallon at the present time. Of course, we are laboring under very abnormal conditions at this time. Molasses is a drug; it is very difficult to dispose of even the domestic crop.

Senator McLEAN. It is a good deal cheaper than corn meal?

Mr. CHAPMAN. Yes; but you must bear in mind that we have freight from the interior of Cuba. This molasses is pumped out of the storage tank at the sugar factories, on the island of Cuba, for instance, and shipped to the seaboard, and then it is pumped into an enormous storage tank which may contain the product of a large number of sugar factories. It is pumped out of this large storage tank at the seaboard into tank steamers and is brought to the American seaboard and is there pumped into large storage tanks which may be partially filled with other molasses. There must be considered the expense of the tank-car service, the tank steamers, pumping into the tanks in Cuba, pumping into tank steamers to bring it to our own seaboard, and then the freight charges which have gone sky-high since the advances in freights.

Senator McLEAN. What does it cost the consumer a gallon?

Mr. CHAPMAN. It depends on where he is located, of course, after paying the freight. At the present time, the molasses is not coming in, and that is what I say to you gentlemen, that if you act upon this additional duty, blackstrap molasses will not come into this country; it is not coming in for feed purposes to-day on account of the low price of grain and the high freight rates. It is a long-haul commodity; it must come up from the Gulf ports, clear to our cattle-raising sections and into the dairy sections of the Northeast.

Senator McLEAN. It is considered a by-product?

Mr. CHAPMAN. It is a by-product; yes, sir.

Senator McLEAN. Do they not have it in Louisiana?

Mr. CHAPMAN. They have it, and that is the point I am coming t gentlemen. We have it in Louisiana; we have it in very sma quantities there. For seven years last past this country has raise in blackstrap molasses only 8 per cent of the amount used. In othe words, we imported 92 per cent.

I do want to say this, that the feed manufacturers and the gentle men I am representing have no fight with the sugar people. W want to see the sugar industry of this country prosper, and I belie it should be protected on sugar by a duty adequate——

Senator McLEAN (interposing). What percentage of the value o a ton of cane would be represented in the blackstrap molasses?

Senator SMOOT. It is nominal.

Senator McLEAN. It must be very small.

Judge MILLING. It is small—4½ gallons to the ton.

Senator McLEAN. What is a ton of cane said to be worth?

A LOUISIANA WITNESS. Cane is worth $3.85; that is the averag price paid at our factories.

Senator McLEAN. Then what would the blackstrap molasses b worth?

A LOUISIANA WITNESS. The last we sold was at 2¼ cents a gallo

Senator McLEAN. And you get how many gallons?

Mr. CHAPMAN. Four and one-half gallons to a ton of cane—11 pounds to the gallon. The argument I make is this: As I sa blackstrap molasses is a by-product material. The sugar people w get their protection on their sugar and no amount of protection in th world will cause one pound more of this by-product material to be pr duced. The molasses means little to the sugar interests; it mea everything to our farmer and our feed-manufacturing interests.

Senator CALDER. About 8 per cent of all blackstrap molasses domestic product?

Mr. CHAPMAN. Eight per cent of all blackstrap molasses used he has been a domestic product for the last seven years on the avera In the year 1920 this country produced only 5.3 per cent of the blac strap molasses used in the United States.

Senator CALDER. Do you include the beet industry?

Mr. CHAPMAN. I am not dealing with the beet industry at th present time, for the reason that I am speaking on blackstrap, whi is a cane product.

Quoting further from this farmer's bulletin—I am doing this leave in your minds the idea that this is something that the farm wants, that the farmer needs as a supplemental product to his ow feed. On page 51 of this bulletin it says [reading]:

> Molasses feed and other miscellaneous concentrates are in much demand in sa sections of the corn belt.

Again it says [reading]:

> Molasses in combination with other feeds makes a feed that is very palatable cattle.

Further [reading]:

> Blackstrap molasses can usually be bought at a price that justifies the farmer buying it by itself and mixing it with the feed grown on the farm.

And the item that I particularly desire to have you note is on page 2, in which it states [reading]:

In Illinois cottonseed meal and linseed meal constitute the bulk of concentrates in nearly equal proportions. In Iowa the records indicate the use of molasses feed to be as general as cottonseed and linseed meal combined.

Further, it says [reading]:

Molasses or any other sweet feed in the rations can be fed until shipping time without bad effects.

We are submitting statements showing the imports of blackstrap molasses since the year 1914, official figures, which I will not take the time to read; also the American production of blackstrap molasses as taken from the yearbook published by the Louisiana Sugar Planters' Association of New Orleans. I have done this to substantiate the statement I have just made in regard to the quantities imported as related to the quantities produced in this country.

Mr. CHAPMAN. I desire also to direct your attention to the magnitude of this feed-manufacturing business. The principal use of blackstrap molasses in times of peace is in compounding feeds for live stock. In the past 10 or 15 years an enormous industry has been built up in this country manufacturing balanced rations of all kinds for live stock, using it as the essential basic ingredient. Large factories employing thousands and thousands of laborers and other employees, with investments probably totaling $200,000,000, and producing approximately 3,000,000 tons of balanced rations, are located in every section of the country. In fact, in some centers the mixed-feed industry has become one of the leading industries. Aside from these industries located at the principal cities on the Pacific coast, mills are situated principally in the leading railroad centers east of the Rocky Mountains.

Mills manufacturing these mixed feeds are located about as follows: Kansas City, 5; St. Joseph, Mo., 2; Omaha, Nebr., 2; Clinton, Iowa, 2; Cedar Rapids, Iowa, 2; St. Louis, Mo., 2; East St. Louis, Ill., 5; Cairo, Ill., 2; Peoria, Ill., 2; Chicago, Ill., 8; Hammond, Ind., 3; Milwaukee, Wis., 2; Minneapolis, Minn., 3; Cincinnati, Ohio, 4; Pittsburgh, Pa., 2; Buffalo, N. Y., 5; Memphis, Tenn., 12, Nashville, Tenn., 3; Little Rock, Ark., 4. And a gentleman just here from Memphis has told me that there are at least $6,000,000 invested in plants in Memphis, and those plants have a daily capacity of about 3,500 tons of mixed feed.

At Nashville, Tenn., there are 3; Little Rock, Ark., 4; and then there are hundreds of small plants controlled by farmers and cooperative associations for local feeding interests. In virtually all of the principal cities other than I have named there are single manufacturing plants.

Senator McLEAN. Is it for poultry feeding?

Mr. CHAPMAN. No, sir; but it will be. There is a movement on foot in that direction; there have been experiments made, and it is going to be used.

It is being used for the fattening of sheep in very large quantities. One concern in Illinois that fattens something like 50,000 sheep uses molasses as a fattener.

If it is the desire to increase the revenue, a high tariff will defeat that purpose, because molasses will not come in.

Senator SMOOT. What would you use in place of it?

Mr. CHAPMAN. It just will not be used if it is too high in price, and the farmers will have to make slower and more expensive gains in their feeding operations, and go back to the old long-period method.

I would like to speak to you in regard to the schedule. Where not above 48 per cent total sugars as the basic rate of one-fourth cent per gallon is proposed by paragraph 503.

There is no blackstrap molasses, as a matter of fact, that tests as low as 48 per cent total sugars. Extremely rare instances occur where such a test is shown, but when we get such a low test we are suspicious of that molasses, and feel that it has been adulterated.

We will submit for the record, gentlemen, statements of the three leading importers of blackstrap molasses, covering something over 150 cargoes, in one instance the importations of one concern running back from 1914 to 1920, inclusive, and we are showing you the chemical analysis and showing you the total sugar analysis made of those cargoes at the time they came in, and we do likewise with two other of the leading importers. You will note that the total sugar content on these shipments of blackstrap average 54 per cent total sugars by the Clerget method. Rarely does one get down to 48, which is the basic figure on this one-fourth cent tariff as proposed by the Fordney bill. Occasionally one will come in as high as 60 per cent total sugars, but the general average is 54.

(See Exhibits A, B, 1, and 2 in brief.)

Mr. CHAPMAN. As the Fordney bill is passed, virtually nothing will come in at one-fourth cent per gallon, although we feel that the House thought that they were placing a duty of one-fourth cent per gallon on blackstrap molasses. We base our opinion in regard to this on a letter received by one of the Minneapolis feed manufacturers from Congressman Fordney, in which Mr. Fordney stated that the committee understood that all blackstrap molasses would test under 48. So that we believe that the House intended to allow all blackstrap molasses to come in at one-fourth cent per gallon. As a matter of fact, the Fordney bill would assess a duty on the average blackstrap molasses of 1¾ cents per gallon or over. Basing it on the average of 54 per cent total sugars and slightly more than one-fourth cent for each 1 per cent total sugars over 48 per cent, there would be six additional quarter cents.

Senator SMOOT. That is, if it all came in at 54?

Mr. CHAPMAN. If it all came in at 54, but 54 is the average. Some of it runs as high as 60, and on that high-testing molasses you can readily see we would then pay over 3 cents per gallon, in fact, 3¼ cents; there would be another six points.

Senator SMOOT. Why do they allow the 60 per cent in molasses?

Mr. CHAPMAN. Blackstrap molasses is not a uniform commodity; it never has been and probably never will be. It varies greatly.

Senator SMOOT. Does not that come about by the failure of extraction of sugar?

Mr. CHAPMAN. That is one reason. The condition of the cane, soil conditions, weather conditions, efficiency of the extraction plant all have their bearing on the quality of the blackstrap molasses. It has been suggested, "Why do you not keep the high-grade stuff separate, as it is worth more and it should pay more duty?" There is no way to do that; it is not possible.

This molasses, which comes largely from the interior of Cuba, is made at sugar plants in the interior. The sugar content of blackstrap molasses is dependent upon a great many factors: The run of to-day from a given factory may test differently from the run of tomorrow. The molasses from an individual factory is all run into a large vat. The run of to-day must be mixed with the run of tomorrow, and this run of several weeks or months may be stored in one vat. This molasses is pumped out of the storage tank at the sugar factory, on the island of Cuba, for instance, and shipped in tank cars to the seaboard and put into an enormous storage tank which may contain the product of a large number of sugar factories. It can not be kept separate and is all run together. It is pumped out of this large storage tank at the seaboard into tank steamers and is brought to the American seaboard and is there pumped into other large storage tanks which may be partially filled with other molasses. There is no way in which the buyer when he purchases blackstrap molasses either in Cuba or in America can know what sugar content he is going to get.

He may buy on a guaranteed minimum of not less than 48 per cent total sugars, for blackstrap molasses rarely, if ever, runs under that figure, but he can not buy on a guarantee that it will not run over that amount. Blackstrap with him is blackstrap molasses. He works on general averages and does not and can not discriminate. Blackstrap molasses in one part of a tank steamer or tank car may test higher in sugar content than that in another part of the same tank steamer or tank car. No two chemists were ever known to get identical results from two samples drawn from any particular lot of blackstrap. There is no way of determining what you are going to get when you buy blackstrap molasses; consequently, there is no way of getting more money for that which may, under the proposed bill, pay a duty of 3¼ cents per gallon from that which may pay ¼ cent per gallon.

Senator SMOOT. In your brief you give figures showing the different percentages and the different shipments for a certain length of time?

Mr. CHAPMAN. We do. As an illustration, we have taken here six typical cargoes brought into this country from January to May of this present year, and we find that based on actual practice as compared to the duty which those shipments actually paid, and which those same shipments would pay under the proposed Fordney tariff, the increase in duty is 370 per cent.

Senator SMOOT. I think the committee understands now your wishes in the matter, and if there is any special question that you want to impress upon the committee, I wish you would do it and do it briefly, so they can get the whole picture in their minds, because it is a rather difficult schedule, and if you expect all of the Senators to go into the detail of this here I am fearful they will not get very much out of it.

Mr. CHAPMAN. I am fearful of that, too.

Senator SMOOT. Let me suggest to you that you just impress upon the members of this committee right now the points you want them to get, succinctly as you can, so they will understand it and read it.

Mr. CHAPMAN. I want to do that.

Senator McLEAN. Have you got the quantities there of importation?

Mr. CHAPMAN. I have the statement of importations and the statement alongside of it of the quantity produced in the country.

Senator CALDER. What are the importations?

Mr. CHAPMAN. For 1914 they were 71,098,507 gallons and Louisiana produced 11,000,000 gallons; in 1915 we imported 88,000,00 gallons and Louisiana produced 7,000,000 gallons; in 1916 w imported 110,000,000 gallons and Louisiana produced 14,000,00 gallons; in 1917 we imported 140,000,000 gallons and Louisiana produced 12,000,000 gallons; in 1918 we imported 159,000,000 gallons and Louisiana produced 16,000,000 gallons, and that is th greatest amount that Louisiana has ever produced in these years in 1919 we imported 156,000,000 gallons and Louisiana produce 6,600,000 gallons, and in 1920 we imported 179,000,000 gallons an Louisiana produced in that year 10,000,000 gallons.

Senator CALDER. What proportion of this blackstrap molass is used for the purpose of making alcohol?

Mr. CHAPMAN. As near as we can figure—and we have cover that also in our brief—in normal times 75 per cent of the molass is used for feed purposes. In war time we figure not more than 4 per cent was used for feed purposes, but the feed manufacturer an the feeders would have taken unlimited additional quantities they could have gotten them. But during the war alcohol was i such great demand for powder and other explosives, poison gase and so on, that the alcohol people took the molasses, and I do n think that the feed trade used over 45 per cent of the total molass produced in the country and imported.

Senator DILLINGHAM. What has it been since that time.

Mr. CHAPMAN. In 1920 we believe that 75 per cent of the molass was used for feed, and I will gladly tell you what we base our opini on; we base it on the known figures of one molasses distributi company. That one company in the years 1919 and 1920 averag for these years over 40,000,000 gallons annually to the feed trade.

Now, conservatively—I have talked with several of the oth importers and they think that is a conservative estimate—we d not believe that that concern handled more than one-third of th molasses to the feed trade. So that, granting that this one conc handled only one-third of the feed molasses, during those two yea the feed trade used approximately 120,000,000 gallons of blac strap molasses, and that would be equal to about 70 per cent of th total importations of those years.

Then, again, in the years 1917–18 this concern's average annu delivery to the feed trade were 21,000,000 gallons. Of cours those were war years; and on the same hypothesis of one-third, th feed trade during those war years would have used 60,000,000 ga lons annually, or about equal to 40 per cent of the importatio during the war years.

Gentlemen, this is a tremendous thing to the feed trade. It is million tons of molasses per year of imports.

Senator McLEAN. And your argument is that it does not displa corn and other mixtures?

Mr. CHAPMAN. Only to a slight extent. The extent only, pa ticularly in the fattening of cattle, it hurries the operation; it tak

iicker gains; they eat more corn while they are fed this molasses. i dairy use it causes the stock to drink more water and keep in nerally more thrifty condition and consequently eat more other ed.

Senator CALDER. It is an appetizer?

Mr. CHAPMAN. Just like your sirup on your corn cakes in the orning. The cotton planters of the South make their crop more onomically, as these molasses feeds are safer and more efficient ian the unmixed grains for work animals. These feeds are in very rge demand in the cotton-raising sections.

Alfalfa meal is not used appreciably as feed, except in molasses-ed mixtures. The business of hundreds of alfalfa-grinding mills Colorado, Nebraska, Kansas, Wyoming, New Mexico, and Okla-oma depends upon the success of the mixed-feed manufacturing ants. Unless the mixed feeds can be made at prices at which they ill sell readily, this important western industry of alfalfa milling will down and out. Alfalfa meal is the principal ingredient mixed with olasses, and what affects one affects the other. Alfalfa meal is a ng-haul commodity the same as molasses is a long-haul commodity, id the advanced freight rates have militated against both of these rincipal ingredients to the extent that they can bear no further andicaps and still be marketed. The grinding of alfalfa meal to be uxed with molasses amounts to hundreds of thousands of tons, and as created a market and a demand for alfalfa raised by the farmer i the country surrounding these alfalfa mills, and these farmers will e seriously affected unless the mixed-feed industry can go on.

I would like to say in conclusion—

First. That on account of the small amount of blackstrap molasses roduced in the country and the large amount required to be im-orted, the imported molasses necessarily fixes the price.

Second. The feeders can not afford to use molasses if the price is icreased as indicated by the House bill.

Third. No importer can undertake to import blackstrap molasses n an uncertainty of rate as proposed to the House bill.

Fourth. Blackstrap molasses must be segregated in the bill from ther molasses and sirups and be permitted to enter either duty free r at a low fixed rate of duty.

Fifth. Either the basic total sugar content as proposed in the bill ust be raised to an amount so that all blackstrap molasses may enter t the basic rate—that would require approaching 60 per cent total ugars—or it should be arranged to go back to the polariscope basis ist as used in all previous tariffs—35° by the polariscope would cover ll blackstrap molasses; or, inasmuch as the essential protecting the ugar schedule is the sucrose content, a basis which would consider ucrose only by the Clerget method could be adopted. The 40 per ent sucrose by the Clerget method would permit all blackstrap olasses to enter at the basic rate.

Sixth. The United States Tariff Commission in a pamphlet entitled Tariff Information Surveys," on the articles in paragraph 177 of the ariff act of 1913 and related articles, dated 1921, on page 93, states:

> The dividing line between high-grade and low-grade molasses might be fixed at 55 per cent of sweetening matter.

The Tariff Commission's suggestion would barely cover the averag[illegible] blackstrap molasses and would militate against the higher-testin[illegible] grades.

Senator SMOOT. Would you like to file a brief?

Mr. CHAPMAN. I would like to do so.

Senator SMOOT. You may file it, avoiding in it repetitions of sta[illegible]ments you have made orally, and it will be printed.

BRIEF OF GEORGE A. CHAPMAN, REPRESENTING THE AMERICAN FEED MAN[illegible] FACTURERS' ASSOCIATION, CHICAGO, ILL.

Blackstrap molasses is the final residue from the manufacture of sugar fro[illegible] juice of sugar cane from which no more crystalizable sugar can be extracted. [illegible] not suitable for human food. It was formerly all wasted, but of recent year[illegible] have been found for it.

Blackstrap molasses tests:

Sucrose by polariscope		[illegible][1]
Sucrose by Clerget method	per cent..	[illegible]
Reducing sugars	do....	14[illegible]

The sucrose and reducing sugars are in liquid form and are commercially un[illegible]talizable. None of these sugars can be profitably extracted. If they could [illegible] sugar manufacturer who produces the blackstrap molasses would do it.

In normal peace times it is estimated that an amount equal to 70 per cent [illegible] amount imported into the country is used for feeding to dairy cattle, steers, h[illegible] mules, sheep, and hogs, either direct or in the form of ready prepared balanced rat[illegible] These rations contain from 10 per cent to 60 per cent blackstrap molasses, the bala[illegible] being made up of alfalfa meal, crushed grain, grain screenings, cottonseed mea[illegible] other by-product materials.

During the war years probably not over 45 per cent of the amount imported [illegible] used for feeding live stock, due to the very heavy demand for alcohol requir[illegible] the production of powder and other explosives.

(The above estimates are based on the known figures of one distributing [illegible] whose average billings to the feed trade of blackstrap molasses for the years 191[illegible] 1920 approximated 40,000,000 gallons annually, and for the two war years, 191[illegible] 1918, 21,000,000 gallons annually. More would have been used by the feeder[illegible] war years if they could have gotten it. It is conservatively estimated that this [illegible]cern's sales to the feed trade could not have been more than one-third of the am[illegible] used by the feed trade. On this hypothesis the feed trade consumed an averag[illegible] 120,000,000 gallons annually during 1919 and 1920, and an average of 63,000,[illegible] gallons annually during 1917 and 1918. This is more than 70 per cent of the aver[illegible] annual importations for the years 1919 and 1920, and more than 40 per cent [illegible] average annual importations for the years 1917 and 1918; it is fourteen times a[illegible] as the average annual Louisiana production for 1919 and 1920, and four and [illegible] times as much as the average annual Louisiana production for 1917 and 1918.

A small percentage of blackstrap molasses is used for the production of vinega[illegible] yeast. A small percentage is also used with calcium arsenate to poison boll we[illegible] in the South and grasshoppers in the Western States. It is also used in small [illegible]tities by foundries in the preparation of cores. There are practically no other k[illegible] commercial uses for this low grade blackstrap molasses. Practically all [illegible] imported blackstrap molasses comes from Cuba. None of this is used or is suit[illegible] for human food.

Its principal use in times of peace is in compounding feeds for live stock. With[illegible] the past 10 or 15 years an enormous industry has been built up in this country ma[illegible]facturing balanced rations for all kinds of live stock, using Blackstrap molasses as t[illegible] essential basic ingredient. Large factories, employing thousands of laborers [illegible] men, and office employees, with investments probably totaling $200,000,000 [illegible] producing approximately 3,000,000 tons of balanced rations, are located in [illegible]

[1] This is far under limit of 40° provided in emergency tariff and former tariffs.

ction of the country. In fact, in some centers the mixed-feed industry has become ne of the leading industries. Aside from those industries located at the principal ties on the Pacific coast, mills are situated principally at the leading railroad centers ast of the Rocky Mountains. Mills manufacturing these mixed feeds in the leading enters number as follows:

ansas City, Mo	5	Hammond, Ind	3
t. Joseph, Mo	2	Milwaukee, Wis	2
maha, Nebr	2	Minneapolis, Minn	3
linton, Iowa	2	Cincinnati, Ohio	4
edar Rapids, Iowa	2	Pittsburgh, Pa	2

hicago, Ill	8		

Hundreds of small plants controlled by farmers and farmers' cooperative associations r local feeding interests; also individual plants located in the principal towns and ities in practically every State north and south, east of the Rock Mountains. In act, this has become one of the large industries of the country and was very thriving ntil unfavorable conditions developed, including the several advances in freight ates, which placed a prohibitive tariff on this long-haul commodity. Since then his industry has been struggling for its very existence. To continue to thrive and upply the farmers and feeders of the country with desirable rations, it must have ow-priced molasses.

The industry was built up on low-priced molasses, and a comparatively low tariff as always been placed against it. When the railroad rates began to advance, the ndustry began to go down. Because this product must be hauled long distances to its oint of manufacture and consumption, freight rates have always been a large part of te cost; in fact, on the imported molasses the transportation charges have always een the greatest part of its cost. An increased duty on blackstrap molasses would be he equivalent of another advance in freight rates and will put the finishing touches o this industry which is now struggling to keep going until conditions improve.

In the early part of this year the railroads which had been hauling not only the lackstrap molasses up from the Gulf ports and from Louisiana, but other supplies to he mixed feed plants, as well as the finished product out, saw this industry and this arge source of revenue to them rapidly dying and endeavored to come to the rescue y granting a reduction in the freight rates effective June 10, 1921, of approximately 25 per cent. Even now with molasses selling at the seaboard at the lowest prices ever known, and with the reduced freight rates, the entire molasses feed manufacturing ndustry is in the throes of despair. With molasses duty free or with a low duty it may be able to survive.

The beneficiaries of cheap molasses are the farmers of all sections of the country, the producers of beef, pork, and mutton, dairymen, and owners of horses and mules. Especially the farmers of the grain belt want the benefit of cheap molasses. It is not a grain substitute, but a supplement to grain, which practical feeders have found added to their grain and home-grown roughages, makes these materials much more valuable and efficient.

Molasses feed must not be considered as coming into direct competition with corn. On the contrary it causes an increased consumption of corn. It is a competitor of corn in feeding to the extent that table sirup is a competitor to corn cakes in human consumption. Both increase the appetite for corn, causes more to be eaten, and consequently quicker, cheaper gains in weight. The big molasses feeders in the corn belt are the big raisers of corn and they would not buy something to compete with what they already have if molasses was simlpy a competitor of corn. Molasses is an appetizing supplement to corn and is so universally considered and used.

Should the western cattle feeder be unable, through the high price of other concentrates and the withdrawal of the molasses feed industry, to obtain any concentrates to go with his native feeds and be forced to feed out his cattle through the old and long process of using straight grains, he will be deprived of a quick finish and a quick turnover and be unable to handle his cattle profitably on the very small margin which exists and has existed for several years between the price that he pays for his feeder cattle and the price that he gets for his finished cattle.

It formerly required about a year to fatten or finish cattle for market. Now with the use of blackstrap molasses in the ration the animals are finished in 75 to 120 days. This saving in time obviously decreases the expense of producing meat. A large proportion of sweet feeds is consumed right in the corn belt.

Farmers' Bulletin No. 1218 makes the following statements:

Page 21: "Molasses feed and other miscellaneous concentrates are in much deman in some sections of the corn belt. Molasses in combination with other feeds make feed that is very palatable to cattle. The blackstrap molasses can usually be bough at a price that justifies the farmer in buying it by itself and mixing it with the fe grown on the farm.

Page 22: "In Illinois cottonseed meal and linseed meal constitute the bulk of con centrates in nearly equal proportion. In Iowa the records indicate the use of molas feed to be as general as cottonseed and linseed meal combined.

Page 30: "Molasses or any other sweet feed in the ration can be fed until shipp time without bad effects."

The city people are benefited as their meat and milk are produced better an more economically, and team owners' hauling costs are reduced.

The cotton planters of the South make their crops more economically, as the molasses feeds are safer and more efficient than the unmixed grains for work anim These feeds are in very large demand in the cotton-raising sections.

Alfalfa meal is not used appreciably as feed, excepting in molasses feed mixtur The business of hundreds of alfalfa grinding mills in Colorado, Kansas, Nebrask Wyoming, New Mexico, and Oklahoma depends upon the success of the mixed fe manufacturing plants. Unless the mixed feeds can be made at prices at which th will sell readily, the important Western industry of alfalfa milling will go down a out. Alfalfa meal is the principal ingredient mixed with molasses, and what aff one affects the other. Alfalfa meal is a long-haul commodity the same as molasse a long-haul commodity, and the advanced freight rates have militated against of these principal ingredients to the extent that they can bear no further handicap and still be marketed. The grinding of alfalfa meal to be mixed with molas amounts to hundreds of thousands of tons and has created a market and a demand alfalfa raised by the farmers in the country surrounding these alfalfa mills, and the farmers will be seriously affected unless the mixed feed industry can go on.

Low-priced molasses makes it possible to feed enormous quantities of grain scr ings and other by-product materials produced in large milling centers such as Minn apolis, Duluth, Kansas City, Chicago, Buffalo, St. Louis, etc. These materials oth wise would have no market and would largely go to waste. The molasses mak many materials palatable which are otherwise unpalatable to live stock. Molas increases the digestibility of other feeds with which it is mixed; it causes live sto to drink more water and become generally more thrifty. Farmers, particularly the beef cattle raising districts, buy large quantities of barrel molasses when it can b obtained at satisfactory prices to feed with home-grown roughage and other materia from the farm. Molasses mixed feeds create a distribution and use for hundreds thousands of tons of cottonseed meal, linseed meal, and other by-product feeds.

Is it not the duty of Congress to build up and protect an industry which empl many thousands of citizens; which encourages and makes profitable the raising live stock, and has a large share in keeping down the cost of living to the entire publ

If it is the desire to increase revenue, that will be defeated by the high duty. I fact, the present high freight rates and other adverse conditions have already seriou checked the importation of blackstrap molasses for feed purposes. The proposed du as covered by the Fordney bill would place a duty of more than 1½ cents per gall on the average blackstrap molasses, and as high as 3½ cents per gallon on some of high testing blackstrap molasses. This is an astonishing rate when it is realized th blackstrap molasses can to-day be bought at gulf ports at about 3 cents per gall and recent sales have been made at North Atlantic ports as low as 2 cents per ga A duty of almost 100 per cent, with a possible 150 per cent, of the market price in country on the average blackstrap certainly would stop its importation. It is unq tionably true that the stoppage in the importation of blackstrap molasses, if the pr posed duty goes into effect, will result in actually less revenue to the Governme than if the duty is arranged so that all blackstrap molasses is permitted to enter a rate not to exceed ¼ cent per gallon.

H. R. 7456, on page 82, line 3, paragraph 503, provides: "Molasses and sir testing not above 48 per centum total sugars, twenty-five one-hundredths of 1 cent p gallon; testing above 48 per centum total sugars, two hundred and seventy-five o thousandths of 1 cent additional for each per centum of total sugars and fraction of per centum in proportion."

It has been represented that the proposed duty under the House bill would all all blackstrap molasses to come in at ¼ cent per gallon; that 48 per cent total suga would allow all blackstrap to enter at the basic rate. This is not so, for virtually n blackstrap molasses tests as low as 48 per cent total sugars by the Clerget meth

etermination, and in the rare instances of such low test the molasses is under suspicion having been adulterated. A fair estimate of the average analysis of blackstrap olasses would be at least 54 per cent total sugars by the Clerget method. This being e average, it will be seen that quite as much would run as high as 60 per cent total ugars as would run as low as 48 per cent, and the duty would be prohibitive even on e average test.

The basing of the duty on the percentage of total sugars is a basis which has never een used in any former tariffs. All former tariffs have been based on a polariscope est of not over 40°. Under this test all blackstrap molasses could enter at the fixed ate of duty. Under former tariffs there was no uncertainty to the importer as to what uty he would have to pay when the goods actually arrived in this country. Under he proposed bill no one could be certain, within a possible 3 cents per gallon, what he duty might be until arrival in this country. The Fordney bill does not provide he method of determining total sugar content.

We are given to understand, through testimony given by a representative of the Jnited States Bureau of Standards before the House Ways and Means Committee, nd otherwise, that the basis of determining total sugars will be the Clerget method. If the Clerget method is used, virtually no blackstrap molasses can enter at the basic ate of duty, unless the proposed bill is altered.

The average total sugar content by the Clerget method of 112 cargoes of blackstrap molasses imported by two leading importers of blackstrap molasses, namely, Penick & Ford (Ltd.), of New Orleans, La., and C. U. Snyder & Co., of Chicago, Ill., is about 54 per cent, as shown by the following itemized statement (Exhibits A and B):

We are informed that other importers' shipments average about the same.

Under the terms of the proposed bill and by noting the itemized statements of these two importers it will be seen that virtually no blackstrap molasses reaches the minimum of 48 per cent total sugars by the Clerget method, and that a total sugar content is occasionally reached as high as 60 per cent. With an average of 54 per cent total sugars, it will be seen that instead of assessing a duty of one-fourth cent per gallon, this bill assesses a duty on the average of more than 1¾ cents per gallon, and on some of the higher testing blackstrap molasses more than 3¼ cents per gallon, or more than 100 per cent duty based on to-day's American duty paid valuation for blackstrap molasses.

The attached statements, Exhibits 1 and 2, show six typical cargoes of blackstrap molasses imported by the American Sugar Refining Co. from Cuba during the early months of 1921:

Exhibit 1 shows sucrose content by polariscope, sucrose content by Clerget method, invert sugars, and total sugars by Clerget method.

Exhibit 2 is statement showing comparison of rates and amounts of duty applied to these six typical cargoes based on the actual duty paid under tariff effective prior to May 28, 1921, and amount of duty which would be paid on these same cargoes as proposed by the Fordney tariff bill.

The Fordney tariff would increase the duty over the actual duty paid 370 per cent. An inconsistency in the proposed Fordney bill might well be pointed out here in that the extra duty for each 1 per cent of total sugars over 48 is greater than the amount assessed on the original 48 per cent. Certainly if 48 per cent total sugars may come in for one-fourth cent per gallon, it is inconsistent to assess each additional 1 per cent two hundred and seventy-five one thousandths of 1 cent per gallon.

EXHIBIT 1.—*Sugar tests of six typical cargoes of blackstrap molasses imported by American Sugar Refining Co. from Cuba.*

Date of arrival at New Orleans.	Cargo No.	Sucrose by polariscope.	Sucrose by Clerget method.	Invert sugars.	Total sugars by Clerget method.
Jan. 14, 1921	29	28.1	35.75	15.78	51.53

Apr. 19, 1921	33	32.2	39.28	14.81	54.09
May 13, 1921	34	33.3	39.55	14.52	54.07

EXHIBIT 2.—*Statement showing comparison of rates and amounts of duty applied to the six typical cargoes of blackstrap molasses imported by American Sugar Refining Co. from Cuba referred to in Exhibit 1.*

Cargo No.	Gallons.	Total sugars.[1]	Actual duty paid.[2]		Duty based on Fordney bill as passed by House would be[3]—	
			Cents per gallon.	Total.	Cents per gallon.	Total.
		Per cent.				
29	478,253	51.53	0.27	$1,291.28	0.976	$4,567.75
30	524,146	46.80	.27	1,415.19	.200	1,048.29
31	653,063	53.48	.27	1,763.27	1.405	9,175.54
32	660,090	52.70	.24	1,584.22	1.233	8,038.91
33	662,324	54.09	.24	1,589.58	1.539	10,193.17
34	691.051	54.07	.24	1,658.52	1.535	10,607.63
Total	3,668,927			9,302.06		43,631.29
Average duty			.253		1.189	

[1] Total sugars: Sucrose by Clerget method plus invert sugar (reducing sugars).

[2] Actual duty paid on Underwood tariff: 15 per cent ad valorem, full duty, less 20 per cent for Cuba; appraised valuation 2¼ cents per gallon during first quarter 1921 and 2 cents per gallon since that time.

[3] Duty based on Fordney tariff as passed by House: One-fourth cent per gallon on molasses and sirups testing not above 48 per cent total sugars, and 0.275 cents additional for each per cent of total sugar, fractions in proportion, less 20 per cent for Cuba.

Percentage of increase duty based on Fordney tariff as passed by House over actual duty paid (Cuban), 370.

The Fordney tariff, as passed by the House, on the average of the six typical cargoes referred to above, on an ad valorem basis at present appraised valuation of 2 cents per gallon, shows the following comparison:

	Full duty.	Duty, allowing Cuban preferential of 20 per cent.
	Per cent.	*Per cent.*
Fordney tariff	74.3	59.4
Underwood tariff	15.0	12.0

Blackstrap molasses can not be kept uniform and can not be purchased at any specific total sugar content. The sugar content of blackstrap molasses is dependent upon a great many factors—the efficiency of the extracting plant, the condition of the cane, the season of the year, weather and soil conditions, etc. The run of to-day from a given factory may test differently than the run of to-morrow. The molasses from an individual factory is all run into a storage vat. The run of to-day must be mixed with the run of to-morrow, and the run of several weeks or months may be stored in one vat. This molasses is pumped out of the storage tank at the sugar factory, on the island of Cuba, for instance, and put into an enormous storage tank, which may contain the product of a large number of sugar factories. It can not be kept separate and is all run together. Even with this method of handling it does not mix, and different samples from different parts of a tank or steamer show widely different analyses.

It is pumped out of this large storage tank at the seaboard into tank steamers and is brought to the American seaboard and is there pumped into other large storage tanks, which may be partially filled with other molasses. There is no way in which the buyer when he purchases blackstrap molasses, either in Cuba or in America, can know what sugar content he is going to get. He may buy on a guaranteed minimum of, say, not less than 48 per cent total sugars, for blackstrap molasses rarely if ever runs under that figure, but he can not buy on a guaranty that it will not run over that amount. Blackstrap with him is blackstrap molasses. He works on general averages and does not and can not discriminate. Blackstrap molasses in one part of a tank steamer or tank can may test higher in sugar content than that in another part of the same tank steamer or tank car. No two chemists were ever known to get identical results from two samples drawn from any particular lot of blackstrap. There is no way of determining what you are going to get when you buy blackstrap molasses; consequently there is no way of getting more money for that which may, under the proposed bill, pay a duty of 3¼ cents per gallon from that which may pay one-fourth cent per gallon.

The cost of blackstrap molasses must be determined in advance of importation; otherwise, to handle it would be a commercial impossibility. The proposed tariff contemplates an unknown duty anywhere from one-fourth cent per gallon to 3¼ cents per gallon, to be determined after the cargo has arrived. If it were possible to import blackstrap molasses at the higher rates of duty suggested by this bill, if an importer were lucky in the lottery and drew some low-testing blackstrap molasses he would be placed in position to put other importers who might have received a high-testing lot temporarily out of business. No feed manufacturer would pay more for the one than for the other, for it could not be handled separately. Moreover, he could not get any more for his finished product than his competitor, who might be using a low-testing lot. On such a variation, which at the present time amounts to more than the market value for blackstrap molasses, no one could take the chance of importing molasses.

Before the emergency tariff the duty was 15 per cent ad valorem, less 20 per cent Cuban preferential, equals 12 per cent net. Based on peace-time valuations of 2 cents per gallon in Cuba, equals 0.24 cent, or practically one-fourth cent per gallon. To-day's valuations would be less than 1 cent per gallon in Cuba, resulting in a duty of one-eighth cent per gallon.

The emergency tariff now in effect calls for 24 per cent ad valorem, less 20 per cent Cuban preferential. equals 19.2 per cent net. On valuation of 2 cents per gallon in Cuba, equals 0.384 cent, or practically one-third of 1 cent per gallon. To-day's valuations in Cuba would be less than 1 cent per gallon, making the duty 0.192 cent, or about one-fifth of 1 cent per gallon.

The permanent tariff is being prepared for years of peace and not for an era of war. Blackstrap in peace years is primarily a feeding material. It is indispensable for the best utilization of millions of tons of farm materials produced in the United States, and a means of making more efficient and valuable the feed grains with which it is fed.

Before imported molasses can compete with domestic molasses it must pay high transportation charges. This in itself is splendid protection for domestic producers of this formerly wasted material. Transportation costs, before these goods reach a parity with domestic goods, are approximately as follows (cents per gallon):

Average freight and tank-car expense in Cuba from plantation to receiving station at Cuban seaport	1.5
Ocean freight from Cuban port to Mobile or New Orleans	1.5
	3.0
Proposed duty on 48 per cent total sugars added	.25
Proposed extra duty on average blackstrap testing 54 per cent total sugars of two hundred and seventy-five one-thousandths of a cent for each 1 per cent total sugars above 48 added	1.65
Total	4.90
Deduct for Cuban preferential	.38
Total transportation and duty expenses	4.52

landed at Mobile or New Orleans, without one cent to the producer for his product or compensation to the importer to cover his investment in large receiving storage tanks, pumping, interest, taxes, tank-car service, and profits.

American blackstrap molasses originates at points taking New Orleans or Mobile rate of freight. Even if blackstrap molasses was admitted free of duty and the Cuban producer received nothing for his molasses and the importer nothing for his services, selling expense, pumping, interest, taxes on his storage tanks both in this country and in Cuba, and on tank cars in this country and in Cuba, the transportation alone would amount to 3 cents per gallon before the goods could be brought to a port in the United States taking the same rate of freight as the stations in Louisiana where blackstrap molasses is produced, and this 3 cents per gallon transportation charge is equal to the present selling price of blackstrap molasses produced in the United States. Sufficient protection certainly for an article whose American market price to-day is not over 3 cents per gallon, and whose normal prewar American market price was not over 5 or 6 cents per gallon. (See statement giving analysis and price of importations, 1914 to 1920, inclusive.)

Blackstrap molasses is produced in the United States in only one restricted locality, namely, the southern part of Louisiana, and there are comparatively few producers of it. For seven years last past the United States has produced less than 8 per cent of its total requirements and only 5.3 per cent of its 1920 requirements.

The following statement shows the Louisiana production and the amounts imported for seven fiscal years from 1914 to 1920, inclusive:

Year.	Dutiable.	From Porto Rico.	From Hawaii.	Total imported.[1]	Louisiana produced in crop year.[2]
	Gallons.	*Gallons.*	*Gallons.*	*Gallons.*	*Gallons.*
1914	51,410,271	15,577,832	4,110,404	71,098,507	11,190,908
1915	70,839,623	12,004,811	5,202,913	88,047,347	7,016,338
1916	85,716,673	16,279,073	8,399,014	110,394,760	14,272,535
1917	110,237,888	18,751,212	10,979,383	139,968,483	12,544,435
1918	130,730,861	14,495,752	14,671,477	159,898,090	16,101,650
1919	130,074,711	15,118,678	11,065,996	156,259,385	6,649,242
1920	154,670,200	15,059,273	9,605,486	179,334,959	10,066,981
Total	733,680,227	107,286,631	64,034,673	905,001,531	77,842,089

[1] Data covering imports taken from Monthly Summary of Foreign Commerce of the United States, published by the United States Department of Commerce.

[2] Production in Louisiana obtained from yearbooks published by Louisiana Sugar Planters' Association, New Orleans, La.

There are also large quantities of refiners' refuse molasses produced in the United States, but this is brought into the country in the form of raw sugar and is the by-product in the refining process.

The feed manufacturers and live-stock feeders accept and believe in the principles of protection to American industry; they believe in a protective tariff on sugar sufficient to allow the American sugar-producing industry to live and prosper. Blackstrap molasses, however, is a by-product commodity, and no duty, no matter how high, will cause one gallon more of it to be produced. The amount which has been produced or which it is possible to produce in the United States is so insignificant compared to the amount which the feed manufacturer and the feed trade of the United States require that protection to the feed trade and the feeders can only come by either allowing blackstrap molasses free entry or by placing the duty so low as to encourage its importation. The feed trade begs of Congress the same protection for its industry in free entry or a low tariff on this, its essential basic raw material, as it grants to other American industries in a protective tariff on their products.

BEET MOLASSES.

It has been shown that the amount of American-produced blackstrap molasses available for feeding and manufacturing purposes is negligible compared with the amount required. Nothing thus far has been said about beet molasses produced in the United States and used in feeding and manufacturing. The amount of blackstrap imported and the amount of duty upon it will have little effect upon either the amount of beet molasses used or the price at which it will sell. Aside from the particular use of beet molasses in the feeding of live stock the demand for it in the manufacture of yeast and other articles for human consumption is rapidly growing. It probably soon will exceed the supply. While some beet molasses is used in feeding it is confined largely to feed for work stock, like horses and mules, and indeed in this class of feeds a premium is usually paid for beet molasses over blackstrap. Beet molasses produces a greener-colored feed than blackstrap, and there is always a demand for green feed. In feeding work animals it is not desired primarily to fatten them, and a smaller amount of molasses is used in these feeds than in feeds for cattle, sheep, and hogs. Again, beet molasses when used liberally in feeds has a tendency to scour the animal, whereas as much blackstrap can be used as the mixture will absorb. This runs as high as 60 per cent of the molasses ration, or 20 to 30 per cent of the total concentrates given the animal. Beet molasses and blackstrap molasses, therefore, come into but limited competition with each other. The uses of the one so far differs from the uses of the other as to make the import duty on the one have little bearing on either the consumption or the price of the other.

There is in normal times sufficient demand in the United States for beet molasses which blackstrap can not satisfy to more than absorb the supply, which fixes the price of beet molasses above the price of blackstrap.

A free entry of blackstrap or a low duty on blackstrap does not imperil either the amount of beet molasses which will be used or the money value of the crop. There is not sufficient American supply in either beet or blackstrap molasses to meet the demand in normal times.

CONCLUSION.

1. On account of the small amount of blackstrap molasses produced in the country and the large amount required to be imported, the imported molasses necessarily fixes the price.

2. The feeders can not afford to use molasses if the price is increased as indicated by the House bill.

3. No importer can undertake to import blackstrap molasses on an uncertainty of rate as proposed by the House bill.

4. Blackstrap molasses must be segregated in the bill from other molasses and sirups and be permitted to enter either duty free or at a low fixed rate of duty.

5. Either the basic total sugar content as proposed in the bill must be raised to an amount so that all blackstrap molasses may enter at the basic rate (that would require a figure approaching 60 per cent total sugars), or—

It should be arranged to go back to the polariscope test as used in all previous tariffs (35° by the polariscope would cover all blackstrap molasses), or—

Inasmuch as the essential in protecting the sugar schedule is the sucrose content, a basis which would consider only sucrose content by the Clerget method could be adopted. (Forty per cent sucrose by the Clerget method would permit all blackstrap molasses to enter at the basic rate.)

6. The United States Tariff Commission, in pamphlet entitled "Tariff Information Surveys," on the articles in paragraph 177 of the tariff act of 1913 and related articles, dated 1921, on page 93, states: "The dividing line between high-grade and low-grade molasses might be fixed at 55 per cent of sweetening matter."

The Tariff Commission's suggestion would barely cover the average blackstrap molasses and would militate against the higher testing grades.

It would be presumptuous on the part of the feed trade to suggest the method for fixing the basis for the enforcement of the proposed law. Congress and the Government departments in their wisdom should do this; but the feed trade desires with all the emphasis at its command to impress the committee with the necessity of fixing some basis whereby all blackstrap molasses, as it is produced and offered for sale, may enter either duty free or at a rate of duty which will not exceed one-fourth of 1 cent per gallon. If this is not done one of our country's most important industries can not go on, and the farmers and feeders will be deprived of an important economic commodity at a reasonable price.

STATEMENT OF GEORGE H. FORSEE, REPRESENTING KANSAS CITY (MO.) HAY DEALERS' ASSOCIATION AND MISSOURI RIVER FEED MANUFACTURERS.

Mr. FORSEE. Mr. Chairman, I would like to say that this is my fourth trip to Washington on this matter since early summer, and considering that I have here been that many times with the understanding that I would be heard on behalf of the interests that I represent, I would appreciate it very much if you would give me the opportunity either now or to-morrow morning of making a statement. I am speaking for some thirty feed mills along the Missouri Valley and for the Kansas City Hay Dealers' Association. On each of my trips to Washington we have had to pass the hat among ourselves to get money enough to pay my expenses, as there is not an institution in these two industries which can afford to have its representative here and pay his entire expense. I am, therefore, representing the entire group from my section of the country.

Senator SMOOT. Misery likes company.

Mr. FORSEE. Yes, sir. That is the condition of our industry on the Missouri River. It takes me two nights and a day to make the trip each way, and having made the trip four times, two for the House hearings and two for the Senate hearings, I feel that I can not go home again and report to our people that I made no effort to be heard in their behalf. I would, therefore, most earnestly request that if our time has expired to-night, or is about to expire, you will hear me as far as you can to-night and give me a few minutes to-morrow morning to complete my testimony.

The CHAIRMAN. You may go ahead, if you only want a few minutes.

Mr. FORSEE. I do want more than a few minutes, Senator; that is just the point. I fear that our hearing will not be considered very important if we seem to be willing to state our case in a few minutes and let it go at that. The molasses hearing is scheduled with the sugar hearing, and we have listened to two days of testimony on sugar, and now if we are willing to have our own end of it—the molasses end—only indifferently presented within 30 or 40 minutes' time I fear that you will think that we are not of sufficient importance as an American industry to be worth protecting.

The CHAIRMAN. The committee is anxious to protect you and in great sympathy with you; but you, like the committee, want to get this bill passed promptly.

Mr. FORSEE. I will say what I have to say as rapidly as I can. If my time has expired before I am through you can so indicate to me, and I will quit. Speaking under pressure, I can possibly boil down what I have to say. Gentlemen, here is the proposition as

we see it in a nutshell: There has grown up in America a system of scientific feeding of live stock. The average man used to feed the stock which he kept on his farm only for the purpose of using his surplus grains and marketing them in that way. But it was found that the American farmer could add to his farming industry another industry, that of feeding cattle for the market. When the farmer began to feed for the market—feeding to put fat on—he realized that his old system of feeding was too slow. That his grains alone and his roughage would require too long a time to round out his cattle and to turn the money which he had in them. Then he found that there were certain concentrates which he could use in connection with his home-grown materials and that the combination would permit him to greatly shorten his feeding period. He could then get his money out of these cattle, reinvest it in another bunch of cattle if he so desired, thus continuing to consume the materials which he raised, and make more money by this process and market more home-grown feeds than he could by the old process. At first he was confined in the use of concentrates principally to two—linseed-oil meal and cottonseed meal. These were obtainable only at comparatively high prices. Usually they were much higher than his home-grown feeds. Then the feeding value of blackstrap, or refuse molasses, was discovered. It was very cheap—seldom, if ever, higher than his home-grown feeds. Not only did this enable him to buy a much cheaper concentrate than he had been able to buy before, but he found that it could be used also as a base for many materials which he could not use before. Many grains and cereals which in themselves were unpalatable made the finest kind of feed when mixed with this molasses.

Again, when a shortage of feeding materials occurred in one section, or a complete shortage of all materials occurred in that section, other materials native to other sections could be gathered at terminal markets, mixed with blackstrap molasses, and be ready to supply the feeders' needs. Thus was not only the section which was short on feeds supplied, but a market was created for grains, cereals, and by-products in the sections where they were plentiful. Feeding operations were thus stabilized and made more certain and greatly reduced in cost. This necessity and demand of the farmer and feeder gave birth to the molasses mixed-feed industry. We who are in the business felt that we were so close to the farmers—so closely identified with his industry, an industry which was primarily producing the bread and meat for the country—that our business was well-nigh impregnable, so far as the common disasters of business are concerned. For instance, we thought that whatever the folks down East here might suffer from the ills following a war, we in the meat-raising and grain-growing sections would be able to furnish all the country with meat and bread at a cheap price, and would be busy all of the time in doing it. Gentlemen, you know the situation now as well as I could possibly bring it to you from my section. The farmer and feeder is almost worse off than anybody, and we in our industry are flat on our backs.

The CHAIRMAN. Can you tell us what agricultural or industrial establishment is not flat on its back?

Mr. FORSEE. No. We are all in the same boat.

The CHAIRMAN. From the Atlantic to the Pacific Ocean that is so.

Mr. FORSEE. We feel, gentlemen, that this tariff on blackstrap molasses as it comes to you from the House will double or treble or possibly quadruple the cost of this molasses, or at least the cost of entry under previous tariff bills. That means that if the schedule as written in the bill by the House is maintained when the bill is passed by Congress that this burden is immediately borne by the farmer and feeder, and I submit, gentlemen, that he is the first man in the United States who ought to have his burdens lightened instead of added to, as he is the basis of the rehabilitation of us all.

Another objection which we urge to this schedule is that it is on a graduated scale. This tariff, as I understand it, runs all the way from one-fourth cent a gallon, based on 48 per cent total sugars, up to about 3 cents a gallon. We do not know, and the farmer does not know, so far as sugar content is concerned, what kind of molasses he is going to get; therefore under this bill none of us know what it is going to cost. But this we do know, that whatever it costs in tariff duties above those of previous bills, the farmer and those allied with the farmer are going to pay for it.

In addition to the live-stock-feed milling industry I oppose this schedule on behalf of the Kansas City Hay Dealers' Association. The hay industry is very large in our section of the country and, like the feed-milling industry, is very closely connected with the farmer and his interests. Alfalfa hay is largely used in connection with blackstrap molasses, and the means of marketing a very large part of this hay is through blackstrap-molasses feed. Hence the interest in this bill of the hay dealers, and back of them the hay-raising farmers.

Senator SMOOT. Would you be satisfied with the rates named in the Payne-Aldrich bill?

Mr. FORSEE. I understand the Payne-Aldrich bill provided a 20 per cent ad valorem duty and that the tax under that bill was about a quarter of a cent per gallon. I think we would be satisfied with that one-fourth cent if we can not get free entry of this essential raw material.

Mr. CHAPMAN. The Payne-Aldrich bill was on an ad valorem basis, and we do not want an ad valorem basis if we can avoid it. We would rather have the quarter-cent specific duty.

The CHAIRMAN. We did not know very much about that blackstrap molasses in the Payne-Aldrich bill; it had not been used as extensively as it is now.

Mr. CHAPMAN. Very true.

Senator CALDER. Twenty per cent was the ad valorem rate.

Mr. CHAPMAN. We do not want the ad valorem rate.

Senator SMOOT. Do you want this blackstrap molasses to come in at 58 per cent and 60 per cent in some cases? The Payne-Aldrich bill did not treat that kind of molasses with any 20 per cent ad valorem.

Mr. FORSEE. It is impossible for us out in our part of the country to determine grades of blackstrap molasses by these technical differences. We know blackstrap molasses as blackstrap molasses. If molasses can be brought into this country for the purpose of feeding, molasses from which no more sugar can be extracted, and it is possible to designate and fix such molasses upon some such costs as we have

had in former bills, then we can hope to get our feeding business back on its feet.

Senator CALDER. Does the witness know whether the corn men and meal men are in favor of this product coming in?

Mr. FORSEE. Do you mean the corn grower?

Senator CALDER. Yes.

Mr. FORSEE. I am, myself, a manufacturer of molasses feeds in the corn belt. My biggest customers are the biggest users of corn, and I might say the biggest growers of corn as well. There is no fight between corn and molasses. Molasses supplements corn and is fed with corn and raises the digestible value of the combination ration. Corn has a digestible value of about 79 per cent; blackstrap molasses has a digestible value of about 90 per cent. Animals eating molasses with corn digest their food better, drink more water, are kept in better condition, and consume more feed which is turned into fat quicker than when they are fed on the same old dry grain ration as corn—corn all the time.

The demand for blackstrap molasses for feeding comes from the corn belt, and the same people who raise corn and sell it to us—and we put corn in all of our mixtures—are the same people who turn around and buy mixed feed with the molasses content in it. For cattle feeding, sheep feeding, and hog feeding the corn grower and corn feeder want all of the molasses that the mixture will absorb, and this will run as high as 60 per cent molasses.

Senator CALDER. What I had in mind was whether you knew whether the corn men and meal men were very much in favor of legislation to put this on the free list?

Mr. FORSEE. You mean the farmers?

Senator CALDER. Yes.

Mr. FORSEE. I do not know of any organization of farmers that is acting one way or the other. We have, however, one of the biggest feeders in our section of the country sitting here with us.

Senator CALDER. I am thinking of the corn growers and the farmers chiefly. What is their attitude?

Mr. FORSEE. They want cheap concentrates. If you take molasses away or raise the price of molasses, you will force them into giving up their cheapest concentrate. They will then have to fall back on such things as cottonseed meal and linseed-oil meal for a concentrate, and they will always cost more than molasses. Indeed the use of cottonseed meal and linseed-oil meal is greatly helped, the value is greatly increased, by feeding molasses with them, and the price of these concentrates is brought down. The farmer must have something to feed with his home-grown grains. He must shorten his feeding period. He must reduce this period from six months or a year under the old method to 75 or 100 days. At least he wants to do this, and knows that he can do it by scientific feeding.

It has been only since the advent of molasses feed that there has grown up in the West the cattle-feeding business as a business. It is incident to farming in our section of the country, it is necessary in farming, and the combination farmer and feeder is the one who does best in both lines. Feeding has taught the farmer to turn over his investment as often as possible, and it has brought other up-to-date business methods to the farm. Of course, there are a large number

of men—or, at least, there were—who feed cattle as a business and who do not necessarily farm, but the records show that 80 per cent of the cattle feeders are both farmers and feeders. That is about the only class that we have left, as there have been millions lost in the cattle business the last several years, and hundreds of cattlemen who thought they were comfortably fixed for life have been wiped out as clean as the top of this table [illustrating].

Senator SMOOT. The Payne-Aldrich bill provided 20 per cent on molasses testing not above 40 degrees; 40 degrees and not above 56 degrees, 2 cents per pound; above 56 degrees, 6 cents a gallon. Are those duties satisfactory to you?

Mr. FORSEE. I do not know, Senator Smoot; I am not technical enough to know how these things figure out. I simply know that this traffic will not stand, in a tariff way, more than around a quarter of a cent per gallon, and I also know that a great American industry and a great agricultural industry will be enormously helped if this material, nearly 90 per cent of which we can not get in this country, is permitted to come in free. I understand that the 40 per cent spoken of is 40 per cent by the polariscope, whereas this bill fixes the duty, or duties, on a sliding scale of sugar content. We want a maximum of a quarter cent a gallon, and as much under that as possible.

Senator SMOOT. In molasses testing what degree? Forty degrees is one thing, but 60 degrees is quite another thing, because you can take 60-degree molasses and you can make sugar of it, I think, profitably.

Mr. FORSEE. If you will trace a cargo of molasses through to us in Kansas City you will not have any fear sugar will be made out of it. But here is the point in regard to a sliding scale: I can not go out to a feeder and say, "I want more money this time for the same feed that I sold you last week, because this feed has molasses in it that tests 57 per cent sugar, whereas the feed that I sold you last week had molasses in it that tested 52 per cent sugar." We can not operate on a scale of that kind.

Senator SMOOT. You have been operating all the time on it, ever since you first made the product.

Mr. FORSEE. It has all been sold to us at a definite fixed price; there has been no difference in price between one tank car coming to us and another. If there has been a difference in the tariff duty between cargoes coming to America, it has not been reflected in the sale price to us. I am not a molasses importer, neither am I a molasses expert, and sucrose and Clerget and polariscope and the other technical terms used in these hearings I know nothing about except what little I have absorbed from these hearings. But I do know that here is a product that we have been selling to the farmer at a fixed price and to meet a long-felt want, and that under the proposed bill, with a sliding scale of duty, the tariff will run from a quarter of a cent up to 2.75 cents a gallon, which will make it almost impossible to merchandise the material.

There is just one other thing I want to touch on here that has not been touched on, and that is the difference in the use between cane molasses and beet molasses. I feel that unless this is made clear you will not realize that there is a marked difference in the use of

these two in feeding. I manufacture both cane and beet molass feed. Beet molasses is used in horse and mule feeding almost en- tirely; cane molasses is used in cattle, hog, sheep, and dairy feedin almost entirely. We do not sell feed with beet molasses in it fo fattening purposes, for the reason that beet molasses is quite lax tive, and when it is put into feeding rations in comparatively lar amounts, say 40 to 60 per cent, it produces scouring. Only a limite amount of molasses, or a limited percentage, is used in horse and mul feeding, as the purpose of that feed is not to fatten the animal, as the purpose in feeding meat animals. Beet molasses makes a gre feed, and the average horse and mule owner likes green feed and wi ordinarily pay more money for it than for a brown feed. Blac strap makes a dark-brown feed usually. Horse and mule feed usually retailed a few sacks at a time, and the greener it is the bett the dealer can sell it. There will always be a sufficient deman this country for a green feed to absorb the supply of beet molass and this demand will be quite independent of the demand for the use of cane or blackstrap. I am speaking, of course, of norm times. At the present time there is little demand for anythin In addition to this particular demand in feed for beet molass there is an increasing demand for it for the making of yeast vinegar, and we, in the feed business, will have to compete in th matter of price with the yeast and vinegar people in the purchas of beet molasses if we are going to continue to supply a green fee This combination of uses will, in my judgment, not only more th absorb the beet supply, but it will fix a price for beet independ and higher than the price for cane. I do not consider, therefor that cheap cane molasses will affect either the amount of be molasses used or the price of beet molasses in the market.

STATEMENT OF FLOYD M. WILSON, REPRESENTING ALFALF MILLING INDUSTRY OF COLORADO, WYOMING, NEW MEXIC AND KANSAS.

Mr. Wilson. I am here to represent the interests of alfalfa mills in Colorado, Wyoming, New Mexico, and Kansas. We have in t West a comparatively new industry, the milling of alfalfa.

The use of alfalfa meal is dependent almost wholly upon blackst molasses, and that is the reason we are here. If the molasses i dustry is affected, and if the tariff is such as to make the importat of blackstrap for feeding purposes prohibitive, the big alfalfa-milli industry in the West will have to go out of business.

Senator Smoot. Does that industry use beet-sugar molasses?

Mr. Wilson. We ship all the meal we manufacture to eastern a southern markets, Senator, and it is there mixed with blackstrap some beet molasses; but when business conditions are normal there not nearly enough beet molasses for feed mixing to supply the deman at least I am told so by our customers. You understand that simply grind the alfalfa hay into meal and sell it direct to the mix feed plants in the South and East.

At the stockyards in Denver I am advised that oftentimes they cane molasses, or blackstrap, in feed mixtures in preference to be

That is all I care to say, gentlemen. The marketing of alfalfa m is almost entirely dependent upon the use of blackstrap molasses.

(Following is the brief of Mr. Wilson:)

The purpose of this brief is to bring to the attention of the Finance Committee the ;ee relationship existing between the blackstrap-molasses industry and the alfalfa illing industry, showing that the outlet for alfalfa meal is dependent almost wholly on the commercial availability of blackstrap molasses at a relatively low cost; rthermore, that the enactment of the Fordney tariff bill as it now stands would sult in raising the cost of molasses-alfalfa feeds $2 to $3 per ton, which would add the economic problems of cattle feeders as well as other users of mixed feeds, curiling the demand for alfalfa meal, thereby seriously injuring the alfalfa milling dustry and, indirectly, the alfalfa farmer.

The alfalfa milling industry is engaged in the grinding of alfalfa hay into a mealy oduct, which is commercially known as alfalfa meal. This meal is packed in 0-pound sacks and marketed direct to the farmers, feeders, and mixing plants roughout every section of the East, South, and Midle West, the principal markets ing Tampa, New Orleans, Birmingham, Little Rock, Memphis, Cairo, St. Louis, ansas City, Omaha, Cincinnati, Chicago, Milwaukee, Minneapolis, Norfolk, Philadelia. Pittsburgh, Buffalo, and Boston. To-day there are approximately 75 alfalfa mills st of the Missouri River, representing an investment aggregating $3,000,000. These ills are located in rural communities, and their successful operation means not ly much to the farmers in affording a convenient cash market for their product, t a great many thriving little towns in the West are dependent to a marked degree on the labor pay roll of the alfalfa mills, In fact, we do not think there is an instry in the United States that works as close to the field and farmer and upon hich the farmer is locally so dependent. Therefore, if the "home" alfalfa-hay arket is not to be disturbed and the thrift and growth of country towns is not to impeded, nothing should be done through the enactment of a tariff bill that will ifle or slow down alfalfa milling—so distinctly a rural enterprise.

During the period of depression the past year alfalfa mills have been forced to spend operations the greater part of the time. High freight rates have demanded heavy toll. However, with the resumption of the feed business now in sight and further reduction in freight rates contemplated, it would, indeed, be disastrous if ese economic benefits would be more than offset by a tariff which would result in creasing the cost of alfalfa-molasses feeds. This character of feed has the indorsent of all practical feeders and farmers, as well as State agricultural colleges and vernment feed experts.

We believe it is a fact that as much as nine-tenths of the blackstrap used by feeders imported from Cuba. If this statement is true (and Government reports and statics so indicate), the free entry of blackstrap molasses would result in far greater onomic benefit to the farmers and stock growers than could possibly be derived by ing a duty on this sugar by-product. We believe the tariff as fixed by the Fordney ll would prove commercially impracticable. The importer would be unable to termine just what a cargo of molasses would analyze until after it had reached the rt of entry, and therefore could not make "future" quotations to the feed trade on flat per-gallon basis. The feeder is little concerned as to variations in sugar content d will not pay a premium for molasses carrying a relatively higher percentage of gar. Alfalfa-molasses feeds necessarily are cheap and bulky products, which will t admit of going on a scientific chemical-analysis basis except where a wide range analyses is allowed. If blackstrap molasses is admitted on a flat basis, with the nge of sugar content from 48 to 60 per cent, it would allow the importer to figure ith a degree of certainty the cost of his product. On the other hand, if the duty assed would be from one-fourth cent to 2½ cents per gallon, according to sugar ntent, the molasses market would be in a chaotic condition and the mixed-feed dustry would be demoralized and discredited with the farmer and feeder on account varied and constant fluctuations in price.

The protein analysis of alfalfa meal varies from 11 to 17 per cent. Oftentimes the reener hay will run much lower in protein than hay that is off color. It would be st about as practical to sell alfalfa meal on an 11 per cent minimum basis, with an ditional charge of 25 cents per ton per each per cent of protein over 11 as it would attempt to sell blackstrap molasses to stock feeders where the import duty varies m one-fourth cent to 2½ cents per gallon. The low-priced stock-feeding industry is sed on too close a competitive basis to admit of such constant variations in the st of raw materials.

Again, we would respectfully call your committee's attention to the fact that the alfa milling industry of the West is dependent almost wholly upon the commercial ailability of blackstrap molasses for feeding purposes. Alfalfa meal is the only own absorbent, in the line of feed, for molasses. A free entry of blackstrap or a w duty on a flat basis will help to insure the life and prosperity of the alfalfa illing industry.

STATEMENT OF FRANK C. JONES, REPRESENTING THE EASTERN FEDERATION OF FEED MERCHANTS, BULLVILLE, N. Y.

Mr. JONES. I am going to try to be just as brief as I possibly can. From the record it would show that I am representing the Eastern Federation of Feed Merchants, which is an organization composed principally of retail feed merchants throughout the East. I am asking nothing in their behalf, but what I shall ask will be for the dairy farmer of my section.

In order to ascertain how much blackstrap molasses is being used for feeding purposes in the territory of the organization, I sent on December 1 a questionnaire asking a few more than 300 dealers these questions:

> How many tons of feed containing molasses have you sold during 1921 or have under contract for delivery prior to December 31 this year?

The second question was:

> How many gallons of feed molasses have you sold during 1921 or have under contract for delivery before December 31 this year?

The members of this committee, and especially the members who come from New England and Pennsylvania and New York State, know that the farmers of those States buy almost their entire requirements of commercial feeds; in other words, they grow none on their farms excepting some roughage. The result of this questionnaire:

We received 1 or 2 more than 200 returns, and it showed that [illegible] were handling molasses and molasses feeds. The total number of tons of molasses feeds that were handled by these 200 men was 14,839 tons. The total number of gallons of molasses in its raw state as sold by these men was 358,300 gallons.

The membership of the Eastern Federation is scattered over the six New England States and New Jersey, New York, and Pennsylvania, and there are more than 6,000 dealers in these nine States.

On the basis of the ratio of 2 to 1 obtained by the questionnaire, 4,000 of the 6,000 dealers are handling molasses and molasses feeds. Therefore if 200 dealers sold 14,839 tons of molasses feeds and 358,300 gallons of molasses, it is fair to assume that the 4,000 have sold twenty times these amounts, or 296,780 tons and 7,166,000 gallons of molasses.

The manufacturers of molasses feed tell me that the average amount of molasses used in molasses feeds is 30 per cent of the weight, or [illegible] gallons per ton of feed. Following out the calculation on that basis, 296,780 tons require 14,839,000 gallons of molasses, or a total number in molasses in feed and in liquid molasses of approximately 22,000,000 gallons.

Importers of blackstrap molasses submit figures which show that the average of blackstrap contains 54 or 55 per cent of total sugars. Under the proposed schedule, the average blackstrap would pay [illegible] cents per gallon duty, which applied to the 22,000,000 gallons would amount to a trifle over $330,000. This amount seems small as figures go these days, but it is to be placed on those who are engaged in an industry who are unable to stand this. I speak of the dairy farmer.

If other conditions of the dairy farmer of my section were in his favor, perhaps he would not feel this three hundred and thirty thousand and odd dollars. But to-day he is forced to pay $90 to $150 apiece for [illegible]

dinary grade cow. This cow is forced to the limit of milk production, d she is all through in about three to five years. Then here is what ppens: A good customer of mine about three weeks ago had two cows at were not with calf, and their milk production had fallen below the nount that would bring him any profit, and he put them in a car d shipped them to the Jersey City market along with some stock some other farmers. They sold for the enormous sum of 1½ cents r pound, Jersey City. Out of that he had to pay freight and mmission, and when he returned home, after paying $5 car fare, th no other expense, he had just exactly $14 for his two cows. iree years ago he could have received for those two cows in the me market perhaps not less than $60 or $75 each.

So when it comes to the selling of his stock, after he is all through ith it, he gets nothing for it.

In the little village where I live there are two creameries receiving ,000 or 12,000 quarts of milk daily to be shipped to New York. ist before I left home, I learned that one of these would pay $2.30 r 100 pounds for 3 per cent milk for November. Allowing the erage to be 3.8 per cent butter fat, the dairyman receives $2.62 r hundredweight, or 5.58 cents per quart. Deduct from that nount what he has to pay for the commercial feeds, and he will ive approximately 3¾ cents per quart, out of which he has to pay e hired man, if he is fortunate enough to find one, taxes, interest, id other incidental expenses.

Some Member over in the House of Representatives made the statement that the demand for the reduction has not come from the conimer. I frequently call on the feed and grain stores all over the secon of the territory which I represent, and talk with their customers s they come and go. I have in at least 100 instances brought up the uestion of duty on blackstrap molasses, and I find that they are nalterably opposed to it, and have used the same argument that I ave used, that they can not afford to pay any more than they are aying at the present time.

One month ago the dairymen of this very section were represented efore this committee by Mr. Holman, the secretary of a large assoiation of milk producers; by Mr. Putnam, of New Hampshire; Mr. ess, of Maine; Mr. Leech, of Vermont; and Messrs. Bronson and ambeen, of Massachusetts, asking for an upward revision of the riff as to milk and milk products.

I respectfully submit that, in my opinion, it would seem to be consistent if Congress, with its strong right arm, hands out to those airymen protection for milk and milk products and, with the other, ikes away by imposing a duty on the very essentials of milk prouction that they are forced to buy.

These 6,000 retail feed merchants are the men who rub elbows with he dairymen every business day in the year and know some of his roblems. They visit the farms; they see the cows milked, and they now at least some of the problems, and they help to carry some of he financial burdens.

I made that statement not very long ago to a small bunch of men, nd some joker in the crowd said:

At the end of the month, you take his milk check and apply it to the feed bill and ite a note for the balance.

I am a frank believer in the protection of American industry, bu in this instance the industry is so small in comparison with the thre that are already suffering—namely, the dairyman, the stock feeder and the feed manufacturer—that I am prone to ask for their benefi that blackstrap molasses be permitted to enter this country free o duty.

STATEMENT OF J. B. EDGAR, REPRESENTING EDGAR-MORGA CO., MEMPHIS, TENN.

Mr. EDGAR. I appear representing the feed manufacturers of Mem phis. I want to indorse Mr. Chapman's remarks and his brief, which I think will cover the case fully in a general way.

Memphis is a very important point in the manufacture of mixe feeds. There are 12 mills there representing an investment o $12,000,000, employing more than 1,000 men, and with a capac of some 3,500 tons of feed daily. That industry is on its back to-day as are all industries connected with agriculture, and it is my fir belief that anything added to the cost of our basic raw materia— blackstrap molasses—will mean bankruptcy for a large number concerns in that business.

I am not going to take your time with explanations, but I will as the privilege of making a statement in writing.

The CHAIRMAN. You may file it.

(The brief is as follows:)

The manufacturing of mixed feeds is one of the largest industries of Memphi There are 12 feed mills located in Memphis, with a total daily capacity of more th 3,500 tons. These mills represent an investment of more than $6,000,000, and em at least 1,000 people in various capacities.

The feed business at Memphis has grown rapidly since the introduction of blac strap molasses as a feed material. Because of its palatability and effect on the dig tive system, blackstrap molasses is a necessary ingredient in mixed feeds for m purposes. It is the basic raw material of the industry. There is no other feedi stuff which can economically take its place in modern scientific feeding schedul The large feed-manufacturing industry is thus dependent upon the availabi of an adequate supply of blackstrap molasses at a reasonable price. By the u blackstrap molasses our cotton growers and live-stock producers effect an enor saving annually in their feeding cost.

The feed manufacturer of Memphis is barely existing during the present busin depression. In my judgment, the mixed-feed industry will be practically destro if the prohibitive tariff on blackstrap provided under the Fordney bill is added our present difficulties.

The feed manufacturers of Memphis ask that blackstrap molasses be placed the free list in order that the feed industry and the live-stock feeders of this coun may be protected on their basic raw material, an otherwise useless by-product, ab 8 per cent of the quantity used being produced in this country. The American pr ducer of blackstrap, who supplies such a small percentage of the total consumpt already protected by the high cost of transportation in Cuba, the ocean freight handling charges, which amount to several times the value of blackstrap in Cuba.

The mixed-feed industry has developed under a tariff of approximately one-fo cent per gallon. If that duty is retained in the present tariff bill it should be ma a specific duty, as buyers of blackstrap can not afford to import it if the duty is ba on a sliding scale which will figure from 1 cent to 3 cents per gallon, dependin sugar content, as provided under the Fordney bill. Blackstrap is not bought feeders or manufacturers on the basis of sugar content. Blackstrap should, therefo be defined, so as to admit at a flat rate all blackstrap molasses from which it is profitable to make a further extraction of sugar. I approve of the amendment paragraph 503, suggested by Mr. Chapman, representing the American Feed Ma facturers' Association, and I heartily indorse his brief as the logical presentation of t facts in this case.

BRIEF OF GRAY SILVER, WASHINGTON, D. C., REPRESENTING THE AMERICAN FARM BUREAU FEDERATION.

SUMMARY.

Summarizing the arguments set forth herein, namely—

That the alcohol manufacturers are using a smaller and the feeders a much larger proportion of the supply of blackstrap;

That less than 10 per cent of the requisite supply is produced in the continental United States and only 25 per cent in the United States and its island Territories;

That the ordinary market price at seaboard points represents only about 20 per cent of the price which the farmer-feeder must pay in order to get the blackstrap laid down at his feed yard;

That the feeders in 47 States of the Union are, or may be, interested in buying this feed, whereas only the people of one State could be benefited by a high tariff;

That the alcohol manufacturers will not approve the idea of using corn instead of blackstrap in their seaboard plants because of the heavy expense of transporting corn to the seaboard; and

That molasses does not displace corn and other feeds grown throughout the country, but rather supplements them and makes them more valuable—

We are convinced that the country requires even less tariff duty on blackstrap than is contemplated in the Fordney bill.

We would make the scale less steep on the lower grades of molasses—up to, say, 60° sugar content—while on the higher grades comprising the molasses and sirup made by a distinct industrial group, intended for table use rather than recognized as a by-product, we would raise the duty to somewhat higher levels.

A DISCUSSION OF THE TARIFF.

The tariff act of 1909 fixed a duty of 20 per cent ad valorem on molasses testing not above 40° polariscope test, with a specific duty of 3 cents per gallon on molasses testing above 40° and not above 56°, while on molasses testing above 56° the rate was 6 cents per gallon.

Under the 1913 act the duty was decreased one-fourth, making it 15 per cent ad valorem on grades testing not above 40°; 2¼ cents per gallon on grades ranging from 40 to 56°; and 4½ cents per gallon on grades testing above 56°.

This polaric test is not satisfactory for molasses because it is not a true index of the sugar content. As a consequence, most of the molasses imported has been in the lowest of the three grades. As the greatest part of the imports came from Cuba, which country receives preferential treatment to the extent of 20 per cent reduction of the regular duty, practically all of the molasses imported since 1913 has paid a rate of 12 per cent ad valorem (see table). The value in Cuba of molasses imported to the United States under the tariff act of 1913 has averaged about 5 cents per gallon. At an ad valorem rate of 12 per cent this is equivalent to a specific duty of six-tenths of 1 cent per gallon. In 1914 and in 1920, however, the Cuban price was approximately 3 cents per gallon, hence the duty at 12 per cent ad valorem amounted to slightly more than one-third of 1 cent a gallon.

Under the emergency tariff the duty on Cuban molasses rests at 19.2 per cent ad valorem, making the duty 0.58 cent per gallon on 3-cent molasses.

THE FORDNEY BILL.

The Fordney bill undertakes to change the method of testing molasses, basing the duty upon the percentage of sugar content. Paragraph 503 of the proposed law provides that molasses and sirups testing not above 48 per cent total sugars shall pay 0.25 cent per gallon, while grades testing above 48 per cent total sugars shall be assessed 0.275 cent additional for each per cent of total sugars over and above 48.

To the Treasury officials, of course, is left the option of determining the method of making the sugar test. To ascertain the total sugar content, however, it is necessary to use the Clerget method. Thirty-three tests of blackstrap molasses, made by Penick & Ford, of New Orleans, show an average sugar content of 55 per cent.

According to other good authorities, the sugar content of all grades of molasses will range from 50 per cent to 75 per cent. Taking 55 per cent, or degrees, as the test of average blackstrap molasses, the duty under paragraph 503 of the Fordney bill would

be 2.17 per gallon [1] from countries other than Cuba and 20 per cent less, or 1.7 cents per gallon, from Cuba.

By this same schedule a high-grade molasses, testing 71° sugar, such as the cane-juice sirup produced in the Southern States, and from which no sugar has been extracted, would carry a duty of 6.57 cents per gallon generally, or 5.26 cents per gallon if from Cuba.

IMPORTS OF BLACKSTRAP.

Referring to the tables of imports, it will be seen that over 90 per cent of the total amounts coming in are Cuban blackstrap. General imports have increased rapidly, advancing from 31,000,000 gallons in 1910 to 154,000,000 gallons in 1920, Cuban products always constituting close to 100 per cent of the importation. This shows among other things:

1. That the demand for molasses has increased very rapidly.
2. That Cuba is able to supply all normal requirements.

USES OF MOLASSES.

Molasses is put to numerous uses. The higher grades are commonly used on the table. A considerable quantity also is consumed in bakeries. The two main channels of demand, however, lead to mills manufacturing stock feed or to stock feeders, and to distilleries. There are no definite figures showing the division between these two major uses. Penick & Ford, of New Orleans, say that in normal times practically 90 per cent of the blackstrap is required for stock-feeding purposes. The American Cane Growers' Association claims that two-thirds of the supplies from Cuba, amounting to about one-half of the total stocks of blackstrap, is used by the distillers. It has been estimated by the American Feed Manufactures' Association that 35 per cent of the blackstrap molasses imported is used for stock-feed mixtures. As most of the domestic supply is used as feed, the 30 per cent of the imported supply said to be used as feed, plus the local production, would amount to practically one-half of the total available. Thus it appears that the cane growers and the feed manufacturers are at agreement in their estimates.

The Federal Trade Commission, in a bulletin issued on March 29, 1921, "Report of the Federal Trade Commission on Commercial Feeds," says on page 60:

"It is not practicable to give a satisfactory estimate of the proportion (of blackstrap) used as feed. It may be stated that the two main uses of this commodity are for the production of alcohol and for feeding purposes. The division of the supply between these two uses differs greatly at different times, depending on various factors, such as the relative price of molasses and other raw materials for alcohol manufacture (particularly corn) the demand for alcohol, and the demand for sweet feeds. The control of the supply of blackstrap is practically in the hands of the producers of alcohol."

Referring to the above statement that the control of the (imported) supply of blackstrap is practically in the hands of the producers of alcohol, the Federal Trade Commission report explains, on page 167, that since 1919 the United States Food Products Corporation has initiated and developed a strong hold upon the business of importing Cuban blackstrap, indicating that more and more of this product will go into foods and feeds.

It is stated unofficially that the Federal Trade Commission considers the present distribution of blackstrap between the two main consuming industries to be 60 per cent to the feeders and 40 per cent to the distillers.

The question of the use of blackstrap can be settled with reasonable definiteness by constructing a table to show the approximate total annual supply and the amount consumed yearly in the production of distilled spirits. While absolutely accurate conclusions can not be drawn from these slightly unsatisfactory figures, the trend can at least be depended upon.

The aforesaid table showing the supply of low-grade molasses and the amount used by the distillers makes very clear that as short a time ago as 1913-1915 the distillers were using most of the blackstrap imported to the United States feeders were getting only 8 per cent to 20 per cent, or thereabouts, of a small supply, while in 1920 there were left for feeders or other users, after the distillers had their requirements, 46 per cent of a very large supply. While the amounts of molasses used by the dis-

[1] The duty is 0.25 cent per gallon if test is not over 48° sugar. For each degree above 48° it is 0.275 cent additional. A sample testing 55 pays 0.25 cent plus 0.275 cent times 7 equals 1.92 cents, giving a total of 2.17 cents.

tillers have increased rapidly, the amounts used by feeders have doubled and trebled several times.

This table is of further interest to show the proportion of the total molasses supply produced at home and imported. About 40 per cent to 70 per cent comes from Cuba, 8 per cent was produced in Louisiana in 1920 (including first, second, and third centrifugals), and 16 per cent to 20 per cent, as a rule, comes from Porto Rico and Hawaii.

MOLASSES AS A FEED.

Cane blackstrap molasses was considered a waste product until a few years ago. Its first use by feeders of stock was as a condiment, to render other feeding materials more palatable. Following its successful use by Louisiana sugar planters as a feed for work mules, however, its popularity spread rapidly. It is not a complete food, being almost a pure carbohydrate, but it is one of the important ingredients of a balanced ration.

Molasses is palatable, easily digestible, and generally plentiful and low in price. Many patent mixed feeds now in the market contain 10 per cent to 40 per cent of molasses. It may be mixed with alfalfa, cottonseed or linseed meal, cracked corn, crimped oats, and numerous mill feeds. Large numbers of farmers and stock feeders prefer to buy the molasses and do their own mixing. A method followed profitably by many feeders is to sprinkle molasses over hay, cornstalks, or other rough feed which probably could not be utilized as feed without making it appetizing and more easily digestible.

Since molasses is becoming a competitor of other feeds, the tariff problem assumes greater importance than ever before. Its feeding value, pound for pound, is said to equal that of corn. As a gallon of molasses weighs 12 pounds, only 4⅔ gallons are required to equal a bushel of corn. At 5 cents per gallon corn would have to be as low as 23 cents per bushel to displace molasses. The price of molasses frequently has been much less than 5 cents at the source of production, but during the war it was much higher. The American Cane Growers' Association claims that the farmer ought to have 6 cents for his molasses. This would put molasses as a feed material on a parity with 28-cent corn.

The big problem is to determine how far imported molasses competes with corn and other domestic feeds and how far it is a supplementary feed. Molasses is not a complete feed in itself, as is corn. Its virtue lies largely in its ability to improve other kinds of feed. Hays and fodders are worth much more when sprinkled generously with molasses than when fed alone; cracked corn and molasses mixed make a better feed than corn alone, while molasses is never fed alone, except that it is said sugar-plantation mules learn to drink it and really prefer it in that way to any other.

It seems idle, therefore, to speak of molasses feed proving injurious to the corn growers and feeders. Rather is it becoming more and more a necessity to all feeders.

MOLASSES AND INDUSTRIAL ALCOHOL.

There is one situation outside of the feed province in which molasses competes to the apparent discard of corn, namely, the production of industrial alcohol. In the discussion of the uses of molasses above it is shown that a very large proportion of the total supply of blackstrap has gone to the distilleries. Of course, it is understood that most of the alcohol now produced is put through a further process of manufacture called denaturation, and that the denatured alcohol is in great demand in the industries. Statistics on production and consumption of alcohol show a marked decline since the cessation of use for war and beverage purposes, but industrially it is of marked importance. There is a strong possibility of its coming into general use as a fuel to replace gasoline. In such an event every owner of an automobile will be a booster for Cuban molasses.

Reference to the tables on alcohol will reveal a decline in production (because two important uses were cut off), the 1920 output of distilled spirits being only 82,331,687 gallons, whereas in 1917 the product was 286,085,463 gallons. This is not a surprising revelation, but it is surprising to note that in 1920 more molasses was used to produce 82,000,000 gallons of distilled spirits than was used in 1917 to produce 286,000,000 gallons. On the other hand, over 40,000,000 bushels of grain were consumed in distilleries in 1917, whereas in 1920 only 2,500,000 bushels were so utilized. In other words, molasses became almost the only raw material used in the production of alcohol.

This situation was partly due to expediency, molasses being very readily convertible into alcohol and usually being low in price; also was more or less due to the appeals of the Government not to use grains for distillation purposes during the war

period. In 1921 there was a slight reaction in favor of grain, about 6,000,000 bushels being consumed by distillers. Possibly in normal times it will be found that inland distilleries located in the corn belt will prefer corn in order to avoid paying freight on molasses from the seaboard, whereas seaboard distilleries will desire molasses to avoid bringing corn from the interior. However this may be, it remains true that molasses is the principal material used in the production of industrial alcohol, and that industrial alcohol is a necessary commodity.

The question now resolves itself into one of policy toward industrial alcohol: (1) Shall the United States prohibit or tax heavily the importation of molasses for distillation purposes; or (2) shall the duty be fixed just high enough to put molasses on a parity with corn in cost to the distiller; or (3) shall the duty be left low enough to encourage the most economical and efficient production of industrial alcohol; or (4) shall the duty be fixed at a point to permit profitable use of Cuban molasses by the distillers and still afford sufficient protection to growers of sugar cane and feeders of stock in the United States? Discussion of these four phases of the subject follows in the order named.

1. *Relative to a high tariff.*—If the Government puts a prohibitive duty upon molasses, the distillers will be forced to use other materials. A policy such as this has been advocated by certain interests. It is said that a duty of 10 cents per gallon would keep molasses out and would cause distillers to use about 125,000 bushels of corn per day, thus helping the American farmer to market his corn. The advocates of this plan admit the importance of molasses as a feed, but they claim that the local production is sufficient for feeding purposes. They would put a duty of 40 cents per gallon on industrial alcohol to prevent the transfer of the industry to Cuba.

Such argument can not be maintained. Statistical Tables XII-A and XII-B, naming the materials and amounts of same from which alcohol is made reveal the fact that grain has almost gone out of use by distilleries and that practically all of the alcohol produced comes from molasses. If importation were prohibited, therefore, undoubtedly the distillers would become the strongest bidders for the molasses produced domestically, thereby taking the entire supply away from the feeders. The annual production of alcohol has decreased to such an extent, moreover, that only about 17,000,000 to 18,000,000 bushels of corn, approximately one-half of 1 per cent of the 1920 crop, would have been required by the distillers in each of the past two years if no other raw material had been used.

The demands for molasses for feeding purposes, on the other hand, could not have been met by domestic production, even though the entire supply had been put to this use. In 1920 the available supply (see Table II) of low-grade molasses was more than 209,000,000 gallons, little more than half of which was used by the distillers. Of approximately 95,000,000 gallons used for foods and feeds, only 17,000,000 gallons were produced in the United States, about 33,000,000 gallons were brought in from Hawaii and Porto Rico, leaving the feed manufactures, stock feeders, and sirup mixers to depend upon Cuban blackstrap to the extent of 45,000,000 gallons. If the duty on Cuban molasses had been 10 cents per gallon, undoubtedly none would have been imported, the distillers would have taken all of the local supply, and the feeders would not have received a gallon unless by paying an exorbitant price for it.

It is plain, therefore, that a prohibitive duty, or even a high duty, on molasses would injure the American farmers, producers of industrial alcohol, and consumers generally.

2. *Relative to placing molasses on a parity with corn in cost to the distiller.*—It is stated by good authorities that one bushel of corn will produce about 4.7 gallons of alcohol (1) and that a gallon of molasses will produce 0.6 to 0.85 gallon of alcohol. (2) Thus approximately, 6½ gallons of molasses are required to equal 1 bushel of corn for distillation purposes. To place molasses on a parity with corn, therefore, as regards cost to the distiller, would require a duty sufficiently high to make 6½ gallons of molasses cost as much as a bushel of corn.

The price of a bushel of corn is not stable; neither is the price of a gallon of molasses. Each fluctuates from day to day, depending largely upon supply and demand. A poor corn year in the United States may be a good molasses year in Cuba, resulting in unusually high prices for corn and low prices for molasses. If corn were 60 cents per bushel in the United States and molasses 2 cents per gallon in Cuba, the 6½ gallons equivalent to the bushel of corn would cost only 13 cents plus a small freight charge, consequently the desired parity could be established only by levying a duty of approximately 8 cents a gallon upon the molasses. On the other hand, if corn were 40 cents and molasses 3 cents, the proper duty would be in the neighborhood of 3 cents a gallon.

Fixing a duty upon molasses which would meet all such contingencies might be a suitable task for a theorist, but farmers, economists, and customs officials could not afford to be bothered with it. An import duty, in order to be administered, must be

stable. As it is certain that equality in cost between United States corn and Cuban molasses could only be established by means of an import duty which would fluctuate with every price variation of either corn or molasses, the idea is not practical. Only under fixed prices—Government price control—could such a relation be maintained

3. *Relative to encouraging the most economical production of industrial alcohol.*—There is no doubt but that industrial alcohol is a necessity. Demand for this product subsided very materially following the signing of the armistice, however, and peace requirements must increase manyfold before the maximum possibilities of production will be required. Reports issued by the Commissioner of Internal Revenue show that in 1918 the manufacturers used 68,803,050 gallons of specially denatured alcohol, while in 1920 a larger number of users consumed only 22,260,649 gallons. (Table XV.) Production of distilled spirits amounted to 286,085,463 gallons in 1917, while in 1920 the total was only 82,331,687 gallons. (Table XI.) The amount of alcohol subjected to the denaturation process has declined steadily from nearly 94,000,000 gallons in 1917 to 45,640,948 gallons in 1920 and to 38,812,138 gallons in the year ended June 30, 1921. (Table XIII.)

The marked decline in the use of industrial alcohol does not indicate an economic need of greater efficiency of production but rather it indicates an abandonment of war-time uses as well as an objection to the high prices of 1920. In July, 1919, nearly a year after the need of alcohol for war purposes was past, the price was down to 42 cents per gallon (Table XIV), having receded from the high level of $1 per gallon in July, 1917. In July, 1920, however, apparently without good cause, the price was $1.11 per gallon. It is said that the peak of blackstrap prices was reached in the summer of 1920, the feeders being required to pay 25 cents per gallon because of scarcity due to the loss at sea of two molasses tank ships and to transportation difficulties in Cuba. The chances are, however, that not many distillers paid this high price for blackstrap.

The extreme American price was not materially reflected in Cuba, and the Federal Trade Commission states that the importation of Cuban molasses has generally been controlled by the alcohol manufacturers. Mere delay in receiving supplies would not mean increased prices to those in control. The Federal Trade Commission bears out this view in showing on page 127 of its report on commercial feeds that the contract price of molasses during the first four months of 1920 was a great deal lower than during the corresponding months of 1919. For the year 1918 the average price per gallon was 20.28 cents; during the first four months of 1919 it was 16.71 cents; throughout the remaining eight months of 1919 it was down to 8.03 cents, while during the first six months of 1920 it was 10.20 cents.

It is true that the annual consumption of molasses for alcohol production has scarcely declined since the war, the millions of gallons used in 1917 being 112, in 1918 increasing to 118, in 1919 going to 123, and in 1920 receding only to 113.

This maintenance of the use of molasses at the maximum while alcohol production decreased over 70 per cent may be attributed to the fact that molasses displaced practically all other raw materials used by distillers. (See Table XII–B.) The ease with which molasses can be converted into alcohol assures it first consideration unless other materials can be purchased at comparatively lower prices.

In 1913 the distillers produced six times as much spirituous liquor from grain as they did from molasses, whereas in 1920 the production from molasses was nearly 12 times as great as it was from grain. (See Table XII–B.) If the price of molasses in 1920 had been 25 cents per gallon to the distillers, it would have been relatively cheaper for them to use corn,[1] yet Table XII–A shows that they used very little grain. The fact that the price of molasses in July, 1921, was about 2½ cents per gallon and of alcohol 32 cents a gallon shows that a spread of 29½ cents per gallon covered the additional expenses of production and an adequate margin of profit. Now if molasses cost several times as much in 1920 as in 1921, there is no reason for multiplying labor cost and profit by the same factor in order to determine the sale price. This ought to be an exercise in addition rather than in multiplication.

It has been claimed that a heavy export demand for alcohol caused the high industrial alcohol prices in 1920. Official records of exports, however, do not indicate a depletion of local stocks. In 1919 about 101,000,000 gallons of alcohol were produced, of which 12,000,000 gallons went to exporters and 60,000,000 gallons were denatured. This left about 29,000,000 gallons for other uses. In 1920 the production was unchanged—27,000,000 gallons were exported and 45,000,000 gallons were subjected to the denaturation process. Thus again about 29,000,000 gallons remained for utilization otherwise.

By reference to the tables on production (XIII) and use (XV), of specially denatured alcohol it is seen that in 1919 about 44,000,000 gallons (28,294,219 wine gallons)

---

[1] See price table on pp. 106 and 127, report of Federal Trade Commission on commercial feeds.

of specially denatured alcohol were produced and 47,000,000 gallons were consumed. In 1920, on the other hand, production exceeded consumption in the ratio of about 25 to 22. There does not seem, therefore, to have been a real shortage of alcohol.

Since the price of industrial alcohol in 1920 apparently was unjustifiably high, there seems to be no compelling reason to believe that a lower duty would bring more efficient production. Psychological considerations still would affect prices.

The day probably is coming, nevertheless, when alcohol will be required as motor fuel.

It is reported that Cuba is producing this kind of fuel for her own automobiles at half the cost of gasoline, and that she is developing an export trade to South America. When the day draws near for the extensive use of such fuel in the United States there may be occasion for the adoption of special legislation to encourage importation of molasses, but such considerations concern the future. In the meantime the duty should not be placed so high as to destroy the Cuban market or to weaken the industrial alcohol industry in the United States.

4. *Relative to a duty which will be fair to Cuban and American producers and to all classes of American consumers.*—From 1913 to 1920 the duty assessed on molasses by the United States certainly has been fair enough to Cuba, because annual receipts of Cuban blackstrap have increased approximately 500 per cent, molasses has almost completely displaced other materials in the production of alcohol and the sweet feed industry has grown to immense proportions. The reduction of general imports from 154,000,000 gallons during the fiscal year ended June 30, 1920, to 113,000,000 gallons for the year ended June 30, 1921, was not due to the emergency tariff law (which did not become effective until May 28, 1921, and which made only a very slight increase in the molasses duty), but to a marked decline in alcohol production.

As regards the American producer of blackstrap it is generally admitted that his product is superior to the imported supply, consequently more of it goes to the bakers, sirup and feed mixers than to the distillers, who get millions of gallons from Cuba at very low prices.

As local production is comparatively small, the price is fixed by the great mass of the imported product, consequently American sugar mills receive an average of about 3 to 4 cents per gallon for molasses in normal times.

One acre of land will produce approximately 15 tons of cane yielding 67½ gallons of molasses, hence at 4 cents per gallon the farmer is allowed for molasses $2.70 per acre of sugar cane harvested.

It appears, therefore, that the blackstrap producer might well be granted sufficient protection so that he might add 1 or 2 cents per gallon to the price of his product. Adding 2 cents per gallon would net him increased receipts of $3.33 per ton, or $1.35 per acre of cane cultivated.

Let us see, on the other hand, how an increase of 2 cents per gallon would affect the feed mixer and the farmer of the corn belt. Two cents per gallon on molasses means one-sixth of 1 cent per pound. Molasses is said to equal corn, pound for pound, in feeding value. Therefore 56 pounds of molasses, equaling a bushel of corn, would be increased in price 9⅓ cents. If the corn-belt farmer could purchase molasses at 5 cents per gallon, he would be paying a price comparable with 23 cents per bushel for corn; addition of the 9⅓ cents to cover the tariff duty of 2 cents per gallon would make feed cost 32⅓ cents per bushel. A difficulty now arising is that the farmer has to pay about 100 per cent extra to cover freight rates and the expense of distributing molasses in small lots, usually in barrels.

COMPARATIVE PRICES, CORN VERSUS MOLASSES.

Table III shows comparative prices of corn and blackstrap. These are average prices as quoted in official publications. The contract prices of blackstrap here used are considerably lower than the open-market prices during the year 1920; but as most of the blackstrap is said to be purchased under contract, probably the contract price is fairly representative.

In order to make possible a comparison of the prices of corn and molasses, the table shows in column 1 the price of corn, in column 2 the price of molasses at the seaboard, in column 3 the price of molasses with 3 cents added to cover freight from New Orleans to St. Louis or from New York to Cleveland, in column 4 the price of 56 pounds of molasses (the equivalent of a bushel of corn) plus 10 cents to cover the proposed duty, and in column 5 a price including an additional 6 cents per gallon (or 28 cents per bushel of corn equivalent) when purchased by the farmer in small lots, probably in barrels.

Study of this table arouses opposition to the proposal to add 2 cents to the duty on molasses. Column 5, representing the price to be paid by the farmer of the Middle

West, shows until 1917 a molasses price in excess of the price of corn. Probably the reason no fuss was made about it was that no data such as this table reveals have been published. Middle West farmers in those days were not using much molasses, hence they had no reason to consider the extra charge of 8 cents per gallon, 2 cents to cover import duty and 6 cents to cover barreling of the molasses Such price quotations as they saw or heard generally were for molasses in tank-car lots at factory or at seaboard points.

Even when bolstered up with these extra charges due to tariff, freight, and barrel shipments in small quantities, the price of molasses during the war period was below the price of corn. It was during the period of high prices incident to the war, moreover, that molasses feeds gained so great prominence.

Corn and molasses both are low in price at the present writing (December, 1921), but the composite table under review shows the blackstrap when made available for the farmer to be higher priced than corn. The 10 cents per bushel equivalent, proposed to be added as a tariff duty, appears to be the "straw which breaks the camel's back."

AN EQUITABLE TARIFF DUTY.

It was pointed out early in this paper that the present emergency tariff rate on Cuban blackstrap is about 0.58 cent per gallon. Reference once more to Table I shows that the rate proposed in the Fordney bill on Cuban blackstrap of the average total sugar content test (55°) is 1.74 cents per gallon, or an increase of 1.16 cents per gallon.

The study of the composite price table, comparing prices of corn and molasses, indicated that an additional duty of 2 cents per gallon would prove a heavy burden upon the farmers far removed from the seaboard. The same line of argument tends to prove that the tariff duty increase contemplated under the Fordney bill, namely, 1.16 cents per gallon, is too high.

Unless some method can be found to relieve the United States farmer on his tremendous costs of production, no good can come from the act of adding the equivalent of 10 cents per bushel to the cost of a feed which he needs and can not produce. Well-nigh tragical it seems to contemplate a feed heralded the country over as being purchasable at 3 cents per gallon, but which, before being available at the farmers' feeding pens must be augmented in price by 3 cents (100 per cent) for freight rate, 6 cents (200 per cent) for a container and the labor incident to putting it into same, and 2 cents (66 per cent) in the form of a tax. Although the Fordney bill proposes an increased duty of only 1.16 cents instead of 2 cents per gallon, the hypothetical case previously used of a 2-cent additional duty is continued in this connection because certain interests are asking that the basic rate in the Fordney bill be increased by three-fourths of 1 cent per gallon, making the 48° molasses dutiable at 1 cent per gallon and increasing all higher grades in like proportion.

Here is a table showing the duty per gallon on molasses testing 48° and up, as provided in the proposed law:

TABLE I.—*Duty proposed by Fordney bill.*

Molasses testing not above—	In general, cents per gallon.	From Cuba, cents per gallon.	Molasses testing not above—	In general, cents per gallon.	From Cuba, cents per gallon.

[1] Data from Yearbook of Louisiana Sugar Planters' Association.

[2] Molasses and sirup combined. Data from Monthly Summary of Foreign Commerce of the United States.

[3] Molasses only. Data from Monthly Summary of Foreign Commerce of the United States.

[4] Imports for consumption of molasses not above 40° (presumably all blackstrap).

[5] Exports are so small after deducting the amounts shipped from the Hawaii and Porto Rico consular districts, and so little of the molasses exported from the United States proper is known to be blackstrap, that it is thought best to disregard this column; consequently these amounts are not deducted in arriving at available supply.

[6] It is probable that in this year the distillers purchased larger quantities of molasses than they used, carrying over a considerable quantity to the following season. It is noted that the following year's recorded consumption was very light, but that production of spirits from molasses was much larger than in 1915.

TABLE III.—*Corn and blackstrap molasses.*

Year and month.	Corn, mixed, cash No. 3, Chicago, per bushel.[1]	Molasses, average net price for contract blackstrap in bulk f. o. b. storage plants New York, per gallon.[2]	Plus 3 cents per gallon, average freight from seaboard to interior.	Price of 4⅔ gallons (56 pounds) of molasses, plus 10 cents to cover duty at 2 cents per gallon.[3]	Plus 6 cents per gallon (or 28 cents per bushel of corn equivalent) for molasses in barrels as required by farmers.

STATEMENT OF L. H. ROBERTSON, CATTLE FEEDER AND FARMER, ABINGDON, ILL.

The CHAIRMAN. State your full name for the information of the committee.

Mr. ROBERTSON. My name is L. H. Robertson.

The CHAIRMAN. Where do you reside?

Mr. ROBERTSON. In Illinois.

The CHAIRMAN. What is your occupation?

Mr. ROBERTSON. I am a cattle feeder and farmer.

The CHAIRMAN. Will you make your statement to the committee as briefly as you can?

Mr. ROBERTSON. What I wanted to mention to you, gentlemen, is this—that our feeding industry has been hit very hard in the last two years. We think that we need everything that would be able to do us any good in making our cattle as cheap as possible. We find in feeding in connection with our corn that if we feed molasses feed with our grain we can produce our cattle quicker, put them in a higher state of finish by far than we could with the old methods.

My father fed cattle before me; I have fed cattle myself for over 20 years. In the early days when we used to feed cattle, we fed them anywhere from six months to a year. To-day we can take a steer and make him a very good beef steer in 70 to 120 days by new methods of feeding.

I want to give you an idea as to what I think of the value of molasses. I would say that I would consider it something we could hardly do without. We need it; we can shorten up the feed period, make a steer drink more; they eat a little more feed but gain so much faster.

The CHAIRMAN. What do you want to urge or advise in connection with this tariff bill?

Mr. ROBERTSON. I would like to see the Cuban blackstrap molasses come in on the free list; that would be my idea.

The CHAIRMAN. Have you any statement you desire to file with the committee?

Mr. ROBERTSON. Yes, sir; I will say that I am a member and director of an association called the Military Tract Shippers and Feeders Association, located at Monmouth, Ill., with a membership of about 3,000—possibly over that, maybe 3,500; and I just want to say in behalf of all the feeders that I know that they indorse the putting of Cuban cane blackstrap molasses on the free list.

STATEMENT OF E. WILKINSON, REPRESENTING AMERICAN COTTON GROWERS' ASSOCIATION, BIRMINGHAM, ALA.

Mr. WILKINSON. I represent the Alabama division of the American Cotton Growers' Association.

Our condition is a little different from the conditions that have been presented, as we are users of manufactured sweet feeds; and to save the time of the committee I would ask that we be permitted to file a written brief and not take up your time at this late hour, and would like to know when that brief would have to be here. I have none prepared.

The CHAIRMAN. You may prepare it and send it as soon as you can, and we will endeavor to find a proper place for it.

Mr. WILKINSON. We present an entirely different feature.

The CHAIRMAN. What particular feature do you desire to call the attention of the committee to?

Mr. WILKINSON. The increased cost of feedstuffs which we buy—we are not producers of our feeds, we are buyers—and the increased costs of those feeds and the effect it will have on the cotton-growing industry.

The CHAIRMAN. The committee will be very glad to give your brief careful consideration.

Mr. WILKINSON. Thank you, sir.

(The brief is as follows:)

My discussion of this subject will be confined to the effect of any increase in the duty on blackstrap molasses in excess of one-quarter of 1 cent per gallon when used for animal food.

The House bill provides a sliding scale, with a basis rate of one-quarter of 1 cent per gallon when total sugar content is not in excess of 48 per cent, and further provides an increased duty of $0.0275 cent per gallon for each additional 1 per cent of total sugars.

The brief filed by the American Feed Manufacturers Association shows the total sugars of many different cargoes. In one case only was the analysis as low as 48 per cent, while in some cases it ran above 59 per cent, and the average was 54 per cent total sugar. The average duty would therefore be $0.0165 cent per gallon, above one-quarter of 1 cent, less the preferential allowed on imports from Cuba. This would increase the cost of blackstrap molasses for animal feed over $2.25 per ton, and in the cases showing 60 per cent total sugar might run as high as $5.50 increase in the cost per ton.

Taking the average of 54 per cent total sugar, making the increased cost of $2.25 per ton for molasses, the cost of assembling the ingredients to manufacture a ton of molasses feed of the grades used in Alabama would be increased 78 cents. The manufacturer will add to this amount 10 or 15 per cent to cover overhead and profit, making his selling price to the wholesale dealer in Alabama about $1 per ton above the amount he would charge on the flat duty of one-quarter of 1 cent per gallon. The wholesaler adds his usual per cent to this increased price, and the retail dealer then adds his per cent of profit to the price he pays the wholesaler. The price increases with per cent of profit added to each preceding increase until the original cost of 78 cents in assembling the material has become not less than $1.50 when the feed actually goes into consumption.

It is this feature which directly affects the cotton grower in Alabama, because he does not produce his requirements of animal food and must buy a considerable part of his requirements.

From October 1, 1919, to October 1, 1920, Alabama used 6,200,712 hundred-pound bags of manufactured feed. This included dry dairy and poultry feed in amount less than 35 per cent of the total, leaving 65 per cent as molasses mixed feed, or 4,030,462 hundred-pound bags, equaling 201,523 tons. This, based on the average analysis of 54 per cent total sugar content of imported blackstrap molasses, would cost the Alabama consumer over one-quarter of a million dollars more than it would have cost on a flat one-quarter of 1 cent per gallon duty.

As some of this molasses tests 60 per cent total sugar, the importer will in all probability take no chance on the importation or on his profit, but base his selling price on the possibility of a higher sugar content with the increased duty and only sell at a figure which will give a profit on the 60 per cent basis as a duty cost. It requires a firm strong financially and with large resources and investment in equipment to import blackstrap molasses. The Fordney bill will furnish an excuse for quoting blackstrap based on the highest sugar content, and, consequently, a much higher duty, which in all probability would double the estimate of a quarter of a million as increased cost of feed for one year to the Alabama consumers.

You gentlemen accustomed to dealing with millions may regard this as a small sum, and I therefore ask that you examine into the ability of our cotton growers to assume this increased cost. A small sum means much more to one class of people limited in resources than does a much larger sum mean to another class with a greater income. I have been asked frequently if Alabama was very prosperous because of the recent advance in cotton values. In some quarters the idea seems to prevail that the Alabama cotton grower was reclining on a "bed of roses" or traveling "easy street." Nothing could be further from the facts.

A glance at the production of cotton in our State will clearly demonstrate the prostrate condition of our agriculture. From 1900 to 1910, inclusive, Alabama produced annually an average of 1,166,000 bales of lint cotton. (See table herewith.)

In 1910 the boll weevil made his first appearance in Alabama, and by 1915 the entire State was infested with this uncontrollable pest, threatening with extinction the entire cotton-growing industry. From 1916 to 1920, inclusive, the State produced annually an average of 713,000 bales. (See table herewith.)

Our crop for 1921 will be about 650,000 bales, or a little over one-half of the annual 11-year average from 1900 to 1910.

The State department of agriculture in a late bulletin shows the number of plows engaged in the production of cotton in Alabama for the crop year 1921 to be 354,000.

The vast majority of cotton grown in the State is grown on a rental basis, one plow usually representing one family, renting 20 to 40 acres of land; the rental usually being one-third of the cotton produced, the tenant keeping the corn and other crops, an agreement being made as to the number of acres of cotton to be planted. If rented for a cash rent it is from $40 to $50 per year on the average. In central and south Alabama the tenants are Negroes, and in the northern part of the State very frequently they are white farmers. In addition to cotton, they cultivate a few acres of corn, a "patch" of sorghum or sugar cane. The corn produced furnishes the family bread, and sorghum or cane boiled down on the farm to the form of sirup is the "sweeting" for the family. If thrifty, a pig or two is raised, which is the family supply of meat and lard. The corn grown will only supply food for the mule a part of the year, and molasses feed supplies the remainder. For cash the family depends exclusively on cotton. With 350,000 families engaged in the industry and a production of 650,000 bales, it is conclusive that the average family produced less than two bales of cotton in the year 1921.

At the present market values, two bales of cotton would bring about $160. From that must be deducted $30 for fertilizer and $40 for rent, and it is clear that the year's work would net about $90 or about $7.50 per month. Corn bread, molasses (home produced), and a little pork have eliminated to some extent the expense for food, yet the fact remains that suffering is very extensive and acute.

It is on these unfortunates, with an income of $7.50 per month cash, which must provide clothing, coffee, horse feed, schoolbooks, and other necessities, that this quarter of a million dollars will fall, by increasing to that amount the cost of the horse feed necessary to maintain their animals. It means to them the last straw which will "break the camel's back." The pressure since the boll weevil first appeared in 1910 is intense and has reached the limit of human endurance. Any increase in the cost of existence will mean greater disaster and increased suffering for many thousand families.

In their behalf I most respectfully urge this committee not to render their lot more hopeless, but limit their cost of horse feed by a duty on imported blackstrap molasses for animal food not in excess of one-quarter of 1 cent per gallon.

I desire to call your attention to one more point of deep interest to the Alabama farmer. In October last the legislature of our State passed a good-roads bill, which will result in the expenditure of $25,000,000 on State highways. Under the Federal act we hope for a like sum from the National Treasury. The best engineers and contractors advise that 20 per cent of the total cost of hard-surfaced road construction is feed for the work stock used in the construction. Twenty per cent of the $50,000,000 is $10,000,000, and within a few years this amount of feed will be used in the construction of Alabama roads. Molasses-mixed feeds are our cheapest source of supply under present conditions and have been for years past. A high-grade molasses-mixed feed manufactured under the present duty sells in Birmingham for $30 per ton. Ten million dollars will buy 333,333 tons. The Fordney bill would make the same feed cost at least one-half million more, and would probably result in an increased cost of about $1,000,000. This sum would build from 200 to 400 miles of hard-surfaced roads.

The necessity for good roads in Alabama is manifest, and their construction will grant material relief to the cotton grower described above. The per cent of illiterates in our State is very high. During the winter our roads do not freeze, and the nature of our soil (largely clay), with our heavy winter rainfall, produces a condition which renders them impassible, preventing children in rural districts from reaching a schoolhouse a large part of the year. Road improvement will make the schoolhouse accessible to thousands of children, greatly reducing our illiteracy.

To the one-plow farmer, with a cash income of $7.50 per month, improved roads will offer relief and renewed hopes. With their construction, milk, eggs, butter, and vegetables produced as a side line would find a market in the cities and could easily double and quadruple the cash income of the family. Under the present road condition it is impossible to reach a market with them a large part of the year. Alabama ships in from other States annually eggs, butter, milk, and cream to the extent of many millions, and is of itself an agricultural State. Impassible roads explain that condition, and every mile of good roads built will help very materially by offering this source of revenue to our farmers.

A fixed duty of not over one-quarter of a cent per gallon on imported blackstrap molasses for animal food will be acceptable. A sliding scale rendering uncertain the delivered price is not desirable.

The Louisiana and beet producer of molasses will unquestionably demand a heavier duty as protection to an American industry. I raise no protest at a duty on sugar

which will grant them protection on sugar as against the cheaper production of other countries. We desire to increase our production, but as the blackstrap is a by-product, and this country can produce only a very small per cent of the required quantity, it is unwise to tax a large number of users of molasses-mixed feed to protect a relatively few sugar producers. And especially is that true when the duty will be increased by a per cent of profit which the manufacturer, the wholesale dealer, and the retail dealer will add to the duty cost, and when passed on to the final consumer the duty of a few cents has assumed a size double its original proportions. Louisiana and beet molasses are not strong competitors, as each has its especial use and each its sphere of usefulness.

High freight rates and transportation cost prevent imported molasses from seriously injuring the beet product in the northern and western markets, and the same influence prevents the beet product from being a large factor on the eastern seaboard and Southern States. It costs for rail charges (the car furnished by the shipper) 2⅝ cents per gallon to move imported blackstrap from Mobile to Birmingham, a distance of about 240 miles, so that freight alone would furnish ample protection for the beet producer in the large consuming district where his product is used—namely, north of the Ohio and from the Mississippi west. The ocean carriage, freight to reach a Cuban port, loading and unloading is a charge against imported blackstrap in excess of its value in Cuba by 200 per cent, and added to a duty of one-quarter of a cent per gallon will give the Louisiana grower protection which would satisfy any fair producer, and any demand in excess of the amount above would be the demand of one who was oblivious to fair play and who would exploit a consumer by trust methods if given control of any situation.

Any duty above one-quarter of 1 cent per gallon will render less valuable to the States in the Southeast all State and Federal aid to good-roads construction. Every mile of good roads will mean better citizens and lawmakers to-morrow by education of the barefoot children of to-day. Every mile of good roads will also mean an opportunity for the overburdened cotton grower to diversify and market perishables that normally go with every good effort at agriculture, but have been impracticable in the cotton belt and will be impracticable until our roads are improved.

In the interest of a higher type of man and womanhood for the coming generation, and as simple justice to the family struggling to exist under the pressure of adversity, I ask that the duty be limited to not more than one-quarter of 1 cent per gallon, when for animal food.

I realize that war has made it necessary to raise immense sums to liquidate obligations, but believe this great Nation is too rich in resources to raise the needed revenue at the expense of illiteracy and from the income of homes where wheat bread and sugar are rare exceptions on the table and decent clothing and shoes for the children are unknown.

The Alabama Division of the American Cotton Growers Association, in the name of over one-third of a million families, most of them lacking the necessities of life, urge a modification of the Fordney bill and that the duty be a fixed and definite one of not more than one-quarter of 1 cent per gallon on imported blackstrap molasses when for animal food.

Lint cotton produced in Alabama.

[Figures taken from Alfred B. Sheperdson compilation of cotton production. Odd thousands omitted.]

Annual average	1,166,000	Annual average	650,000

1921 yield about 650,000 bales.

STATEMENT OF B. T. MANARD, REPRESENTING PENICK & FORD (LTD.), NEW ORLEANS, LA.

Mr. MANARD. I am representing Penick & Ford (Ltd.), dealers in both imported and domestic blackstrap. I will save the time of the committee by filing a brief.

The CHAIRMAN. Of course, you gentlemen will bear in mind that you are speaking to the same point, and it is really sufficient to file a brief.

(The brief is as follows:)

By adding to paragraph 503 the words "Molasses testing not above 40 per cent sucrose, one-fourth of 1 cent per gallon," you will permit the entry of only that grade of molasses known as "blackstrap" at the specific rate of one-quarter cent per gallon.

Dr. F. W. Zerban, an authority on sugar chemistry, advises that sugar can not profitably be extracted commercially from molasses testing as low as 35° by the polariscope or containing as little as 40 per cent sucrose. Sucrose is the table sugar which domestic sugar interests principally desire to protect. The crystallization of the sucrose in blackstrap is prevented by the presence in the liquid of a large per cent of ash, gums, and glucose or reducing sugars.

A review of remarks in the Congressional Record on pages 4406 to 4409, July 21, 1921, clearly indicates that it was the purpose of the House to provide for one-quarter of 1 cent per gallon on that specific grade of molasses called "blackstrap," but this object is unintentionally defeated by the application of the term "total sugars" to all grades.

Chairman Fordney, of the Ways and Means Committee, when presenting an amendment on July 21, 1921, is reported in the Congressional Record, page 4406, as saying:

"Mr. Chairman, this amendment reduces the duty on blackstrap molasses from 1 cent to three-fourths of a cent per gallon."

Eight days before, in replying to a letter from Brooks Elevator Co., of Minneapolis, Minn., in which they protested against duty on blackstrap, Chairman Fordney wrote: "It was committee's understanding that this sort of molasses, I believe, would test less than 48 per cent total sugars and be dutiable at 1 cent per gallon. I shall be glad to make inquiry and bring same to committee's attention."

The House eventually passed an amendment which was clearly intended to admit "blackstrap" at one-quarter cent per gallon, but on account of the misunderstood provisions the result shows a duty ranging up to 4 cents per gallon, or in terms used by feed manufacturers, $7 per ton. We ask that as much consideration be given to this error as is often given to a misplaced comma.

Blackstrap is handled by the dealers in large volume and on a close margin which requires terms of draft attached to bill of lading. To enable feed manufacturers to conduct their business efficiently, blackstrap dealers contract ahead for Cuban molasses and supply their customers as their requirements demand. It is not a speculative business, but occasionally something happens which causes much grief and every time it is the producer of domestic blackstrap that gets the benefit.

The latest case of this kind occurred in the spring of 1920, when importations were seriously interrupted by the sinking of two molasses tank ships which could not immediately be replaced. Buyer's contracts called for imported blackstrap at 8 cents per gallon. The feed manufacturers had orders for feed which had to be filled. The law of supply and demand worked as usual, and the domestic producers secured as high as 22 cents per gallon for their blackstrap.

Our Louisiana friends have had several tastes of high price for blackstrap. This year business has not been so satisfactory. If they want a good price in future the way to get it is to encourage an even larger demand instead of inadvertently seeking a prohibitive duty which would stifle those who make their product valuable. We recommend to them the fable of the goose that laid the golden egg.

STATEMENT OF JOHN M. ROGERS, REPRESENTING AMERICAN CANE GROWERS' ASSOCIATION.

Mr. ROGERS. I will not take up the time of your committee. With your permission I will also file a brief covering our position.

(The brief is as follows:)

The polariscopic test for molasses and sirups is not a true value test, as this method takes no account of the food, feed, or manufacturing value of sirups and molasses

the polariscope shows only one component—sucrose—when, in fact, the invert sugars not shown by the polariscopic test are of equal value.

This polariscopic test for molasses and sirups is inapplicable and unscientific. In the sugar schedule itself ample provision is made from the standpoint of refining sugars from liquors when intended for that purpose. The evident purpose and only thought of the framers of the law was that sirups and molasses were nothing more nor less than a form of or a potential source of sugar. New and entirely different uses of sirups and molasses having grown up requires adjustment of the schedule to conform to the purpose for which the products are used. For this reason we advocate tests that will determine the total sugar contents, including sucrose and invert sugars, all of equal value to the users of molasses.

This determination of the total sugars should prove of equal value to the buyer and users as to the sellers of sirups and molasses, in that each may know the true value of the product as scientifically proven. No user of sirups and molasses can otherwise properly determine the value to him, the quantity to use, or the results to be obtained in the usual trade usage of sirups and molasses.

The alcohol maker should know definitely the constituent parts and the total sugars of all kinds contained in the molasses he uses, otherwise he could not determine the value of the raw material used or estimate the cost of his finished product. In practice he does determine this fact before proceeding to manufacture alcohol from molasses.

The feed mixer is required by law in many States to conform to certain guarantees as to chemical analysis to show the unit values of the feed he manufactures. Regardless of statutory requirements, his feeds must conform to natural laws to produce desired results. The principles of the balanced ration have been scientifically worked out and are of proven values. The results to be obtained from the feeds used must be taken into account. As an example, feed for the use of the dairyman for milk production and the feeder of young stock for securing rapid growth and development require a feed high in protein and low in carbohydrates, while that fed for fattening stock must be the reverse—that is, proportionately high in carbohydrates and low in protein—while that for work animals is between the two. The feed value of molasses is contained wholly in its carbohydrate value (all the sugars being carbohydrates).

Any statement that the use of molasses in feed without test or regard for its carbohydrate (total sugars) value at once condemns such feed as unscientific and its use impractical. All feed mixers and feeders well know that the kind or character of materials in feed in no way determines the value of the feed except when due regard is had to the chemical unit value thereof.

Penick & Ford (Ltd.) (Inc.), of New Orleans, have a reprint of series of articles by W. H. Dalrymple, M. R. C. V. S., in which is set forth very fully the value of blackstrap cane molasses for the feeding of horses and mules, dairy and beef cattle, hogs and sheep. Dr. Dalrymple being an accepted authority on the subject of animal feeding and feeds, Penick & Ford, by the reprint and wide distribution of these articles have very properly given indorsement to and approval of the facts contained therein. Quoting from this reprint from Dalrymple by Penick & Ford:

"BLACKSTRAP FEEDING MOLASSES.

"But while blackstrap is a food, it should be understood that it is not a complete food, any more than potash alone constitutes a complete fertilizer. It is almost a pure carbohydrate, and the carbohydrates (sugar and starches) form one of the important ingredients of complete or balanced food. And, besides, it is one of, in some localities, the cheapest sources of this element and with a digestibility of practically 100 per cent.

"As intelligent feeders are aware, all stock foods contain certain elements, or nutrients, in certain percentages, which perform the function of supplying nourishment to the animal body for different purposes, such as the performance of work of different kinds, the production of flesh, of milk, etc. But in order to meet those requirements the nutrients, the chief of which are known as protein, carbohydrates, and fat, have to be properly or approximately balanced, otherwise some parts of the system may be excessively nourished at the expense of other parts, and in such cases the ration is sometimes termed one-sided; while, when the nutrients in digestible form are arranged so as to meet the needs of the animal they are termed a balanced ration. In the use of molasses, therefore, it should be made to take its place as an ingredient of the balanced ration, in supplying a considerable part of the carbohydrate element in concentrated form, just as one would use any other grain or concentrated ingredient, which we will endeavor to illustrate in some sample rations containing blackstrap.

"The amount of molasses to use in a ration will depend upon the character of the other ingredients. If, for example, the roughage part of the ration should be composed of the leguminous hays, which are rich in protein, more molasses may be used than if the roughage should be a grass hay, as the latter is more of the carbohydrate class of feeds to which molasses itself belongs. If a ration should contain too much of either the nitrogenous (protein) or of the carbonaceous (carbohydrate) element, the balance is upset, it becomes one sided, and supplies too much of one element and too little of the other. A balanced ration is approximated to meet the requirements of the animal under different conditions. If this is borne in mind by the feeder, he will readily understand that the mixture, no matter what the ingredients may be, should be so compounded as to meet those requirements in properly balanced form. If molasses should be the cheapest source of carbohydrates, the feeder should substitute as much of it as possible for other and more expensive carbonaceous grains—such as corn, under certain conditions, but not to excess—or that may make the mixture undesirable or one sided.

"For instance, in the case of horse or mule feeding, and where a little cottonseed meal and leguminous hay—such as pea vine, alfalfa, or choice lespedeza—is used, we find that a ration for a working animal weighing 1,000 pounds may be economically balanced by using about the following weights of the different ingredients: Two pounds cottonseed meal, 8 pounds corn chops or corn and cob meal, 6 pounds blackstrap, 12 pounds pea-vine or alfalfa hay.

"By figuring out the digestible nutrients in the above ration, it will be found to approximate the standard requirements for either of the animals mentioned under hard-working conditions.

"If, on the other hand, we use ingredients (feeding materials) which all belong to the same class of feeds, we get a ration that is altogether unbalanced, or one-sided. For example, if we try to make our ration out of molasses, corn, and timothy hay (a grass hay), we are using carbonaceous feeds all through, with the result that we get too much carbohydrates, which produce heat and energy chiefly, with too little protein, which goes to make muscle, etc.

"Again, if we use all protein feeds we err in the opposite direction. An illustration of this would be the use of cottonseed meal, oats, and alfalfa hay, all relatively rich in protein. In the former instance, we get too much carbohydrates (starches and sugar), with too little protein, for the needs of the animal; and in the latter an excess of protein, with a deficiency of carbohydrates. In either case we have destroyed the proper balance of the required nutrients and have supplied too much of the one or the other for the needs of our animal and for best results.

"Molasses, however, has a most valuable place in any ration for horses and mules on account of its high carbohydrates content, its high digestibility, and, ordinarily, its cheapness. But the amount will have to be regulated by the amount of the digestible nutrients contained in the other ingredients of the mixture. The weight of blackstrap is usually estimated at about 12 pounds to the gallon."

These fundamental facts are well known, and for successful feeding must be adhered to by the feeder if desired results are to be obtained. Therefore, not only economic necessity, but for parctical results, must the feed mixer and the feeder know the carbohydrate value of the molasses he uses, just as he must know the protein value of the other ingredients used in his feed. He can not assert that he simply dumps in such and such per cent or so many pounds of each ingredient in his feed without at once making the confession of utter disregard for the results to be obtained from feed so mixed. He must know, and does know, the carbohydrate (total sugar) value of the molasses he uses. His feed to be properly balanced must contain the proper ration of essential units. If he buys molasses testing high in total sugars (carbohydrates), he very properly reduces the volume of molasses in the feed; if low in total sugars, then the volume is increased. This, and this only, explains the variation of the percentage by volume of molasses used in mixed feeds, where the percentage of molasses varies in feeds for the several uses to which they are put. May not this explain the desire on the part of the importer for the high minimum test asked for? Blackstrap molasses produced in America is higher in total sugar content than that imported. By fixing a high minimum total sugar, or polariscopic test, all imported molasses comes in at the same level base rate. The domestic article is without the benefit of the true test value, and the producer must sell his superior product on the price level so fixed. The feed buyer is led to believe that "blackstrap is blackstrap," while the importer and feed mixer benefits by the very tests he now opposes in the tariff bill.

No argument is needed to show that the importer does carefully test molasses. Long exhibits of tests made covering periods of years are before you in the testimony

presented by the opponents. These tests, many of them, are quoted for periods several years before there was called to your attention the inequality of the existing tests and rates. Therefore, any claim on the part of the importer that to him "blackstrap is blackstrap," without regard to its total sugar value, is disproved by his own testimony. He did test for total sugars; he can test for total sugars; he does test for total sugars. The value of blackstrap molasses is its total sugar content and no other; therefore, the duty should be based on the true value, viz, the total sugars content.

Therefore, no feed mixer can operate nor feeder use molasses intelligently or profitably in his feeds without knowledge of the total sugars (carbohydrate) value. The total sugars (carbohydrate) content being the economic value of molasses, then molasses should pay duty on this basis.

In 1918 Herbert Hoover, then Food Administrator, appointed the committee on cane sirup and molasses. The personnel of this committee were: R. E. Milling, chairman, New Orleans, La.; N. W. Taussig, secretary, New York, N. Y.; G. R. Bunker, New York, N. Y.; C. D. Kemper, New Orleans, La.; W. L. Petrikin, Denver, Colo.

In the report made by this committee we find a true analysis of the various grades of sirups and molasses. From their report we quote:

"There are several grades of molasses and sirups, viz: (*a*) Cane-juice sirup. (*b*) Old-fashioned open-kettle molasses. (*c*) Centrifugal molasses, which may be divided into, first, centrifugal molasses derived from the open-kettle process; second, centrifugal molasses derived from the vacuum process; whether derived from either process, however, they are divided into first, second, and third molasses. (*d*) Refiners' sirups, which are subdivided into, first, the highest quality of filtered sirup; second, medium; third, unfiltered, fourth, blackstrap. (*e*) Commercial glucose, commonly known as corn sirup.

"Cane-juice sirup contains approximately 71 per cent of combined sugars, of which 55 per cent is sucrose and 16 per cent invert. A gallon of sirup weighing approximately 12 pounds we find that if based upon the above percentages contains 6.6 pounds sucrose, 1.92 pounds invert, or 8.52 pounds total sugars.

"First molasses contains 65 per cent combined sugars, 48 per cent of which is sucrose and 17 per cent invert, so we have 5.76 pounds sucrose, 2.04 pounds invert, or 7.80 pounds total sugars.

"Second molasses contains about 60 per cent combined sugars, 31 per cent sucrose, and 29 per cent invert, so we have 3.72 pounds of sucrose, 3.48 pounds of invert, or 7.20 pounds total sugars.

"Third molasses contains 50 per cent combined sugars, 30 per cent sucrose, 20 per cent invert, so we have 3.6 pounds of sucrose, 2.4 pounds of invert, or 6 pounds total sugars.

"Refiners sirup, highest grade, has 63 per cent combined sugars, 35 per cent surcose, and 28 per cent invert, so we have 4.2 pounds sucrose, 3.36 pounds invert, or 7.56 pounds total sugars.

"Trade and custom have declared that standard blackstrap must have a combined test of sucrose and invert of not less than 50 per cent and must be at least 42 Baumé at a temperature of 90° F. Final molasses meeting this test, or slightly above or below the same, would be considered blackstrap, whereas final molasses which is above standard blackstrap, say, 55 per cent combined sugars, while frequently sold as blackstrap, is of superior quality and should be classed as Louisiana third molasses."

Therefore, any test method that does not show the total sugar content of the molasses or sirup fails totally in arriving at their true food or economic value. Even though the regulations be changed to this proper method, the result would be equally abortive and of no value if the minimum scale for total sugars be placed at a point above the total sugar test of any of the various grades.

The regulations previously in effect have no meaning because of high point polariscopic test of 40 degrees, for the reason that as shown in the report quoted only the two very highest grades of sirups contain as much as 40 degrees sucrose (the only factor shown by the polariscope), and since there is but little importation of such high-grade sirups the result is that nearly all sirups now imported come in at the same rate, there being no discoverable difference by the polariscope.

By placing the minimum test and the base rate at 48 per cent total sugars, then, in that event, all sirups and molasses imported would come in on their true test and at fair proportionate rates. Any higher minimum would be wholly meaningless and simply result in all importations coming in at a flat tariff rate regardless of quality or value.

RATES IN FORDNEY BILL.

The rate in the bill now before you reads twenty-five one-hundredths of 1 cent per gallon for molasses testing not above 48 per cent total sugars with two hundred and seventy-five one-thousandths of 1 cent for each per cent of total sugars over and above 48 per cent.

This would mean for the blackstrap molasses testing 50 per cent, eight-tenths of 1 per cent per gallon general tariff, sixty-four one-hundredths of 1 cent from Cuba.

Duty per gallon on molasses testing 48° and above total sugars.

Testing not above—	In general.	From Cuba.	Testing not above—	In general.	From Cuba.	Testing not above—	In general.	From Cuba.
°	Cents.	Cents.	°	Cents.	Cents.	°	Cents.	Cents.
48	0.25	0.20	56	2.45	1.96	64	4.65	[illegible]
49	.52	.42	57	2.72	2.18	65	4.92	[illegible]
50	.80	.64	58	3.00	2.40	66	5.20	[illegible]
51	1.07	.86	59	3.27	2.62	67	5.47	[illegible]
52	1.35	1.08	60	3.55	2.84	68	5.75	[illegible]
53	1.62	1.30	61	3.82	3.06	69	6.02	[illegible]
54	1.90	1.52	62	4.10	3.28	70	6.30	[illegible]
55	2.17	1.74	63	4.37	3.50	71	6.57	[illegible]

There should be a rate of not less than 1 cent per gallon, 48 per cent test total sugars with two hundred and seventy-five one-thousandths for each additional degree. This would make the rate on molasses testing 50 per cent general tariff, 1.55; Cuban tariff, 1.24.

MOLASSES USED FOR OTHER PURPOSES THAN FEED MIXING.

During the war period large quantities of industrial alcohol were produced from molasses. This increased production of alcohol over the prewar period was caused by the demand of America and the Allies for alcohol for the manufacture of explosives and other war uses. Reports from internal revenue reports show that 90 per cent of all low-grade molasses imported during that period was converted into alcohol. From available data—such sources as internal revenue reports, Department of Commerce, Federal Trade Commission, and trade papers—it is clearly shown that the proportion of molasses used in the manufacture of alcohol and mixed feeds, for the latest dates, calendar year 1920 and fiscal year ending June 30, 1921, is molasses used for alcohol making, 60 per cent; feed mixing, 40 per cent. On this basis there were used from the 1920 (fiscal year) imports, which totaled 160,123,653 gallons, 60 per cent for alcohol making, or 96,074,191.8 gallons; 40 per cent for feed mixing, or 64,049,461.2 gallons; a total of 160,123,653 gallons.

The feed mixers claim to produce 3,000,000 tons of molasses feed annually. The average molasses content of mixed feed being about 20 per cent, makes the estimate of 60 per cent of imports for alcohol and 40 per cent for feed mixing in agreement with the feed-mixer's statement as to his production of 3,000,000 tons and the 20 per cent average molasses content of mixed feed.

You have before you exhaustive data in tabulated form in the brief submitted by Gray Silver. Having had the privilege of studying the official data contained therein previous to its filing, and out of deference to the committee, I would respectfully refer same to you as correct, this reference and application confined solely to the tabulated data.

Please note that molasses from our insular possessions, Porto Rico and Hawaii, should be treated as domestic production and not imports.

Referring again to alcohol production, it is significant that this industry, although far the largest users of molasses in manufacture, has voiced no protest either against the tests for total sugars or the rates asked for. The producers of industrial alcohol use no other mixture in making their product, and since for each gallon of molasses (dependent on its total sugar content) produce from six-tenths to eighty-five one-hundredths gallon of alcohol, molasses being 60 to 85 per cent of their finished product, whereas in feed mixing the proportion is 20 per cent. The larger users of molasses both in volume and in proportion to finished product apparently are not protesting

MOLASSES MIXING.

It is significant that the leading opponents of the proposed new schedule on sirups and molasses—and allow me to say right here that the schedule is not restricted to blackstrap but covers all grades of molasses; in fact, the word "blackstrap" is not mentioned in the act—are not feed mixers but mixers of sirup for human consumption. It is a well-known fact that they take the by-products of the starch factories, corn sirups, etc., and flavor them with cane molasses, which comes in direct competition with all of the pure cane and sorghum sirups grown in America.

This is of vital importance to the cane-growing industry of Louisiana, but I am frank to say that I believe it is of more importance to the sirup producers outside of the State of Louisiana.

The production of sirup in America for direct consumption is very material, as evidenced by the following report from the Yearbook of Department of Agriculture for 1920:

Area of sugar cane and production of cane sirup in the United States, 1919 and 1920 (not including sorghum).

State.	Total cane area.		Area harvested for sirup.		Sirup made.

1918	374,800	79.1	29,643,000	96.3	28,532,000
1917	415,200	90.3	37,472,000	69.5	26,055,000

All sirup brought in that can be used directly for human consumption or for the flavoring of mixed sirups comes in direct competition with both the cane and sorghum sirup produced.

COMPETITION WITH DOMESTIC PRODUCTION.

The contention that "blackstrap is blackstrap" is not only incorrect, but sinister in its purpose and effect on domestic sirups and molasses. Every grade of the domestic product is admittedly superior to that imported. In Louisiana the term "blackstrap" is often, by the buyers, made to cover even second and third molasses. If imported low-grade molasses is allowed to enter on a polariscopic test or total sugar test of a minimum above 48 per cent, then this high-grade domestic product will continue to meet the low-quality imported molasses on the "blackstrap is blackstrap" level. Because of this very condition to-day buyers are offering only 2 cents per gallon to the producer for the domestic molasses, when even on the present depressed market this domestic molasses has an intrinsic value basis total sugars of 4 cents to 6 cents per gallon. Yet, under the regulations and tariff by them proposed, the buyers in effect say, "Blackstrap is blackstrap. We offer 2 cents per gallon. Take it or turn your molasses into the bayou."

There is no other product in America to-day so closely confined in its primary market as sirups and molasses, this with particular reference to the lower grades. The entire market is confined to three buyers, and in Louisiana it is even more restricted.

We do not ask a duty that will add materially to the cost of mixed feed, alcohol, or table sirup, but we know that at 5 to 6 cents per gallon to the producer of domestic low-grade molasses and a proportionate price for the high-grade sirups there still is ample profits to users and converters of these sirups and a return to the producer that will enable him to provide containers for, rather than dump into the stream, his product.

A duty on "sirups and molasses of 1 cent per gallon for molasses testing not above 48 per cent total sugar with two hundred and seventy-five one-thousandths of 1 cent for each additional degree of total sugars" will enable the domestic producer to sell his product based on its intrinsic value and at a price of 5 to 6 cents per gallon for blackstrap. We think you will see the fairness of this and hope you will grant our request.

STATEMENT OF DWIGHT E. HAMLIN, REPRESENTING DWIGHT HAMLIN CO., PITTSBURGH, PA.

Mr. HAMLIN. I will just file a brief. The subject has been covered so well that there is no necessity for me taking up any more of your time, and I will do that.

The CHAIRMAN. You speak in conjunction with those who want either no duty or a small duty on blackstrap molasses?

Mr. HAMLIN. Yes, sir; we want no duty. I am a feed manufacturer and operate a farm in Pennsylvania.

The CHAIRMAN. I know you do.

(The brief is as follows:)

Our troubles are exceptionally serious to us. In fact, a tariff of one-fourth cent per gallon on 48 per cent total sugars and an additional twenty-seven and one-half hundredths of 1 cent for each additional 1 per cent sugars on blackstrap molasses will put the feed industry out of business. If the feed industry is put out of business, it will work a great hardship on thousands of dairymen, fat-cattle feeders, and truckmen and indirectly increase prices of all meats and dairy products.

The situation is just this: The bill as it now stands reads one-fourth cent per gallon duty on blackstrap molasses based on 48 per cent total sugars. Now, there is practically no blackstrap molasses that tests as low as 48 per cent total sugars, and in the extremely rare instances where it tests as low as that the molasses is regarded as adulterated. The average of imported blackstrap molasses would be about 54 per cent total sugars. Now, with the basic rate of one-fourth cent and an additional one-fourth cent, or, to be exact, two hundred and seventy-five one-thousandths of a cent for each 1 per cent additional total sugars above 48, you can see that the average blackstrap molasses will be assessed an extra 1½ cents per gallon, or a total, with the basic one-fourth cent, of more than 1¾ cents per gallon, and some of the higher-testing blackstrap, which may run as high as 60 per cent total sugars, would have to pay a

duty as high as 3¼ cents per gallon. What we want to do is to get the basis changed so that all blackstrap molasses can come in at the basic rate of not to exceed one-fourth cent per gallon. All previous tariffs have permitted all blackstrap molasses to come in at the basic rate, and this proposition of basing the duty on total sugar content is an entirely new proposition, and it certainly will not work in the case of blackstrap molasses, because who could afford to import blackstrap molasses without knowing whether the duty was going to amount to one-fourth cent per gallon or 3¼ cents per gallon?

There would be no way of keeping the molasses separate and no way of telling what it was going to analyze until it reached this country.

STATEMENT OF A. F. SEAY, ST. LOUIS, MO., REPRESENTING ST. LOUIS (MO.) AND EAST ST. LOUIS (ILL.) FEED MANUFACTURERS.

Mr. SEAY. I represent the St. Louis and the East St. Louis millers, and also the Ralston Purina Co., who have mills located in St. Louis and East St. Louis, Nashville, Buffalo, and Fort Worth, Tex.

I am not going to take up your time to tell you the situation that faces not only the millers but ourselves as manufacturers, but with your permission we should be pleased to make a brief statement.

I represent St. Louis (Mo.) and an East St. Louis (Ill.) molasses-feed mill interest, eight in number, also the Ralston Purina Co. of St. Louis, Mo., one of the largest manufacturers of molasses feed in the country, having mills located at St. Louis, Mo., East St. Louis, Ill., Buffalo, N. Y., Nashville, Tenn., and Fort Worth, Tex.

In our own company alone we employ some 200 traveling representatives and give employment to hundreds of others in our mills and offices. When all of the molasses-feed manufacturers are considered as a whole their total business runs into a tremendous volume, as shown by the brief filed by the American Feed Manufacturers' Association. This is an industry worth protecting, because it renders an economical service to the country at large.

Through the combining of certain feed materials and blackstrap molasses together, which is fed in conjunction with all home-grown grains, we enable the farmer to produce meat and dairy products in a shorter period of time and at a lower cost per pound; at the same time allow him to get more out of his home-grown grains than would be the case if he fed them without the molasses-feed mixture. So the molasses-feed business is not to replace home-grown grains but supplement them.

Blackstrap molasses is the basic raw material for this industry. Our country doesn't begin to produce this commodity in sufficient quantities to operate our present industries. Records filed with your committee show that in the United States we produce only about 8 per cent of the total blackstrap molasses used. We believe that it is the purpose of the committee to protect home industries, who depend on foreign materials with which to operate their plants, and permit them to secure such basic products at the lowest possible cost.

We object to the present basis of the Fordney tariff bill, which calls for a maximum of 48 per cent total sugars and a penalty for every 1 per cent over this amount. Blackstrap molasses imported into this country, as shown by statements already filed with you, varies considerably in the total sugar content, most of the cargoes running from around 50 per cent to over 60 per cent total sugars, and yet in

the manufacture of molasses feed we can not possibly get any more for that testing 60 per cent total sugars than that testing 50 per cent.

The nature of the business is such that blackstrap molasses is obtained from different shippers at the same time and stored together in large storage tanks. It would be impossible to market the same brand of feed and say to the dealers and consumers that this shipment has blackstrap molasses containing 6 per cent more sugar in it and we will have to charge you so much more than we did the last time. All sales are made at a definite price before the feeds are shipped. All blackstrap molasses, regardless of total sugar content has the same commercial value.

A further study of the Fordney tariff bill shows that even though there are several grades of the different grains listed therein and the markets in this country pay a different price for the several grades yet this bill permits their importation on a flat rate as follows:

Paragraph 723: Barley, hulled or unhulled, 15 cents per bushel.
Paragraph 724: Buckwheat, hulled or unhulled, 30 cents per hundred pounds.
Paragraph 725: Corn or maize, 15 cents per bushel.
Paragraph 727: Oats, hulled or unhulled, 10 cents per bushel.
Paragraph 729: Rye, 10 cents per bushel.
Paragraph 730: Wheat, 25 cents per bushel.

We believe that it is the desire of your committee to permit the importation of molasses and sirups which can not be used for table purposes or from which there can not be made a further extraction of sugar without penalizing the feed manufacturers, and further that such molasses can not be used for any other purpose than for feeding.

Upon investigation we find that where the total sucrose content of molasses doesn't exceed 40 per cent it would be unfit for table use or the further extraction of sugar. We therefore hope that you will see your way clear to segregate blackstrap molasses in a somewhat different way than you would molasses or sirups for table use or further extraction of sugar and consider same separately in the tariff on the basis of free entry or not over one-fourth cent per gallon duty.

CANDY AND CONFECTIONERY.

[Paragraph 506.]

STATEMENT OF WALTER C. HUGHES, REPRESENTING NATIONAL CONFECTIONERS' ASSOCIATION.

Mr. HUGHES. According to the 1919 census, there are about 3,15[illegible] manufacturers in our association, representing an investment of about $315,000,000. In addition, we have 3,500 candy jobbers and about 75,000 candy retailers, and these do not include the wholesale grocers and wholesale druggists who are large distributors of candy. We have no record of the entire number.

The total sales of the manufacturers for the year 1919 amounted to about $450,000,000. The total number of employees engaged in the industry, which does not include superintendents or salaried officials, was 76,000, and the total number of employees, which includes everybody employed in the industry, is about 250,000.

There is a direct relation between the duty on sugar and the duty on candy. The duty as proposed in the pending tariff bill is 30 per cent ad valorem.

Senator WATSON. To what are you addressing yourself now?

Mr. HUGHES. This is paragraph 506. I should have stated that when I began.

We recommend that the duty should be made 50 per cent ad valorem for these reasons.

Senator WATSON. What is it in the Fordney bill?

Mr. HUGHES. Thirty per cent ad valorem in the Fordney bill. We recommend that it should be made 50 per cent ad valorem.

Sugar of 96° test, in the Payne-Aldrich bill, was 1.68 cents; refined, 1.95 cents. At that time the duty on candy was 4 cents per pound, and 15 per cent ad valorem on candy under 15 cents per pound, and on candy over 15 cents per pound it was 50 per cent ad valorem. Under the Underwood bill the duty on 96° test sugar was 1.25 cents per pound; on refined sugar, 1.36 cents per pound; and the duty on candy was 2 cents per pound under 15 cents per pound, and 25 per cent ad valorem over 15 cents per pound.

The duty in the Fordney tariff bill on 96° test sugar is 2 cents per pound; on refined sugar, 2.16 cents per pound with, as I said a moment ago, a duty on candy of 30 per cent ad valorem.

The duty on 96° test sugar has been increased 60 per cent as compared with the duty that was in effect prior to the passage of the emergency tariff bill. Now, we must take also this fact into consideration, that the Underwood bill admitted sugar on the free list, on May 1, 1916, but that was repealed by Congress on April 27, 1916. Therefore, with free sugar contemplated the duty on candy valued at 15 cents per pound or less was 2 cents per pound, and valued at more than 15 cents per pound 25 per cent ad valorem. On this same basis, if the duty is to remain 2 cents per pound on 96° test sugar and 2.16 cents per pound on refined sugar, then the duty on candy should be 50 per cent ad valorem.

Senator WATSON. Have you worked out that relationship to your own satisfaction?

Mr. HUGHES. We have; yes, sir.

With reference to the duty on other raw materials in which we are interested, just to show the effect they have upon our costs, let me cite these illustrations.

Almonds, not shelled, present duty 3 cents; proposed duty 5 cents. Almonds, shelled, present duty 4 cents; proposed duty, 15 cents.

Walnuts, not shelled, 2 cents; proposed duty, 4 cents. Walnuts, shelled, 4 cents; proposed duty, 15 cents.

Egg albumen, another item which must be taken into consideration, present duty, 3 cents; proposed duty, 15 cents.

There are approximately 165 different kinds of raw materials which the manufacturers use on which duties have been increased anywhere from 10 per cent to 400 per cent, which, therefore, adds that much to their cost of production; and these raw materials include such supplies as essential oils, flavoring extracts, colors, and materials of that kind that increase the cost of the finished product. Therefore we are vitally interested with reference to these proposed increases in the duties on the various supplies that I have mentioned.

Then there is another thing which we must take into consideration and that is the question of foreign competition.

There are many large manufacturers in Germany, England, France, and Canada; and prior to the Great War they produced candy in very large quantities. The economic conditions in these countries are such at the present time that they are going to seek foreign markets for their output. They must keep their plants running, and, therefore, we can expect in the near future that, unless there is an import duty which will protect us against this foreign competition, we are going to have very serious foreign competition. The competition that we are going to have from the countries that I have mentioned is going to be on low-priced candies. It is very likely that approximately 80 per cent of the manufacturers in this country will come into competition with candies brought in from foreign countries. We recently made a survey of the industry, and we know that 80 per cent of the output of the entire industry is sold by manufacturers at under 20 cents a pound, and it is this grade of candy on which we expect the competition from foreign countries; that is, on the low-priced candy.

Senator WALSH. I do not think the imported candies are nearly so good as the American-made candies, even the poorer grades.

Mr. HUGHES. I am very glad to hear you say that, Senator Walsh. The imported candies were largely from England, France, and Austria. They were of special varieties which they made over there, but they are very likely more interested in selling the lower-priced candies rather than the candies of higher grade.

We must also take into consideration the question of the low cost of production in these foreign countries. As an illustration, over there the wages and cost of materials, and on account of the drawback allowed on exports, enable them to place these candies on the market at lower prices than they can be made for in the United States. As illustrative of this point, I am going to furnish you with some figures of wages paid to male and female workers in candy factories in those countries from which we will have the keenest competition.

Senator WATSON. You do not mean a common level of wages?

Mr. HUGHES. I was just about to read them for the different countries.

Senator WATSON. Very well.

Mr. HUGHES. Germany, 4 cents to 11 cents per hour; France, 4 cents to 13.5 cents per hour; England, 14 cents to 26 cents per hour. The wages paid to the same classes of female and male workers in the United States range from 25 cents to $1 per hour.

Senator WATSON. Did you interpret that in wages paid in American money?

Mr. HUGHES. Yes. This report from which I am reading was made for the benefit of the Ways and Means Committee of the House.

Now, with reference to the Japanese competition. I want to say a word about that, and then I shall be through. We are reliably informed that the Japanese have been over here for the purpose of seeing whether there is an opportunity to sell their candies in this country. We know that so far as the Japanese are concerned they have large factories over there in Japan—in Tokyo, Yokohama, and Kobe—and they are equipped, as I know personally, with modern machinery, a great deal of which was manufactured here in the United States. They are thoroughly up to date in their factories. The low cost of production is due to the extremely low wages which they pay employees, and also the low cost of raw materials.

The wages paid the male employees in candy factories average $1 per day, or $20 a month with board, as compared with $4 to $10 per day for male workers here in the United States.

One of the largest Japanese firms is located at Tokyo. That firm employs 2,000 laborers in its plant, and its plant is equipped in every way with modern, up-to-date machinery, and of course can compete with American manufacturers.

Therefore we are in this position, that we must have a higher duty on candy in order to meet this foreign competition. We recommend, therefore, as I said a moment ago, that the duty should be made 50 per cent ad valorem instead of 30 per cent ad valorem, as it is in the pending tariff bill.

Senator McLEAN. You have the recent importations?

Mr. HUGHES. No, sir. I would be glad, however, to furnish you with those figures, Senator McLean, or include them in the brief which I would like to have the privilege of filing, if I may.

Senator McLEAN. Are they increasing rapidly at the present time?

Mr. HUGHES. I could not say as to that, because I would not be in a position to answer that question accurately, but we anticipate that we shall meet very serious competition in that direction.

Senator WALSH. The imports for the 10 months of this year were 539,270 pounds, or about a half million pounds, and the production of the candy in America, in 1914, was 154,000,000 pounds.

Mr. HUGHES. It is the future that we are looking to rather than the immediate present.

Senator McLEAN. What percentage of the cost is labor cost?

Mr. HUGHES. That depends entirely upon the circumstances. It depends upon the class of candy; that is, whether it happens to be hand made or whether it is machine made. I can not answer that question without knowing the particular candy which you have in mind.

Senator McLEAN. Take the cheaper grades sold, for instance, at around 20 cents per pound. That would represent a large proportion, would it not?

Mr. HUGHES. Yes; 80 per cent.

Senator McLEAN. About what percentage would the labor be?

Mr. HUGHES. I would not want to say because I would not be able to give that information accurately.

Senator SIMMONS. Do you export any candy?

Mr. HUGHES. Prior to the war the exports were what you might call satisfactory. During the war they increased to a considerable extent due to the conditions with which you are of course familiar. Since the war exports have fallen off rapidly. At the present time, while I have not the figures before me, I know that they are very much less than a year ago.

Senator SIMMONS. The export trade before the war was somewhere near $2,000,000, was it not?

Mr. HUGHES. I should say just offhand, Senator—I would not quote this as a correct figure—that it would run probably less than that amount.

Senator SIMMONS. This document here shows that the exports for 1914 were valued at $1,329,000; in 1918, $1,856,000, an increase of about a half million dollars during the war. But even then the exports—I am referring now to what they were before the war,

$1,300,000—would be two or three times the imports. The value of the imports for the year 1921, or for the 10 months of 1921, were only $157,000.

Mr. HUGHES. What year?

Senator SIMMONS. 1921. For the 10 months of 1921 they were only $157,000. It would seem to me that you had not much cause to complain of that in view of the fact that the domestic production before the war was about 154,000,000 pounds.

Mr. HUGHES. I might say in answer to that question——

Senator SIMMONS (interposing). Certainly there is nothing in the present condition or in past conditions that would justify the apprehension you have expressed, and I do not think you have given the committee any special reason, or any particular reason for supposing that the future would be worse than the past.

Mr. HUGHES. We can say this with what you might call a reasonable degree of assurance, that we are going to have more intensive competition from these foreign countries. I mean that we are going to have it from this time on, perhaps not in the next month or the next six months, but during the course of a few years. The competition is going to be more intense than it was before the war.

Senator SIMMONS. It did not run in the line of candy before the war or during the war, so why do you suppose the competition from over there will hereafter run strongly in the line of candy?

Mr. HUGHES. For this reason, that these factories over there are going to keep going. They are going to find markets for their products in foreign countries, including the United States, and for that reason we expect that they are going to get into this market stronger than ever before.

Senator SIMMONS. Suppose they were to go into the market many times stronger, still our imports would not be equal to the exports.

Mr. HUGHES. They will have the advantage, however.

Senator SIMMONS. I do not know about that—not any more so.

Mr. HUGHES. There are lower production costs and wages.

Senator SIMMONS. But they had that advantage before the war, or at least the gentlemen who came before the committee before the war told us that.

Mr. HUGHES. But not to quite as great an extent, Senator Simmons, as they have at present. Conditions over there, as you know, are very serious now. They are much more serious than before.

Senator WALSH. You are troubled more about the ingredients than with the imports of the candy itself, are you not?

Mr. HUGHES. Yes.

There is no objection to the ad valorem duty of 50 per cent that we are advocating. It gives the Government that much more revenue by 20 per cent on anything that comes in.

BRIEF OF WALTER C. HUGHES, REPRESENTING THE NATIONAL CONFECTIONERS' ASSOCIATION.

SIZE OF INDUSTRY.

The confectionery industry is one of the largest industries in the United States. There are approximately 3,150 manufacturers, with an investment of about $315,000,000, who sell the wholesale and retail trade, consisting of approximately 3,500 candy jobbers and 75,000 candy retailers.

This, however, does not include several thousand wholesale and retail grocers and wholesale and retail druggists, through whom a large volume of candy is distributed.

We have no means of knowing the value of the investment of the wholesalers and retailers, but it is obviously very great.

The total value of the output of the manufacturers for the year 1919 was approximately $450,000,000.

The total number of employees engaged in the manufacture of candy, which does not include salaried officials, managers, office employees or salesmen, or the employees of the jobbers and retailers, is approximately 76,000.

The total number of employees engaged in the industry is approximately 250,000.

DUTY ON CANDY AS COMPARED WITH THE DUTY ON SUGAR.

The proposed duty will not give adequate protection to our industry, and we respectfully request that the duty on candy and all confectionery be made 50 per cent ad valorem.

There is a direct relation between the duty on sugar and the duty on candy and confectionery.

The duty on sugar as provided in recent tariff bills is as follows:

	Sugar.		Candy.	
	96° test.	Refined.	Under 15 cents per pound.	Over 15 cents per pound.
	Cents.	*Cents.*		
Payne	1.68	1.95	4 cents per pound and 15 per cent ad valorem.	50 per cent ad valorem.
Underwood	1.25	1.36	2 cents per pound	25 per cent ad valorem.
Fordney	2.00	2.16	30 per cent ad valorem	30 per cent ad valorem.

The duty on raw sugar 96° test in the pending tariff bill as compared with the present duty as provided in the Underwood bill is increased approximately 60 per cent.

Furthermore, the Underwood bill provided that sugar should be placed on the free list on May 1, 1916, but this provision was repealed by Congress on April 27, 1916.

Therefore, with free sugar contemplated, the duty as provided in the Underwood bill on candy and all confectionery valued at 15 cents per pound or less is 2 cents per pound, and valued at more than 15 cents per pound, 25 per cent ad valorem.

On the same basis, with the duty on raw sugar 96° test 2 cents per pound as proposed in the pending tariff bill, the duty on candy and all confectionery should be at least double the present duty which would be practically the same as the duty in the Payne-Aldrich bill and we are therefore asking for a uniform duty of 50 per cent ad valorem.

DUTY INCREASED ON OTHER BASIC RAW MATERIALS.

The present and proposed duties on various other raw materials, which are used in large quantities by manufacturing confectioners, are as follows:

	Present duties.	Proposed duties.
Almonds:	*Cents.*	*Cents.*
Not shelled	3	5
Shelled	4	15
Walnuts:		
Not shelled	2	4
Shelled	4	15
Egg albumen	3	15

The duties on 165 kinds of materials used by manufacturing confectioners have been increased from 10 per cent to 400 per cent, such as the increased duties on essential oils, flavoring extracts, and colors, which further increase our cost of production and make it still more difficult for us to compete with foreign manufacturers and which is surely going to be a serious factor in the development of our industry.

We are therefore vitally interested in the proposed duties on various raw materials and especially in the proposed duties on shelled nuts, which we consider are unreasonably high.

Furthermore, our industry is burdened with taxation to such an extent as to further increase our cost of production and make it possible for foreign competition to enter this market.

FOREIGN COMPETITION A SERIOUS FACTOR.

There are many large candy factories in Germany, England, France, and Canada which, prior to the great war, shipped candy into this country in large quantities. Smaller quantities were shipped from various other countries.

The economic conditions in these countries will force the owners of these large candy factories to sell their surplus production in foreign markets, and the United States will be an inviting field.

Taking into consideration these conditions, it is evident that in the very near future we must contend with intensive foreign competition unless we are given adequate protection by a higher duty than that provided in the pending tariff bill.

FOREIGN COMPETITION ON LOW-PRICED CANDIES.

Foreign competition will be on low and medium priced candies. Such candies are sold by manufacturers in the United States at prices averaging 20 cents per pound and less.

The cost of production has not decreased to such an extent as to enable United States manufacturers to make any further reduction in their prices and at the same time make a decent-living profit. Manufacturers have reduced their prices on an average approximately 50 per cent.

The slight decreases in the prices of some few basic raw materials are more than offset by the proposed increase in the duty on sugar and various raw materials and the increase in labor and overhead expenses, the latter, as compared with 1920, showing an average increase of about 40 per cent.

The low and medium priced candies are staple lines on which there is the keenest local competition. They are sold at a very narrow margin of profit and constitute approximately 80 per cent of the entire output of all kinds of candy.

Therefore 80 per cent of the entire output of the industry would be seriously menaced by low-priced foreign candies.

LOW COST OF PRODUCTION IN FOREIGN COUNTRIES.

Candy manufacturers in England, Germany, France, and Canada can produce the same grades of candy at a much lower cost of production than United States manufacturers, largely due to lower duties on various raw materials and drawbacks allowed on exports by these countries.

Wages and the cost of sugar and other materials are very much lower.

Wages paid to male and female workers in candy factories in those countries from which we will have the keenest competition are as follows: Germany, 4 cents to 1[illegible] cents per hour; France, 4 cents to 13½ cents per hour; England, 14 cents to 26 cents per hour.

Wages paid the same classes of male and female workers in candy factories in the United States average from 25 cents to $1 per hour.

JAPANESE COMPETITION.

We are reliably informed that Japanese candy manufacturers are making extensive investigations relative to the opportunities for the sale of their products in the United States.

Should they invade this market, as they very likely will do, it will be a very serious matter for our industry.

The low cost of production, due to extremely low wages and low cost of raw materials and packages, would enable them to flood this market with low-priced candies and would make them very formidable competitors.

Wages paid male workers in candy factories in Japan average about $1 per day, or $20 per month with board, as compared with $4 to $10 per day paid to male candy workers in the factories in the United States.

The candy factories in Tokyo, Yokohama, and Kobe, we are reliably informed, are equipped with the most modern, up-to-date candy machinery, a great deal of which was manufactured in the United States.

The quality of the candy manufactured in these plants and the method of packing compares very favorably with similar kinds of candy manufactured in the United States and England.

The Morinaga Confectionery Co. (Ltd.), of Tokyo, employs 2,000 male and female workers and is one of the largest concerns of its kind in either Europe and Asia.

OVEREXPANSION OF INDUSTRY IN THE UNITED STATES.

The confectionery industry in the United States has always been highly competitive, and, furthermore, due to overexpansion during the war period there is now serious overproduction and keener competitive conditions than ever before and a further invasion by low-priced foreign competition would be disastrous.

HIGHER DUTY ABSOLUTELY NECESSARY.

We are, therefore, appealing to you for adequate protection through a higher duty.

There is no opposition to a higher duty, and it would give our industry the protection which we must have against ruinous foreign competition.

We trust, therefore, that our request for a duty on candy and all confectionery of 50 per cent ad valorem will receive your favorable consideration.

81527—22—SCH 5——17

INDEX TO SCHEDULE 5.

NAMES.

SUBJECTS.

HEARINGS

BEFORE THE

COMMITTEE ON FINANCE

UNITED STATES SENATE

ON THE PROPOSED

TARIFF ACT OF 1921

(H. R. 7456)

SCHEDULE 6

TOBACCO AND MANUFACTURES OF

Revised and Indexed

WASHINGTON
GOVERNMENT PRINTING OFFICE
1922

COMMITTEE ON FINANCE.

BOIES PENROSE, Pennsylvania, *Chairman.*

PORTER J. McCUMBER, North Dakota.
REED SMOOT, Utah.
ROBERT M. LA FOLLETTE, Wisconsin.
WILLIAM P. DILLINGHAM, Vermont.
GEORGE P. McLEAN, Connecticut.
CHARLES CURTIS, Kansas.
JAMES E. WATSON, Indiana.
WILLIAM M. CALDER, New York.
HOWARD SUTHERLAND, West Virginia.

FURNIFOLD M. SIMMONS, North Carolina.
JOHN SHARP WILLIAMS, Mississippi.
ANDRIEUS A. JONES, New Mexico.
PETER G. GERRY, Rhode Island.
JAMES A. REED, Missouri.
DAVID I. WALSH, Massachusetts.

LEIGHTON C. TAYLOR, *Clerk.*
W. B. STEWART, *Assistant Clerk.*

NOTE.

Believing the greatest demand for the Tariff Hearings before the Senate Finance Committee on H. R. 7456 will be only for those schedules containing the particular items in which each individual is interested, the preliminary prints have been revised and indexed and printed by schedules.

The hearings are paged consecutively and comprise the following separate documents:

American Valuation.
Dyes Embargo.
Schedule 1.—Chemicals, Oils, and Paints.
Schedu'e 2.—Earths, Earthenware, and Glassware.
Schedule 3.—Metals and Manufactures of.
Schedule 4.—Wood and Manufactures of.
Schedule 5.—Sugar, Molasses, and Manufactures of.
Schedule 6.—Tobacco and Manufactures of.
Schedule 7.—Agricultural Products and Provisions } combined.
Schedule 8.—Spirits, Wines, and Other Beverages }
Schedule 9.—Cotton Manufactures.
Schedule 10.—Flax, Hemp, and Jute, and Manufactures of.
Schedule 11.—Wool and Manufactures of.
Schedule 12.—Silk and Silk Goods.
Schedule 13.—Papers and Books.
Schedule 14.—Sundries.
Schedule 15.—Free List.
Special and Administrative Provisions, and Appendix containing briefs received too late for printing in the volume containing the hearings upon the various schedules.

LEIGHTON C. TAYLOR, *Clerk*.

SCHEDULE 6.

TOBACCO AND MANUFACTURES OF.

TURKISH TOBACCO.

[Paragraphs 601 and 605.]

STATEMENT OF JUNIUS PARKER, NEW YORK CITY, REPRESENTING AMERICAN TOBACCO CO.

The CHAIRMAN. Mr. Parker, you reside in New York and represent the American Tobacco Co.?

Mr. PARKER. Yes, sir; I reside in New York City, and I am the general counsel of the American Tobacco Co., but in this hearing, at the instance of, I think, all cigarette manufacturers, I represent them. I say I think I represent all of the cigarette manufacturers, at least the larger cigarette manufacturers.

The CHAIRMAN. Will you give a list of the cigarette manufacturers represented by you?

Mr. PARKER. The R. J. Reynolds Tobacco Co.; Liggett & Myers Tobacco Co.; P. Lorillard Co. (Inc.); the Tobacco Products Corporation; Larus & Bro. Co.; Bloch Bros. Co.; and I have also been asked to speak on behalf of or represent the Tobacco Merchants' Association of the United States, which includes in its membership substantially all of the other cigarette manufacturers.

The CHAIRMAN. How many of them are there?

Mr. PARKER. The last report of the Internal Revenue Commissioner shows about 200; that is, 198 or 200 or 201; I do not answer exactly.

The CHAIRMAN. In general, the cigarette manufacturers?

Mr. PARKER. In general, the cigarette manufacturers.

The CHAIRMAN. Where are they located principally?

Mr. PARKER. A good many of them in New York, a good many in Illinois, and some in New Jersey; the smaller cigarette manufacturers are usually in the large cities and their brands have a large but local consumption.

The CHAIRMAN. Have you a list of these some 200 other manufacturers, Mr. Parker?

Mr. PARKER. No, sir; I have not, Senator.

The CHAIRMAN. They are in the report of the Commissioner of Internal Revenue, are they?

Mr. PARKER. No, sir; the names are not in the report, but the number is in the report.

The CHAIRMAN. Where could the committee get the names?

Mr. PARKER. Mr. Dushkind has the Tobacco Merchants' Association list of these cigarette manufacturers.

Mr. DUSHKIND. We have a partial list that is not altogether official.

The CHAIRMAN. Could the committee be furnished with a list as complete as may be?

Mr. PARKER. Certainly, sir.

The CHAIRMAN. Proceed, Mr. Parker.

Mr. PARKER. The provision of the Fordney tariff bill which I shall discuss is that provision which advances the rate of duty on Turkish tobacco from 35 cents to $1 a pound. I earnestly protest against that increase or any increase, on behalf of all of the cigarette manufacturers.

The language of the Fordney bill is confused, but I need not stop to discuss at any length that confusion. There is a provision that filler tobacco shall be increased from 35 to 45 cents a pound for unstemmed and from 50 to 60 cents a pound for stemmed, with the provision that that class of filler tobacco that is habitually used without stemming shall bear the same rate as stemmed tobacco; that is, 60 cents a pound instead of 45; and Turkish tobacco is about the only tobacco that we know of that is used without stemming, and on that there would appear to be imposed a duty of 60 cents. But then it provides further that the tobacco that is known as Turkish shall bear a rate of $1 a pound.

I understand there have never been any hearings before the Ways and Means Committee, but I understand also that this increase in the rate on Turkish tobacco was induced on the theory that California could grow Turkish tobacco if it were properly protected, and it was for that reason that I had some anxiety to hear Mr. Aram, who, so far as I know, represents the California Turkish tobacco growing industry. I do not know upon what basis this request is to be made, because I have never heard Mr. Aram.

Senator SIMMONS. Have they, up to this time, grown any tobacco of the Turkish type in California?

Mr. PARKER. No, Senator. No tobacco has ever been grown of the Turkish type, in my judgment, in California. The total California crop of tobacco—which is California tobacco and not Turkish tobacco—in the year 1920 was 200,000 pounds, as stated in the memorandum filed by Mr. Aram with the Ways and Means Committee.

Senator SIMMONS. Is that essentially different from the other cigarette tobaccos grown in this country?

Mr. PARKER. Essentially different? Yes; I think in the same sense that burley is different from Virginia, and in the same sense that Wisconsin is different from Maryland, and not otherwise.

Senator SIMMONS. Would the California product in any way take the place in the manufacture of cigarettes of Turkish-grown tobacco?

Mr. PARKER. Not at all; it is not substitutable.

Before I proceed with the California situation——

Senator LA FOLLETTE (interposing). In what respect is it similar to the Turkish tobacco, if there is any similarity?

Mr. PARKER. There is some similarity. The similarity comes from its being grown from Turkish seed, and the first crop that is grown from the fresh seed preserves some of the characteristics of the seed from which it is grown, the differences being made by the soil and the climate, precisely like Wisconsin tobacco has a resemblance to

Cuban tobacco, because it originated from the Cuban seed. But before we get to this California matter, if you will permit me, allow me to refer to some of the general considerations.

There is imported into this country substantially 40,000,000 pounds of Turkish tobacco. An advance of 65 cents a pound would be an advance of substantially $26,000,000 on that importation. There are produced in this country substantially 50,000,000,000 cigarettes. The production in the last fiscal year came down to about 47,000,000,000 from about 53,000,000,000 the year before. But there has been some picking up of the business since, because of the introduction of some new and cheaper brands, so I think it is fair in round numbers to say that there is a business in this country of substantially 50,000,000,000 cigarettes, and there are 40,000,000 pounds of Turkish tobacco imported—a proposed increase, therefore, of the tax on cigarettes of $26,000,000 is, as applied to the whole cigarette business, an increase of substantially 50 cents a thousand.

Senator LA FOLLETTE. What is the value of those 40,000,000 pounds of imported Turkish tobacco?

Mr. PARKER. It varies very much.

Senator LA FOLLETTE. I suppose it does.

Mr. PARKER. In a general way, I think that as an average it costs 55 to 70 cents in Turkey, with 35 cents a pound additional, or a little more than $1 a pound, duty paid.

The Ways and Means Committee and the Senate Finance Committee, with no hearings before either, but with the information derived from the Treasury Department and from the Revenue Department, concluded, and I think very wisely, that no branch of the tobacco business could be safely subjected to increased taxes. The only branch that seemed flourishing at all, and even that had fallen off 11 per cent, was the cigarette business. Therefore, I think that there has been an adjudication, as it were, that there ought not to be an addition of 50 cents a thousand to the cigarette tax, and that is what this proposed advance would amount to as a revenue measure spread over the whole cigarette business.

The CHAIRMAN. Did not the Secretary of the Treasury suggest the propriety of raising the tax for internal revenue?

Mr. PARKER. He gave that as one of the suggestions; I never understood that he suggested it otherwise than to give a list of things from the taxation of which a deficit might be covered.

Senator SIMMONS. The Secretary of the Treasury, if the chairman will pardon me, and Dr. Adams, speaking not, I believe, of tariff duties, suggested and stated that in their opinion the tax now imposed upon tobacco was as high as it was profitable for revenue purposes.

Mr. PARKER. That has been my understanding. There were no hearings before the Finance Committee; there were no hearings before the Ways and Means Committee. But every line of the tobacco business had fallen off; the cigarette business had fallen off over 5,000,000,000, or 11 per cent.

Senator SMOOT. Of course, Mr. Parker, you know that the amount of cigarettes now has even increased.

Mr. PARKER. Are increasing compared with those months which showed a falling off?

Senator SMOOT. Yes.

Mr. PARKER. And I wanted to deal, Senator, with the utmost frank-ness—I have a feeling that part of that decrease in 1920 was that pe-culiar condition, beginning in the fall of 1920, of stagnation, but I do think you ought to remember this——

Senator SMOOT (interposing). There was another reason also, Mr. Parker. Of course, there were quite heavy purchases before that slump in the number sold, and now that has all been disposed of and it is normal again.

Mr. PARKER. No, Senator, it is not normal again, and I will tell you why.

Senator SMOOT. What I meant to say was that the stock is normal, and the purchases are normal, and there is the regular rate of buying; they have to buy as they need them.

Mr. PARKER. No. I will tell you what is reflected in the reducing costs of tobacco. The American Tobacco Co. got out a cheaper brand called "111." The Liggett & Myers Tobacco Co. got out a cheaper brand and the Lorillard Co. got out a cheaper brand; and the tobacco people believe that the increases lately have been from the distribu-tion of those new brands which have not gone into consumption. But, Senator, the fiscal year 1920 showed 53,000,000,000; the fiscal year 1921, or ending June 30, 1921, showed 47,000,000,000.

I was assuming—and I believe, so far as we can judge, that is a fair assumption—that we have a business of substantially 50,000,-000,000.

Senator MCLEAN. What did you say the consumption in 1914 was?

Mr. PARKER. The consumption in 1914 was very much less. I have the figures here given by the commissioner's return. I haven't it in fiscal years; this is calendar years. In 1914 the business was only 16,000,000,000.

Senator MCLEAN. And the increase has been very rapid, has it not?

Mr. PARKER. It has been very rapid; the increase in the cigarette production in this country has been enormous. In 1910 it was only 8,000,000,000; in 1919 it was 53,000,000,000; in 1920 it was 47,000,-000,000.

Senator WATSON. What about the imports during that time?

Mr. PARKER. Of what—Turkish tobacco?

Senator WATSON. No, cigarettes?

Mr. PARKER. Very slight. The importation of Turkish tobacco has increased.

Senator LA FOLLETTE. In what branch of the cigarette business was there a slump—in the whole?

Mr. PARKER. So far as I know, in the whole business.

Senator LA FOLLETTE. If there was a diminution in consumption, have you any means of knowing in what grade of cigarette consump-tion there was a falling off?

Mr. PARKER. No, Senator; I do not think there is anybody who is informed. Different brands fared differently, but I do not think it was in any particular grade of consumption.

Senator MCLEAN. How about the price; was that increased?

Mr. PARKER. The price of cigarettes has been increased from time to time with the increase in taxes, and the price has been maintained high because of the tremendous increase in the cost of leaf tobacco. Prices are now going down, first by putting out new brands that se

20 for 15 cents instead of 20 for 20 cents, and, second, in the reduction in the price of staple brands.

Senator McLEAN. You are doing a pretty good business now, I take it?

Mr. PARKER. The cigarette manufacturers?

Senator McLEAN. The American Tobacco Co.

Mr. PARKER. The American Tobacco Co., yes. The American Tobacco Co. is doing a good business, but the American Tobacco Co.'s rate of profit on output or rate of profit on capital is not higher now than it was in 1912.

Senator LA FOLLETTE. How high is it?

Mr. PARKER. The last annual report of the American Tobacco Co. showed a rate of profit on its capital investment of about 10 per cent, and a rate of profit on its output of about 11 per cent.

Senator McLEAN. I think I saw in the paper the other day that the American Tobacco Co.'s earnings on common stock was something like 20 per cent.

Mr. PARKER. I think that is so, but that is because our common stock is small and our preferred stock and bonds, with a low rate of interest, is very large.

Senator LA FOLLETTE. What is your common stock?

Mr. PARKER. The common stock was $40,000,000 as compared with over $100,000,000 of other securities. A stock dividend was declared some time ago. But the report of the American Tobacco Co., differing in that respect from the other tobacco companies, beginning as far back as 1905 or 1906, has constantly given the amount of sales, the amount of profit, the percentage of profit on the sales, and the percentage of profit on the invested capital.

Senator McLEAN. What do you handle besides cigarettes?

Mr. PARKER. Tobaccos.

Senator McLEAN. Leaf tobacco?

Mr. PARKER. Oh, no; not leaf tobacco. We are manufacturers of established brands, like Bull Durham; plug and smoking. Then we are interested in a cigar company by stock ownership; I mean publicly interested in the American Cigar Co. So the American Tobacco Co.'s activities include the whole field.

Senator McLEAN. The American Cigar Co. buys leaf tobacco?

Mr. PARKER. It buys leaf tobacco as the American Tobacco Co., because it has to do it in order to manufacture.

Senator McLEAN. So that you are interested in leaf tobacco?

Mr. PARKER. Oh, tremendously interested in our raw material, but I thought you meant dealing in leaf tobacco.

Senator SMOOT. You are objecting to the putting of $1 per pound on filler tobacco, known as Turkish tobacco. If that $1 a pound was taken off, are you still objecting to the increase on filler tobaccos not specifically provided for, increased from 35 to 45 and from 50 to 60 cents?

Mr. PARKER. Yes, sir. But I would not discuss that, Senator, because that is largely a cigar proposition, and the cigar industry is represented here.

Senator SMOOT. Then you are simply objecting to the rate of Turkish tobacco of $1 a pound?

Mr. PARKER. That is so. I said, in the first place, that I did not believe the cigarette industry would stand an increase of 50 cents a thousand.

Senator WATSON. What proportion of the cigarettes made in the United States does your company make?

Mr. PARKER. I think about 20 per cent.

Senator WATSON. Do you use Turkish tobacco in all the cigarettes?

Mr. PARKER. We do not use Turkish tobacco in all the cigarettes we make.

Senator WATSON. In what proportion of the cigarettes that you make do you use Turkish tobacco?

Mr. PARKER. In 80 per cent—not the American Tobacco Co., but the cigarette industry of the country. And there we come to the gross injustice of this proposed increase of rates.

Senator WATSON. Do the other cigarettes made by other companies contain Turkish tobacco in the same proportion?

Mr. PARKER. They differ. The Liggett & Myers Co. has a brand called "Piedmont," much advertised, which is pure Virginia. The American Tobacco Co. has a brand called "Sweet Caporal" that has a small infusion of Turkish.

But the three leading brands in this country to-day in sales are Camel, Lucky Strike, and Chesterfield; and every one of those uses a proportion of Turkish tobacco. I know how much Lucky Strike uses, but I do not know how much Camel uses and I do not know how much Chesterfield uses, and I suppose the manufacturers do not think I would be perfectly reliable in telling how much Lucky Strike contains, and I am sure they would not be in telling how much Turkish these other brands use.

But you noted that tremendous growth in the cigarette business. That tremendous growth is precisely coincident with the development of the blended cigarette. In 1910 there were hardly any blended cigarettes made; in 1920 we consider that 70 per cent of all the cigarettes made are blended cigarettes.

Senator WATSON. What do you mean by that?

Mr. PARKER. There were 50,000,000,000 cigarettes manufactured in this country, and of that amount we think about 70 per cent are blended; about 20 per cent are pure domestic, and about 10 per cent are pure Turkish. Those are estimates.

Apply those percentages to the 50,000,000,000, and you have 35,000,000,000 cigarettes that are blended, some 10,000,000,000 that are pure domestic, and some 5,000,000,000 Turkish.

Senator WALSH. And in the blended cigarette is the Turkish tobacco usually used?

Mr. PARKER. You can work that out pretty well. Forty million pounds are brought into this country; at the rate of about 3 pounds per thousand to make the 5,000,000,000 pure Turkish requires about 16,000,000 pounds. If you deduct that you will have 24,000,000 pounds, and when you divide that 24,000,000 pounds into the 35,000,000,000 cigarettes you get about 20 per cent Turkish.

I have no doubt that some brands use more than 20 per cent Turkish; for instance, Fatima and Omar. I have no doubt some use less than 20 per cent; but it is about 20 per cent, those figures show.

Senator WALSH. In the blended cigarette?

Mr. PARKER. In the blended cigarette. Now, 20 per cent of the tobacco being Turkish, 80 per cent or four times as much is domestic, and unless we cigarette manufacturers are wrong, the development of this blended business has meant what? That in the blended cigarettes alone we are consuming 96,000,000 pounds of domestic-grown tobacco—grown in North Carolina, Virginia, South Carolina, and Kentucky, because burley has come to be used in cigarettes very much now.

There are 96,000,000 pounds of domestic used in making these blended cigarettes, whereas in 1910 the total cigarette consumption of leaf tobacco in this country was only for 8,000,000,000 cigarettes, or about 35,000,000 pounds.

Therefore, Mr. Chairman and gentlemen of the committee——

Senator WATSON (interposing). Is there a greater demand by the trade for the Turkish cigarette than the ones purely American?

Mr. PARKER. Generally. But, of course, the cigarettes are successful when they appeal to the smoker.

Senator WATSON. That is what I am asking about.

Mr. PARKER. If you want to know what are the most popular ones, judged by the volume of sales, I think I have indicated it by saying 70 per cent in volume of sales are the blended cigarettes.

Senator McLEAN. They are cheaper than the pure Turkish?

Mr. PARKER. They are cheaper than the pure Turkish, but the same price as the pure domestic. Take Liggett & Myers Co. It has two brands of cigarettes, both of which are distributed well and both of which are manufactured well. One is called the "Piedmont," an older cigarette brand; the other is called "Chesterfield." I do not know their figures. They sell at the same price, but I venture the statement that Chesterfield outsells the Piedmont two to one.

Senator McLEAN. Do you think the average smoker can tell the difference with his eyes shut?

Mr. PARKER. Yes; I think he can.

Senator McLEAN. Or with them open?

Mr. PARKER. I think if he did not tell by the first cigarette that he will tell in the consumption week in and week out.

Senator McLEAN. You say this enormous increase in the consumption came with the blended cigarette. It also came with the war, did it not?

Mr. PARKER. No, indeed, Senator. It began long before the war.

Senator McLEAN. It "began"?

Mr. PARKER. No, indeed. You see, these figures do not include export figures, because export cigarettes do not pay any internal revenue. Therefore, I can go right up the line. In 1910 it was 8,000,000,000; in 1911 it was 10,000,000,000.

Senator WALSH. Of what?

Mr. PARKER. Of cigarettes.

Senator WALSH. Of all cigarettes?

Mr. PARKER. Of all cigarettes.

Senator WALSH. I was asking about the blended cigarettes. He asked you if the blended cigarettes had not increased during the war.

Senator McLEAN. The cigarettes increased enormously during the war. It might have began before the war.

Mr. PARKER. The increase, so far as our soldiers consumed them in France, is not reflected here at all.

Senator McLEAN. But they got the habit there?

Mr. PARKER. The increase has been in greater proportion——

Senator McLEAN (continuing). And I assume they have not dis continued the habit on the return very largely?

Mr. PARKER. In 1910, it was 8,000,000,000; in 1911, it was 10,000, 000,000; in 1912, it was 13,000,000,000; in 1913, it was 15,000,000,000 in 1914, 16,000,000,000; in 1915, 17,000,000,000; in 1916, 25,000, 000,000. But we had not gone into the war in 1916.

Senator McLEAN. No; but the war was on.

Mr. PARKER. But these figures do not include those shipped t foreign Governments. because they do not buy internal revenu stamped goods, and therefore they are not a part of these figures.

Senator McLEAN. You have got 25,000,000,000 to account fo after the war began, which is something of an increase.

Senator WALSH. Why is it that blended cigarettes are not mor expensive than domestic cigarettes, in view of the tariff?

Mr. PARKER. Well, in the first place, domestic leaf tobacco ha been very high. For instance, I am familiar with the Lucky Strik brand, because I represent the American Tobacco Co. always. Afte the armistice, when burley tobacco remained very high and whe shipping facilities were established well with Turkey, and the crop from there came over, our Turkish content in Lucky Strike cost us les than the Burley content. But that did not induce us to put in mor Turkish, because we had a blend that had shown its popularity, an whether a blend is popular or not depends not on relative prices; an it does not depend on relative qualities, except as the quality appeal to the smoker.

The American Tobacco Co. makes pure domestic cigarettes, a well as blended, and its livelihood is not dependent upon the Turk cigarette.

Liggett & Myers Co. makes pure domestic cigarettes and blend cigarettes. The Reynolds Tobacco Co. makes blended cigarette But if you take the small manufacturers they almost all make pu Turkish cigarettes; and to increase——

Senator SMOOT (interposing). Pure Turkish?

Mr. PARKER. Pure Turkish—the small manufacturers; it is th local men in the cities, and so on. Their business is almost all pu Turkish.

Now, if you increase the duty as proposed in this bill, you increa the tax per thousand on the pure Turkish cigarette to the extent $2 a thousand. The internal-revenue tax now is $3. The duty 35 cents, 3 pounds to the thousand, makes a total of $4, and ther fore you will have a tax which would apply to the pure Turki cigarette of $6 a thousand, which is simply, in my judgment, pr hibitive.

Besides that, you are doing a vast injustice in putting this add tional revenue of $26,000,000 not on the whole industry but on th particular brands, because particular brands have been adverti and built up at the expense of tremendous sums of money; and wh you destroy the blend, when you destroy the formula of manufactur you have destroyed the brand. A brand that is 10 per cent Turki and 30 per cent burley and 40 per cent Virginia and 20 per ce Maryland—if it is to preserve its identity it has got to preserve th percentages, and to legislate to impose a tax falling unequally

lifferent manufacturers is the height of injustice to the manufacturer. And in saying that I am not particularly speaking in the interest of the American Tobacco Co., because that injustice can better be stood by he American Tobacco Co. and Liggett & Myers than any other two nanufacturers. Take such as Lorillard, the Tobacco Products, and he small manufacturers, and it would be destructive of their business.

I think, therefore, that from the point of view of revenue, from the point of view of the conservation of established brands and businesses, rom the point of view of the interests of the Virginia, North Carolina, nd Kentucky growers, that any increase on the tax on this Turkish eaf is very disastrous. Senator Simmons, at least, will remember hat 10 years ago, or 12 years ago, when the pure Turkish business vas growing, some North Carolina farmers and Virginia farmers, or pokesmen for them, took up with some Members of the Senate and House from North Carolina and Virginia the question of the increase n duty on Turkish tobacco for the protection, as they said, of Virginia and North Carolina tobacco. They abandoned that; it never was brought before any committee, because they came to realize, even at that time, that the blended cigarette had potentialities o the great benefit of Virginia and North Carolina farmers and not o their detriment; and time has shown the wisdom of that abandonment, because, as I said a minute ago, at that time the total tobacco used in cigarettes of all sorts was only about 35,000,000 pounds, whereas to-day in our blended cigarettes alone, disregarding for the moment pure Turkish and pure domestic, we are using 96,000,000 pounds of domestic tobacco.

Senator SIMMONS. Are any of the producers of cigarette tobacco demanding additional grade as a matter of protection?

Mr. PARKER. One. Mr. Aram, of California.

Senator SIMMONS. And that is upon the ground that they may aise it?

Mr. PARKER. As a substitute for the Turkish. No suggestion has come from the burley growers of Kentucky, the Virginia growers, North Carolina or South Carolina growers, or from any other section of the country—no slight suggestion has come that this duty should be raised, because they recognize—every intelligent one does—that it would jeopardize and be likely to be destructive to their interests to have this Turkish tobacco eliminated, believing, as they do, from seeing the growth of brands, that the very largest selling brands, the most popular brands, the brands that appeal the most, to the extent of 70 per cent of the entire production in this country, are brands that carry with them a little Turkish and a lot of domestic.

Senator SIMMONS. You have been speaking up to this time with reference to the cigarettes consumed in this country. Now, with reference to the cigarettes that you export, do you not export a large number of cigarettes?

Mr. PARKER. We export very few.

Senator SIMMONS. Do you mean the American producers, or are you speaking of your own company?

Mr. PARKER. I speak of my company now.

Senator SIMMONS. I am speaking of the whole industry.

Mr. PARKER. Senator, there is not as much export of cigarettes as there used to be. Every country is differentiating in favor of the domestic manufactured goods instead of the imported cigarette.

The British-American Tobacco Co. is a large exporter. It had fac-tories in Durham and Petersburg. But the British-American Tobacco Co. had to establish factories in China and India. The Imperial Tobacco Co. is a large user of American-grown tobacco, but its factories are in England. So the export of the manufactured cigarette from this country is falling off, and the inevitable tendency is to fall off, because every country differentiates in favor of the domestic-made product, as against the imported product.

Senator SIMMONS. What I had in mind to ask you is, do the for-eign consumers show the same preference for blended cigarettes that the American consumers do?

Mr. PARKER. I do not know, Senator. Camel cigarettes, I know, have a considerable export business. But as compared with the con-sumption of cigarettes throughout the world, the export from this country is insignificant.

It is suggested that this danger to the revenue, this injustice to the manufacturers, this injustice, in my judgment, to the leaf growers in Virginia, North Carolina, and Kentucky should be done—that this increased duty should be imposed--because a substitute for Turkish tobacco may be grown in California.

Senator SIMMONS. Mr. Parker, nobody is asking it, and for the present I am eliminating the California man, because we have not heard from him yet, and you say that up to this time there is no tobacco of the Turkish type produced, that they simply hope to pro-duce it in the future. There is nobody who produces a tobacco who is asking for this increase upon the ground that it is needed for the purpose of protection of the American product. This, then, assumes the aspect purely and simply of a revenue proposition.

Mr. PARKER. Except for California, it does.

Senator SIMMONS. Except for California—I eliminate that.

Mr. PARKER. Yes.

Senator SIMMONS. In reference to the revenue from the tobacco industry in this country, I was under the impression that according to the views of the Secretary of the Treasury and Dr. Adams, the expert, that we had gone to the limit in the revenue bill.

Mr. PARKER. I think you have gone beyond the limit of revenue production.

Senator WATSON. He made that statement here before the committee.

Senator SIMMONS. He did; that is my recollection.

Mr. PARKER. I think you have gone beyond the limit, so far as revenue is concerned. But if you have not, then I ask, in the name of justice to the manufacturers other than my own company, I ask in the name of justice to the tobacco growers in North Carolina and Virginia, that you protect the brands in their relative position by putting a flat tax on cigarettes.

It is not right, when there are no considerations of the proper protection of an American industry—it is not right, to destroy a man's brand, on which he has spent thousands of dollars advertising and selling, by requiring him to change the formula radically of his content, because when you have changed that formula you have destroyed that brand.

Senator MCCUMBER. How is the tax upon the mere brand of cigarettes going to be beneficial to those who desire to raise the tobaccos in California; how will it help them?

Mr. PARKER. It will not. Now, we come directly to this Cali-ornia situation. I am frank to say that, as I have heard it, this 'ordney bill tariff of $1 a pound was not intended as a revenue roducer; it was intended to protect and build up a so-called Cali-ornia production of Turkish tobacco.

We know a good deal about that California situation. The merican Tobacco Co. in 1909 or 1910 had a much larger proportion f the tobacco business of this country than it has now. We bought obacco in Turkey. We found conditions in Turkey uncomfortable, nd we spent thousands of dollars attempting to grow a substitute or Turkish tobacco.

The CHAIRMAN. Why did not these interests have a hearing efore the Ways and Means Committee?

Mr. PARKER. There was no hearing, as I understand, even from Ir. Aram. The first we ever heard of such was just about the time he Fordney bill was reported, and somebody found in an odd ariff hearing volume a memorandum filed by Mr. Aram, and there as no opportunity for a hearing. When we found it the hearings ad closed.

But, as I was saying, in answer to your quesion, the American 'obacco Co. literally spent thousands of dollars in attempting to row a substitute for Turkish tobacco, and in many other places has been experimented with—North Carolina, South Carolina, and alifornia.

Mr. Melachrino, the founder of a large Turkish cigarette business, he Melachrino brand, attempted the production of Turkish tobacco Colorado and California.

In 1911 the California business and the San Francisco business f the American Tobacco Co. was conveyed to the Liggett & Myers o. They continued the experiments that we had begun in Cali-ornia.

Mr. Drucklieb, a large Turkish leaf dealer in New York, tried it the Carolinas and in New Jersey, and we could not grow a substi-ute for Turkish tobacco, and that is not strange. Nobody has een able to grow a substitute for Cuban tobacco. You can not row in Wisconsin burley tobacco; you can not grow in Wisconsin orth Carolina tobacco.

Even if conditions in California, to the superficial observation, ere precisely similar to what obtains in Turkey——

Senator LA FOLLETTE (interposing). How extensive were your xperiments in California?

Mr. PARKER. They extended over several years. They involved n expenditure—we leased the land—of $20,000 or $30,000.

The CHAIRMAN. I see in the appendix of the Ways and Means eport that there is a brief on the Turkish tobacco question by the ssociated tobacco growers of California.

Mr. PARKER. That is what I said; that is what we first found, and think you will find it on page 4439.

The CHAIRMAN. Yes; that is the page.

Mr. PARKER. That is Mr. Aram's memorandum.

The CHAIRMAN. And that is the only information we have on this?

Mr. PARKER. That is all. Another consideration that has got to e taken into account is this: Reference is made to their ability to row Turkish tobacco in California, but really we think it is quite

like a man who would go to England, saying that he could grow American tobacco there.

The fact is that the Turkish tobacco production in that country is as large as the United States, and there is as much difference between Xanthi and Kavalha tobacco as there is between Wisconsin and North Carolina tobacco, and it would be a little absurd, from my point of view, for an Englishman who was born in Wisconsin to say, "Well, I have been able to develop American tobacco." He may, perchance, have been able to develop something somewhat like Wisconsin tobacco, but he has not been able to develop burley or Virginia or Maryland or perique.

Senator WATSON. Your contention is that this effort to grow Turkish tobacco in California has not succeeded in that it has not developed a real substitute for the Turkish?

Mr. PARKER. Absolutely, and never will.

The CHAIRMAN. Will you permit me, Mr. Parker? The committee has agreed, as well as the experts, that we must finish this schedule to-day. We recognize you as the chief speaker on the one side of the question and Mr. Dushkind and his associates on the other, as I take it?

Mr. PARKER. No; there is no disagreement between Mr. Dushkind and his associates and myself. It is Mr. Aram.

The CHAIRMAN. The committee appreciates the value of your remarks, but we must limit these things in reason. Have you come to any agreement with those holding opposite views on this question as to the time?

Mr. PARKER. No; I never met Mr. Aram.

The CHAIRMAN. Is there any gentleman present who desires to be heard on the same subject as you?

Mr. PARKER. I think they do not desire to be heard, if I cover the question.

The CHAIRMAN. You will no doubt cover it thoroughly, as you have done in past years.

Mr. PARKER. I was going to say that, in the first place, we know California will not grow Turkish tobacco, because we have tried it and other manufacturers have tried it. In the second place, we are not surprised that it will not, because when you try to develop the aroma, the flavor, the body of a type of tobacco grown in one section in another 5,000 miles away, the chances are all against you.

Then we know, even superficially, that California is not like a great part of the Turkish territory. The extremes of heat and cold are different and fluctuate more rapidly. The season, so far as moisture is concerned, is different. But if you want what I think is the best theoretical advice as to whether California tobacco is Turkish tobacco, I suggest that you would have no better witness than Dr. Garner, who is the head of the leaf tobacco division of the Agricultural Department.

Moreover, in 1917——

Senator WATSON (interposing). Can the difference be detected by chemical analysis?

Mr. PARKER. I have no doubt it could, Senator, but chemical analysis of tobacco is not very satisfactory. You can determine it much better by smelling it; you can determine it much better by smoking it. But we would like to buy California tobacco; we would

ve to use California tobacco. Ultimately the production and use f California tobacco would be an economy to us. But it can not e done.

Now, what has been the history of that crop? Mr. Aram is an riental, an Armenian, I believe.

Mr. PARKER. There are several people in his section who have had n experience in Turkey, in Armenia, in growing tobacco. Now, they ave gotten Turkish seed. They have attempted to bring about a ubstitute for Turkish tobacco. In 1920 they grew 200,000 pounds, s Mr. Aram's brief says. He believes—and I have not a particle of oubt he is sincere in his belief—that he can grow tobacco that approximates Turkish. But here you have an industry 10 years old hich produces 200,000 pounds, and you have a consumption of urkish tobacco in this country to-day of 40,000,000 pounds.

Senator SHORTRIDGE. In 1920 there were 700,000 pounds produced instead of 200,000.

Mr. PARKER. Senator, I have not any information about it at all, xcept as contained in Mr. Aram's memorandum, and Mr. Aram ays in his memorandum the production is as follows: In 1906, 500 ounds; in 1910, 300,000 pounds; in 1919, 1,000,000 pounds; in 1920, 00,000 pounds. And then from 1906 to 1920, inclusive, or a period f 15 years, 6,500,000 pounds.

Senator SHORTRIDGE. Having made the statement I did, Mr. hairman, it is only just and proper to add that I have the crop gures verified, and we offer them as correct, showing the production of Turkish tobacco in California from 1906 down to and including 1920. In the year 1906 it was 500 pounds. I will not trouble ou at the moment to read the output each year successively. But n 1907 it had increased to 9,500 pounds; in 1908, 30,000 pounds, and o down—I pick up the matter at 1917, when there were 498,000 ounds; in 1916 there were 870,000, and in 1919, 1,525,000. It fell ff in 1920 to 700,000 pounds, for reasons which can be explained.

Mr. PARKER. Senator, you will quite understand I am not attacking the correctness of the figures, but I am justifying my statement, ecause it was entirely in good faith and on the statement made in Mr. Aram's brief.

Senator SIMMONS. I understood you to say that this California tobacco, spoken of as Turkish tobacco, is not of the Turkish type.

Mr. PARKER. It is not Turkish tobacco at all; it is California obacco. Ask Dr. Garner; ask any tobacco man. The Tobacco Products Co., whose president is here, has used some of the tobacco. He is using some now.

Senator SIMMONS. Is it bought in this market as Turkish, and do hey pay the prices obtained for Turkish tobacco?

Mr. PARKER. I did not understand.

Senator SIMMONS. Is it bought in this market as Turkish tobacco, nd by the concerns that buy and use it and pay for it the price they ould have to pay for Turkish tobacco?

Mr. PARKER. Not at all. The president of the Tobacco Products o. tells me he has negotiated for the purchase of some of this Californa tobacco in North Carolina. It has been taken down to North arolina and subjected to the process of redrying that is common in omestic tobaccos, and which is never applied to the Turkish tobacco.

He says it is the best California he ever saw. He is offering 35 cent and the man wants 40 cents.

Senator WATSON. Has that company attempted the use of Cali fornia tobacco in the manufacture of cigarettes?

Mr. PARKER. Not to any extent. Our company attempted som little use when endeavoring to grow it, and we never found it pleas us. The Tobacco Products Co. did try it, and still use it, and it entirely conceivable that if the California tobacco growers woul really produce tobacco and reach a dignity of output, if I may express it, it may be that somebody will get a blend and use some of i

Fifteen years ago, Senator, burley tobacco was not used in cigar ettes except by some manufacturers down in New Orleans, and i was a tradition of the trade that burley cigarettes would not outside of the Gulf States. But when Camel came and when Luck Strike came and Chesterfield came, the manufacturers were able blend with their Turkish Maryland and burley in cigarettes th hit the popular consumption, and nobody can foretell what combin tion will hit. But it is not Turkish tobacco, it never has been Tur ish tobacco, it never will be Turkish tobacco, and you had just well talk about protecting the banana business in order to creat banana business in Maine.

If the California growers grow tobacco and keep on growing i they may get some results. Mr. Dixon, of the Tobacco Products C told me this morning, "I am using this California tobacco. I d not think of it as Turkish tobacco at all. But I got up a cigaret that sold on the East Side in New York that contains some Turkis some burley, some Virginia, and some California. It is called 'Aft noon,' and it is selling fairly well."

But Mr. Dixon says further that "Under the stress of war tim and the impossibility of getting Turkish tobacco, I did try an expe ment once with this California tobacco as a substitute for Turkis I put in 10 per cent in three brands—Royal Nestor, Oxford, an Arabs; and those three brands were living brands when I put it i and they are dead now."

The smoker wants, gentlemen of the committee, what he wants.

The CHAIRMAN. Does the smoker show any bad effects from t consumption of these cigarettes?

Mr. PARKER. From the California tobacco?

The CHAIRMAN. Of the brand that died out?

Mr. PARKER. No, I think not. Of course, it is a very dangero thing, Senator, to experiment with the formula under which y brand is made, because there is a very intimate touch, and when account of the high cost of some particular grade of tobacco as co pared with the abundance of some other grade, the manufactu tries a substitution——

Senator MCLEAN (interposing). Do they put anything into cig rettes besides tobacco?

Mr. PARKER. Pure Turkish, no. The pure Turkish cigarettes, it my understanding, have only the tobacco. Virginia cigarettes, li Sweet Caporal and Piedmont, carry, I think, some sugar and th carry a little glycerin, because glycerin has an affinity for moistu and it is used in small quantities so that they may retain a fairly m condition. Camel and Lucky Strike cigarettes, I think, have add to them some chocolate, maybe, and maple sugar, and those ingre ents that frequently go into the burley tobaccos.

If not uninteresting to you, Senator, the Camel cigarette was pro-
uced by the Reynolds Tobacco Co., and it had made a tremendous
ccess in Prince Albert tobacco, and I have always had an impression
hat the Camel cigarettes carried with it some of the flavoring that
ad made the Prince Albert so popular. I know that Lucky Strike
as in it some of the flavoring and process of manufacture that being
pplied to Lucky Strike and Tuxedo tobacco had made them very
uccessful.

But if you mean to ask if there is anything in cigarettes that is
armful, unless tobacco is harmful; if you mean to ask whether there
s any dope in them; if you mean to ask whether there is a thing in
igarettes that has any harm in it, then I say with all emphasis, no;
nd I speak not only for my own company but I speak with emphasis
or every cigarette manufacturer in the United States.

So far as we conceive it, this is an attempt to carry the doctrine
f protection clean beyond any limits that have ever been suggested.
t is not to protect an industry, but it is to protect a hope and a vain
ope, and a hope that the theorist and the practical man condemn.
With all deference to the doctrine of protection, and with all defer-
nce to the productivity of California, it seems to us it is going too
ar and that this committee is not going to, as the House committee
vould not if hearings had been had, do the injustice to the industry,
he revenue, the owners of the brands, and the tobacco planter.

Senator WATSON. Do you want to strike out the whole dollar a
ound or modify it?

Mr. PARKER. I propose to strike out all the increase. I propose that
he tax on Turkish fillers or cigarette fillers be, as it has been since
1882, no higher than on cigar fillers. And so far as I have had any-
thing to say about the cigar industry, I have urged that that filler
ought not to be advanced over 35 cents.

STATEMENT OF HON. SAMUEL M. SHORTRIDGE, SENATOR FROM CALIFORNIA.

Senator SHORTRIDGE. Mr. Chairman, I will take but a very few
moments of the committee's time. I will very gladly follow the
suggestion of the chairman, and permit Mr. Aram, of California, to
present the matter more in detail.

I think it is proper, at the very outset, to say that the gentleman who
has just addressed you is in error when he says that the Ways and
Means Committee asked an ex parte statement. I am well informed
as to the action taken by the House committee. I understood him
to state that there had been no presentation of this matter to the
House committee, that no one had appeared, no one had been heard.
I understand that the matter was taken up before a subcommittee
of the Committee on Ways and Means and very thoroughly dis-
cussed, broadly and in detail, arguments for and against the proposed
increase being presented.

Senator SIMMONS. Is that discussion in the records of the Ways
and Means Committee?

Senator SHORTRIDGE. I am not able to answer, Senator, but I was
struck with the gentleman's remark, and turned to Mr. Aram, who
advised me as he will in turn advise you from his own knowledge.

I think it proper to have our minds fixed on the fact that the term
"Turkish" tobacco is a generic term and used to differentiate be-

tween many members of the tobacco family. In the term "Turkish tobacco" are included over 20 varieties of tobacco. The notion seems to prevail that from Turkey, whatever her territory may now be, comes one specific, well-defined type of the plant known a tobacco, and that that well-defined and exclusive type bears th extraordinary term "Turkish," and, moreover, that that particula kind of tobacco can not be raised elsewhere on God's earth than i Asia Minor. Such a notion is altogether erroneous.

There has been submitted here to this committee a tabulate memorandum containing much detailed information which I trus the members of the committee will have opportunity to read and t consider.

So much in brief reply to the remarks of the scholarly gentlema who has spoken.

The CHAIRMAN. Senator, will you permit me to interrupt you moment?

Senator SHORTRIDGE. Yes.

The CHAIRMAN. Do you desire to have that pamphlet printed a part of your remarks?

Senator SHORTRIDGE. I very much desire it.

The CHAIRMAN. It will be inserted as part of the Senator's state ment to the committee.

Senator SHORTRIDGE. Thank you. Touching the soil and climat conditions prevailing in California——

Senator SIMMONS (interposing). Senator, let me direct your atte tion to one thought I have in mind?

Senator SHORTRIDGE. Certainly.

Senator SIMMONS. You say there are various types of tobacc produced. The question, it seems to me, before this committee that we are considering it from the standpoint of protection, wheth it ought to be protected or not, whether there is produced in th country, in California, or elsewhere, a type of tobacco which comes competition with the Turkish tobacco, selling at something like th same price that the Turkish tobacco would sell at, less the duty im posed. It is a question of competition. There may be a great man types, but is there a type so nearly approximating that in all th elements that enter into the desirability of that type for use in th manufacture of cigarettes?

Senator SHORTRIDGE. It may be known that I am a protectionis I believe in the doctrine of protection.

Senator SIMMONS. I understood that very thoroughly.

Senator SHORTRIDGE. In the theory and the experience of prote tion, and my immediate answer to your thought is that there is pr duced in this country and there is produced in California a tobac which we designate "Turkish tobacco," which comes in competiti with tobacco grown somewhere yonder in Asia Minor—whether be in Turkey proper or surrounding territory is neither here n there. You are quite right in suggesting that this question does i volve an application, and I hope a true American application, of t American doctrine of a protective tariff, the purpose of which is build up and sustain an industry in this country which can not, protected, meet competition with the foreign product.

As to California, I was about to say, you are all familiar with geography. There was published some time ago by our Geographi

ociety a very interesting bulletin in which learned men undertook o account for the peculiar climatic conditions of the Pacific coast, rom, say, the northern boundary of Washington State down to the outhern boundary line of California. Having regard to ocean currents, to trade winds, and air currents, to latitudes and to altitudes, o the direction of the ranges of mountains, to rainfall on the western nd eastern slopes of our mountains; taking all of these physical acts into consideration in an attempt to account for the peculiar ummer and winter climate of California, the conclusion arrived at as, in point of truth, somewhat as Socrates would say, "That I do ot know." And yet, there it is. There is that peculiar climate, ifferent as to temperature and rainfall on the eastern and western opes of our mountain ranges, and hard to account for. In brief, limate and soil of hillsides and valleys differ for reasons suggested.

I trouble you with these words to come to the point, that this type f tobacco, spoken of as "Turkish tobacco," which comes in competion with the tobacco grown yonder in Asia Minor, is now planted, ultivated, grown, and produced in some 10 counties in California— Fresno, Tulare, San Joaquin, Santa Clara, Placer, Mendocino, olo, Yuba, Sacramento, and San Diego. In other words, this obacco is raised in San Diego County, our extreme southern county, nd in Mendocino County, away up in what we speak of as northern alifornia, and along the foothills of the western slope of the Sierras, the east of the Sacramento and the San Joaquin Valleys. To reeat, the raising of this tobacco is not confined to any one locality small territory.

Senator McCumber. Senator, may I ask you a question right ere?

Senator Shortridge. Yes, sir.

Senator McCumber. You stated a moment ago that there were ry many different species or varieties of tobacco raised in Turkey, or hat is known as "Turkish tobacco." Are all of those varieties which you speak used in the blends which make our cigarettes, is there but one specific variety out of the great number that may raised in what we call Turkish territory?

Senator Shortridge. Frankly, Senator, I am not able to answer our question. I understand that various types or kinds are imrted from Turkey, but what or how many varieties, under what rticular subnames, are used in this blending process, I am not lvised.

Mr. Parker. I do not desire to interrupt, but I can supply the formation if I may. A great deal of Turkish tobacco is not brought this country at all, and is as worthless for purposes of American anufacture as any tobacco in the world. But the blends themselves nsist of several varieties. For instance, in Pall Mall cigarettes is said there are 42 varieties that go to make up that combination; d even when there is a 20 per cent blend of Turkish in cigarettes at may be a half dozen or a dozen different varieties of Turkish bacco, the Xanthi being used for aroma, the Kavalha for taste, d the Smyrna for burning qualities or combustion.

Senator McCumber. Are they imported already blended?

Mr. Parker. No. The skill—and sometimes good luck of cigarette anufacturers is in blending and balancing the quality of the Xanthi

for aroma, and Kavalha for taste, and Smyrna for burning or com-bustion qualities.

Senator McCumber. Let me ask whether or not the tobacco which you raise in California which you call Turkish tobacco consists of only one particular kind or whether you have the several species that are imported from Turkey?

Senator Shortridge. If you will permit me, Senator, I will allow Mr. Aram to answer that, because I am not able to do so with any degree of certainty. It has been suggested here that efforts were made to raise this kind of tobacco in California and that they were abortive or a failure. Of course, I do not recall what detailed effort they made, or in what quantities it was raised, or where, or by whom but I have stated that this tobacco is now raised in 10 counties of our State. Manifestly, there are counties where it could not be raised.

Senator Simmons. Senator, does that tobacco raised in your State sell in the markets of this country at much higher prices or any higher prices than the average tobacco sells?

Senator Shortridge. It takes on a different value because of the sum total cost of production. It is an essentially different plant in size, in cost of production, etc., from other kinds. I have an "im-pression," to use that word, that there are gigantic companies in this country whose interests are hostile to the development of this par-ticular brand of tobacco in California, and their interests and contro over the market may be such as to effect the price offered for this particular tobacco.

Senator Smoot. Do you know what the price for the 1920 crop was

Senator Shortridge. I do not have the figures before me; bu Mr. Aram will be able to advise you.

May I trouble you for a moment longer? It was said at one tim we could not raise what has been erroneously called "English walnuts in California. Well, we raise California walnuts, still sometim called English walnuts, in great quantity and of the very fines quality.

It was erroneously thought, and I have heard it stated in this room that we could not raise almonds in California equal to the product of France or Italy or other European countries, but the evidence, th fact, is we raise the finest almonds in the market to-day, an adequately protected we can supply the American market.

It was said originally that we could not raise certain kinds of grap in California. But that suggestion has been long ago disprove We raise every variety of grapes, and prices are better than formerl

Now, it is said here this day that we can not raise this particul type or kind of tobacco in quantity or of quality sufficient to grati the tastes of the American smoker who wants to smoke cigarett blended or made up of a quantity of something containing a litt "Turkish" tobacco.

Senator McLean. A little chocolate, glycerin, and sugar.

Senator Shortridge. Yes; chocolate, glycerin, sugar, and oth unknown x quantities. I take issue with the gentleman; I deny h contention; we are ready to prove that his claim, or the claim of h clients, is utterly unfounded.

Now, as to the raising of this kind of tobacco: We started in 1906, with 500 pounds. Well, for some reason men continued plant and to cultivate, and Mr. Aram, who is an Armenian—

ave quite a population of native Armenians in California—and amiliar with the cultivation of this particular tobacco, will give you etailed information as to the growth of the industry from 1906 to he present time.

Senator WATSON. Senator, since 1913 the tariff has been 35 cents pound, I understand, on the unstemmed, and on the stemmed 50 ents a pound, and with that tariff you have been able to increase our production of tobacco, as you have stated, and why is it necessary to raise the tariff to $1 a pound?

Senator SHORTRIDGE. That is a pertinent question which calls for n answer, of course. Conditions in the world change. The price f labor changes; the cost of production changes here and abroad. Ve have abnormal conditions.

Senator WATSON. That is what I was trying to get at.

Senator SHORTRIDGE. I have thought of these things, and they re all incorporated, and a satisfactory answer in substance to your uestion is set down here in this memorandum.

Senator WATSON. I just wanted to get that.

Senator SHORTRIDGE. Yes; thank you, Senator. Permit me to epeat a few of these figures: In 1906, 500 pounds; in 1908, 30,000 ounds; in 1909, 30,000; in 1910, 300,000; in 1911, 490,000; in 1912, 50,000; in 1913, 215,000; in 1914, 245,000; in 1915, 500,000; in 916, 800,000; in 1917, 498,000; in 1918, 870,000; in 1919, due to ood conditions and many elements contributing, 1,525,000 pounds; 1920, for reasons to be explained, 700,000 pounds.

Senator CALDER. The war gave you an opportunity to develop the obacco there and impressed the value of it upon the country?

Senator SHORTRIDGE. Yes, sir. In other words, gentlemen, whatver may be said to the contrary—probably by gentlemen who have ot had the pleasure of visiting California or who have not come in ontact with the physical facts there—whatever may be said to the ontrary, the fact is, the outstanding fact is, that commencing with 00 pounds in 1906—experimental, if you will—the industry has rown, employing many men, women, and children, and in every way as been and is an advantage to the State and, moreover, I think, n advantage to the Nation.

Now, one more thought to which I wish to call your attention, nd then I will ask you to listen to Mr. Aram. Something was said s to the consumption of cigarettes in America. I have figures here ommencing with 1912 down to and including 1920. In 1912 it eems that our people got along by smoking 11,239,000,000 plus igarettes. But in 1920 they consumed 50,448,000,000 plus.

Senator WATSON. The women have learned to smoke in that time. [Laughter.]

Senator SHORTRIDGE. Yes; I believe in one of our States they have assed a law making it a penitentiary offense to smoke cigarettes in ublic. Whether that law is being enforced I am not advised.

The CHAIRMAN. I think in the State of Utah they are not permitted o smoke them at all.

Senator SMOOT. Oh, yes, they are. I would not care if they were ot.

The CHAIRMAN. Are they permitted to smoke in private?

Senator SMOOT. Oh, yes.

Senator SHORTRIDGE. In the matter of exports, in 1912 our mer- chants and manufacturers were able to export and did expor 1,630,000,000 plus, and in 1920 15,833,000,000 plus. It appears tha those figures indicate that the consumption has increased vastly an that the exports have similarly increased.

Senator McLEAN. We exported 15,000,000,000?

Senator SHORTRIDGE. Yes; exported from the United States.

Senator McLEAN. What is the unit—pounds or cigarettes?

Senator SHORTRIDGE. Cigarettes. The reports mounted up fron 1,600,000,000 plus in 1912 to 15,833,000,000 plus in 1920.

I thank you very much, gentlemen. I repeat that the House com mittee listened to this matter and reached a conclusion. We though then—we think now—that the conclusion was right, not on behalf o California alone—I trust that my vision extends beyond the terri tory of that State—for if that conclusion involved an industry o North Carolina or Florida, and the facts were as they are, I woul pray the privilege to stand here and speak in behalf of that conclu sion and that industry. It does not affect California alone. Of course, we have a very large territory, and we are no inconsiderabl portion of this Union. You can take all of New England, New York and Ohio and lay them down on the soil of California, and still we would have some unoccupied ground.

Senator SIMMONS. Senator, you said a little while ago that there were certain interests in this country that were very antagonistic to the growth of this Turkish tobacco in your State—at least that is what I understood you to say.

Senator SHORTRIDGE. Yes, sir.

Senator SIMMONS. I am rather at a loss to understand why any interest in this country should be antagonistic to that. Certainly the manufacturer who uses it as a blend ought not to object to it, because if you grew there the Turkish tobacco he would not have to pay that duty on it. He would get it at the American price, less duty. Cer- tainly the producers of the ordinary types of tobacco in this country ought not to object to it, because it is very clear, I think, that the Turkish tobacco has popularized the use of his tobacco, has extended the use of it; and the cheaper that class of tobacco is bought by the manufacturer the greater price he expects to get for his type of tobacco.

Senator SHORTRIDGE. Yes, Senator; I appreciate the force of your words.

Senator SIMMONS. Therefore, it seems to me that both the manu- facturer and the producer of tobacco in this country ought to wel- come the production in this country of Turkish tobacco, if it can produced here.

The CHAIRMAN. What are the interests that are opposed?

Senator SHORTRIDGE. I will answer that in a moment. I ha always thought that the cultivation of this tobacco should be encou aged. But strangely enough, whenever this question of fixing tariff on an imported article arises, there develops this confli Upon the one hand, there will be importers, or manufacturers clos related with importers, who come forward and say that the Americ product, whatever it may be—agricultural or manufactory—can n be produced in quantity or quality equal to the imported artic Wherefore they oppose a rise in the tariff; wherefore they ar

ınd say that the American product from field or shop never can be leveloped or produced to meet the demand.

Senator WATSON. Have you any evidence to show that the large obacco companies in the United States are interested in the Turkish obacco in Turkey or the other countries which have been referred to?

Senator SHORTRIDGE. I have been informed that they are largely nterested in the importation of this so-called Turkish tobacco, and hat because of business interests and connections abroad they want 10 increase in the duty, lest it will interfere harmfully with their 10w vested interests and connections.

Mr. PARKER. You do not mean that any of the tobacco manufacurers are interested in Turkish lands, do you?

Senator SHORTRIDGE. I do not know that they have title to the Turkish lands themselves, nor do I undertake to so state; nor is it iecessary that they should have.

Senator SIMMONS. Let me ask you this question: Is it your undertanding that Turkish tobacco sells in this market for less than merican leaf tobacco?

Senator SHORTRIDGE. I understand the different grades and inds——

Senator SIMMONS (interposing). Well, this Turkish tobacco. In his market, leaving off the duty paid on it, does the invoice price of 'urkish tobacco fall, or has it ever fallen, below the price of American igarette tobaccos?

Senator SHORTRIDGE. I understand not.

Mr. PARKER. Generally speaking, of course, you are perfectly ight—Turkish tobacco with duty added.

Senator SIMMONS. Take the duty off.

Mr. PARKER. Take the duty off? It varies very much in type and rice. Mr. Dushkind tells me that the average import price of 'urkish tobacco in bond—that is, without duty—is 94 cents.

Senator SIMMONS. Has any tobacco ever produced in this country old for that much?

Mr. PARKER. Yes; Connecticut tobacco.

Senator SIMMONS. I am speaking of cigarette tobacco.

Mr. PARKER. No.

Senator SHORTRIDGE. Finally, gentlemen, if this rate which we re asking were designed wholly and exclusively for the benefit of 'alifornia, I would ask it. But I would follow it by the statement hat it can not in the movements of business in America be hurtful o the consumers in America.

If Connecticut asks a special rate for her tobacco, I favor it, if it ill develop that industry in that State, not because of Connecticut lone, though if it were so I would favor it, but in the development f our common country. The development of the West helps the outh; the development of the South helps the North; the building p of New England creates a market for the West and the South. herefore, while I do not appear here in behalf of California in any xclusive sense, still I ask you to consider her, her industry, her eople.

Senator SIMMONS. If Turkish tobacco was now selling at a higher rice than any other cigarette tobacco produced in this country, it ould seem that when you add—I mean, in bond—35 per cent, that ught to prove protective.

Mr. PARKER. I am told that the figures show that the average pric of Turkish tobacco was 94 cents during the year 1920; that was ir bond. That, of course, makes a duty-paid value of $1.30, virtually. The average price, as figured by some division of the Department o Commerce, of the domestic cigarette tobacco—that includes North Carolina, Virginia, burley, and others—was 41 cents.

Senator SIMMONS. Nearly double.

Mr. PARKER. More than double—41 as compared with 130, o substantially three times as much.

Senator SIMMONS. I have understood that the industries of th country claim absolute protection where the foreign was underselling the American product. But here is a case where the foreign produc seems to be selling for twice the domestic product, and still you wan more than 35 per cent.

Senator MCLEAN. About what is the percentage of the cost o material in the high-grade cigarettes to the cost of the cigarette I refer to the high-class Turkish cigarette, which I understand the sell for more than any other.

Mr. PARKER. Yes; the high-class cigarettes are the type which sell at from 25 to 30—Egyptian Deities and Pall Malls, etc.

Senator MCLEAN. Two and a half to 3 cents apiece?

Mr. PARKER. Yes.

Senator MCLEAN. What is the cost of the material in that cigarette

Mr. PARKER. Senator, I can not give the information, although can send it to you, because precisely that question came up not lon ago, and we analyzed the elements, and leaf cost is substantially th largest element of our cost.

Senator MCLEAN. I understood you to say about $4 a thousand?

Mr. PARKER. No; you misunderstood me. I said that the presen internal-revenue tax is $3. The cigarette uses 3 pounds to th thousand; therefore the tariff tax now prevailing, 35 cents a pound adds $1, making $4 of tax—not the cost. When you add to it—i you did add to it—the proposed addition, it would make $2, making total of $6 tax.

Senator SIMMONS. How much does the tobacco cost?

Mr. PARKER. If you say that the average cost of Turkish tobacc is 94 cents, I would assume that the average cost of Pall Mall an Deities would be $2.

Senator MCLEAN. Two mills to the thousand?

Mr. PARKER. No; $2 a pound, or $6 a thousand.

Senator MCLEAN. That is a cent and two mills; and that covers the cost of material in the highest-priced cigarettes?

Mr. PARKER. Of course, in those cigarettes you have very hig cost of wrapping material; that means fancy boxes and the paper and you have uniformally high-class paper in those high-cla cigarettes.

Senator MCLEAN. They are made by machinery, are they not?

Mr. PARKER. To an extent; but some are made by hand.

Senator MCLEAN. I wish you would hand to the committee th percentage of costs to the selling price.

Mr. PARKER. Does that mean the highest class cigarettes?

Senator MCLEAN. Yes; made out of Turkish tobacco—entirel Turkish tobacco. I understand you put in only a very small per centage of Turkish tobacco into the blends?

Mr. PARKER. Oh, no. We put, I would say, Senator, as I state o you, in a rather complicated way—the blended cigarettes carry o he average 20 per cent Turkish.

Senator McLEAN. One-fifth?

Mr. PARKER. That is one-fifth; yes. That Turkish is frequently f a lower price than very high class Turkish, but it bears, of course, duty of 35 cents.

STATEMENT OF ALFRED ARAM, FRESNO, CALIF., REPRESENTING THE ASSOCIATED TOBACCO GROWERS OF CALIFORNIA.

Senator McCUMBER. Mr. Aram, will you kindly state your full name and address?

Mr. ARAM. Alfred Aram; Fresno, Calif. I am president of the Associated Tobacco Growers of California.

Mr. Chairman and gentlemen of the committee, I can not expect to be as eloquent as the gentleman who represented the manufacturers, because this is my first experience in speaking at a public hearing before a committee of Congress, but I shall endeavor to put the facts as we know them before you.

I represent the Turkish-type tobacco growers in the State of California. That organization, I may say, is composed of farmers who actually grow the tobacco. We have a membership of some 300 farmers. I may state to you also that 92 per cent of the membership of that organization is made up of men who are not less than three-generation Americans. There was a reference made here this morning about my being an oriental, or something of that kind. I was born Armenian through unavoidable circumstances, but I became an American citizen through choice. Also, the gentleman who made that remark knows that I was wearing the uniform of the United States Air Service as early as April, 1917, and the manufacturers whom he represents took full advantage of my absence from business in dealing with our farmers.

Senator WATSON. There was nothing said this morning by way of a slur or implication.

Mr. ARAM. I did not quite like it. It was taking unfair advantage.

Senator WATSON. I am sure that Mr. Parker said that only to show that you had some knowledge of that situation. Then, afterward, Senator Shortridge referred to the fact that you had been born in Armenia. That is nothing against you.

Mr. ARAM. The Fordney bill puts a tariff of $1 per pound on the Turkish type of tobacco. We ask no change in the tariff as it stands in the Fordney bill, although we asked for a higher rate from the House committee. The term "Turkish" does not imply tobacco coming from any particular country. The term "Turkish" is simply a popular name for one branch of the tobacco family. The scientific term for that particular branch is nicotinum rusticum. If we should say nicotinum rusticum, it would mean the Turkish type of tobacco, no matter where it is grown. There has been an effort to represent that there is a discrimination against one country or several countries. This type of tobacco is now grown in over 20 different countries.

First of all, we asked the Ways and Means Committee of the House for a separate classification of this type of tobacco. Heretofore it

has been classified as filler tobacco, just as a number of other different types are classed under the filler classification. The reason was that it is impossible to put a just tariff on one of these filler tobaccos without doing an injustice to the other tobaccos included in that term "filler tobacco."

I wish to call the attention of the committee to the difference of that Turkish tobacco and other types of tobacco carried under that term. It can be seen very easily from the physical characteristics of these various tobaccos that they can not all survive under the same classification. The 35-cent rate on filler tobacco was put on long before we knew anything about Turkish tobacco and long before we had any such tobacco grown here.

The yield of this tobacco [indicating] is from 800 to 1,500 pounds per acre, I understand. If we get 400 pounds of cured tobacco from the Turkish tobacco, we feel very happy about it. The method of curing and preparing for market this particular kind of tobacco is different from that used in connection with these tobaccos here [indicating], and involves much heavier expense.

Senator DILLINGHAM. Do these samples that you have here represent the actual size of the leaves?

Mr. ARAM. Yes, sir. This tobacco, as I understand it, is harvested in the South by cutting the entire stalk off the ground. This tobacco is primed off, leaf by leaf, as each ripens.

Senator SIMMONS. You are mistaken about that. There are sections in the South in which it is cured in the way you indicate. They cut the stalk off and cure the tobacco on the stalk. In North Carolina, where I live, we invariably pull the leaves off and cure the leaves.

Mr. ARAM. I am not acquainted, Senator, with the tobacco situation in the South. However, there is no comparison either between the yield per acre and the method of manipulation and expense between the two tobaccos. The period of harvesting the leaves off the stalk of the Turkish tobacco extends from one month to five weeks, and it must be done before sunrise. That is one of the reasons that a separate classification became necessary for that particular type of tobacco, in order to separate it from the filler tobaccos. Our tobacco has much smaller yield per acre and requires heavier expense and careful work in manipulation. I have gone into that very thoroughly in our brief, or memorandum as I have called it, which we will submit to the committee for the records.

Senator SIMMONS. What is the comparative thickness of that small Turkish tobacco and the Virginia type?

Mr. ARAM. This [indicating] is a little thicker. There is more body to it.

Senator MCLEAN. Does that represent the average?

Mr. ARAM. This represents the average high-grade tobacco of its type. There are larger leaves, but they are not considered a good grade of tobacco.

Senator MCLEAN. That is just the point. Are there larger leaves than those on every plant? In other words, have you selected these small leaves from a plant that had larger leaves on it?

Mr. ARAM. The bottom leaves are somewhat larger, but they are not as desirable. They bring a lower market price than these leaves here [indicating] do.

Senator SIMMONS. Now, when you are estimating the number of pounds that you raise per acre do you include only the small leaves that you say are of the higher type, or do you include both the small leaves and the larger leaves?

Mr. ARAM. The entire yield; that is, all that is harvested off the stalk.

Senator SIMMONS. What is the difference between the price of the higher grade small leaves and the price of the lower grade larger leaves?

Mr. ARAM. Well, that would be very difficult to say, because of the difference of types. The manufacturers could answer that better than I can.

Senator SIMMONS. You make it and sell it, do you not?

Mr. ARAM. Yes, sir.

Senator SIMMONS. Then you ought to know.

Mr. ARAM. I would say there is 100 per cent difference between the price of the bottom leaves, the middle, and the top leaves. That has been our experience.

Senator SIMMONS. Do you get from those small leaves more than the average price of Virginia-grown tobacco?

Mr. ARAM. Much higher.

Senator SIMMONS. What did you get for it?

Mr. ARAM. We have sold it as high as $1.25 per pound, when we did get anything for it.

Senator SIMMONS. What do you mean by saying when the manufacturers give you anything for it?

Mr. ARAM. I mean by that that since 1919 we have not been able to sell a pound of tobacco. We have had to give it to the manufacturer at the manufacturer's price, and not at the fair value of the product.

Senator SIMMONS. What price did you have to give it to him for?

Mr. ARAM. We have not sold anything since 1919. Prior to that we have sold our tobacco at from 25 cents a pound to $1.25 per pound.

Senator LA FOLLETTE. That is since last year?

Mr. ARAM. We have not sold anything since and including the 1919 crop. It is in the warehouses.

Senator SIMMONS. Why?

Mr. ARAM. There are two reasons: The first is that if they purchase these tobaccos from us and give it a fair value, that is, cost plus a fair profit, they will be higher; they will have to pay us a higher price than they would pay for the imported leaf of the same type and grade. In the second place, the manufacturers do not want to encourage this industry in California because they feel that the California crop can not be controlled as the imported crop is controlled. They tried it and we would not stand for it. There is a tendency out in California to do business on a cooperative basis and to stand up for a fair profit. I have evidence of that. I will come to that a little later on.

Senator SIMMONS. You say you did not sell the 1920 crop at all?

Mr. ARAM. No, sir; nor the 1919 crop.

Senator LA FOLLETTE. Was it a good crop?

Mr. ARAM. Yes; it was a fair crop.

Senator DILLINGHAM. What did you get for the 1918 crop?

Mr. ARAM. It was according to the varieties. The highest was $1.25.

Senator LA FOLLETTE. Have the manufacturers given any reason for refusing to buy the crops of 1920 and 1921?

Mr. ARAM. They have not stated any clear, definite reason, but, Senator La Follette, we have dealt with these people for 16 years now, and from our own experience we can read between the lines. We have had a thorough investigation made; we have had a very thorough experience with the manufacturers, and we know the reasons. They have made them known to us. They do not mince words with us and tell us where we get off, but they do not speak for publicity. And when they come down before Congress they speak very nice and assume the rôle of the much-abused business man. The reason seems to be that they do not wish to encourage the industry in the United States because it can not be controlled by the big five as the imported leaf is controlled. They are not going to encourage the industry if they can help it.

Senator SIMMONS. Tobacco sold at a high price in 1919, did it not?

Mr. ARAM. Yes. They offered——

Senator SIMMONS. The Virginia tobacco sold at good prices.

Mr. ARAM. At the same time the highest offer we could get was 40 cents a pound. That represented one-third of the cost of production. We could not sell it. Besides, they never make a firm offer. They always leave a loophole for themselves. When we deliver the tobacco they take some at the agreed price and reject the rest, giving us the alternative of accepting a much lower price. They do this because we can not say, "Well, we don't sell; we will sell it to the next fellow," because there is no next fellow.

Senator WATSON. Could they buy the Turkish tobacco during the war?

Mr. ARAM. Some.

Senator WATSON. When they could not get it except in small quantities, did they make any offers?

Mr. ARAM. They bought it all. In addition they went to China and Korea, operated their own plantations and raised Turkish tobacco there and kept themselves supplied until the armistice.

Senator WATSON. How much did you raise?

Mr. ARAM. I have the figures in my brief.

Senator WATSON. How much did they pay for it?

Mr. ARAM. We sold it for whatever they offered for it. That was, as I said, from 25 cents to $1.25 per pound.

Senator WATSON. That was at this particular time; that is, while we were in the war?

Mr. ARAM. Yes.

Senator DILLINGHAM. Can you state what proportion you sold for 25 cents and what proportion you sold for $1.25?

Mr. ARAM. I haven't the figures here, but I can prepare a statement and submit it to the committee, if it is desired.

There was a statement made this morning which would make it appear that the California people wanted a tariff on an industry that they hope to establish rather than on an industry already established and entitled to protection. I want to say that that industry is already established. Since the speaker representing the American Tobacco Co. referred to it, I would like to read from a pamphlet

hich deals with this particular point. It was issued by the American obacco Co. in 1909. The statements in the pamphlet refer to urkish-type tobacco exclusively:

The growing of tobacco is a common-sense proposition with no mystery of any rt attached. * * * The growing of tobacco in California is well on its way. ı fact it may now be regarded as an established industry.

That was in 1909, when we had a production of 37,000 pounds: it was an industry then, why isn't it an established industry in 1919, hen the production was 1,525,000 pounds?

This pamphlet was issued in 1909 by the Exeter Tobacco Ranch, perated by the American Tobacco Co. That is the experiment ation that they referred to this morning.

I have letters also from manufacturers stating that the reason that hey can not give us the price we think fair is that they do not want give us a higher price when they can get that same tobacco on the ther side at a lesser price. They do not say anything about quality.

I have a letter from Mr. James M. Dixon, chairman of the board of he Tobacco Products Corporation, who is now present. It is dated une 25, 1918, in which he says:

I can only repeat what I have told you so many times—the offer that I originally ade you I do not consider is in any way binding. The tobacco market for Greek obacco is at the present time on the decline, and I may be obliged to change my offer t any time without notice to you. The matter is certainly not of sufficient interest or me to come out to Fresno, when I know that the price which sellers are asking is nore than I will pay.

Senator McCUMBER. Is this California tobacco used as a substitute for the Turkish tobacco?

Mr. ARAM. Of course, Senator McCumber, they do not state what hey use it for, but I have letters from the manufacturers. One letter s written by a large manufacturer of the highest grade of Turkish cigarettes on the market, and the inference is that the manufacturer was making an inquiry for his own use rather than for that of some one else. However, they do not inform us what they use it for and what they do with it. The manufacturers are a very close-mouthed bunch. I suppose they have to be. But they have repeatedly told me that they don't care where the tobacco is grown, but if we intend to grow in this country we will have to give it to them for the same price as the imported.

Senator SIMMONS. Do you know what they paid for the Turkish tobacco in 1919?

Mr. ARAM. We tried to get that information from the Department of Commerce through the assistance of the State Department. I have reports submitted by the various consular representatives in the various countries where these tobaccos come from. The statement was made this morning that these tobaccos cost, on the other side, 80 to 90 cents. I will say that in my negotiations with the manufacturers they stated to me that they did not see why they should buy California tobacco when they could get it from the other side, laid in bond, for from 15 to 30 cents.

Senator SIMMONS. 15 to 30 cents?

Mr. ARAM. Yes, sir.

Senator McCUMBER. That is export?

Mr. ARAM. Imported from levantine countries.

Senator McCUMBER. Imported for the purpose of making cigarettes.

Mr. ARAM. Imported for the purpose of manufacturing in thi country and selling it in this country.

Senator MCCUMBER. At what price did you say?

Mr. ARAM. 15 to 30 cents.

Senator LA FOLLETTE. That is the price on the other side?

Mr. ARAM. In other words, a man who has tobacco in the warehou in New York City is willing to sell for that price.

Senator MCCUMBER. After paying the duty?

Mr. ARAM. Before paying the duty. I have here a letter from man who has 500,000 pounds of the Turkish imported tobacco, and is offering it, in this letter, for 35 cents a pound in New York City bond. It is dated August 9, 1921, from Mr. M. H. Mathewsian, N York City, as follows:

> MY DEAR MR. ARAM: Under separate cover I am mailing you just a few samp our tobacco. This tobacco came to New York on the steamship *Chesterville* and have 2,500 bales, approximately 500,000 pounds. We will sell it at 35 cents a po ex warehouse New York. Should you be interested in this tobacco I will be plea to give you inspection permit. Hoping to hear from you favorably, etc.

The question was raised this morning, Why is it that this indust has survived for 16 years and has increased in production and g along so well and now needs a tariff? I would like to give you th history of this industry in the State of California. This industry wa started back in 1906 by a few men who had come to this countr from Macedonia and Turkey, where they had been tobacco growe themselves. They took up the industry in San Juan Valley an made it a sort of side issue. Some of them had 1 or 2 acres of lan that were not used for anything else and they put those acres tobacco. That was done on the side. When the time came to se the tobacco they sold it for whatever the manufacturers offere No attempt was made to keep account of its cost. These me reasoned something like this, "Last year we had $5,000 for ou olives, this year we have $5,000 for our olives and have $300 or $40 for our tobacco besides." They considered the tobacco money a velvet. They never figured, however, on the cost of raising th tobacco, because that was done in between times. That conditio continued until about the year 1911. By 1911 it became generall known in California that this type of tobacco did best in certai soils which up to that time we did not know what to do with. I required light, loose soil; soil on the hillside. Now, it was at th time that good American farmers went into tobacco growing excl sively. Of course, they kept books. When the crop came and wa harvested, they discovered it did not bring within one-half the co of production. The industry then began to decline. Then the wa came along. Under war conditions we sold it as best we could Production went on. As soon as the war stopped the imports from the other side came in and the industry dropped down.

I must state that if the coming tariff bill does not carry a prote tive duty on this tobacco, we are through with it. We can not d anything with it. I have a letter here that shows the situation w face now:

FRESNO, CALIF., *March 3, 1921.*

'RED W. LINKS,
State Agricultural Society, Sacramento, Calif.

DEAR SIR: We have your favor of February 28, and note your desire to have an rticle dealing with growing tobacco in this section.

Tobacco growing in the San Joaquin Valley has been practically abandoned because f unfavorable prices and the inability to market the crop grown two or three years go.

Any report that would be made would therefore be rather adverse, and we hesitate o compile it, unless you believe it should be included in the statistical report.

Yours, very truly,

FRESNO COUNTY CHAMBER OF COMMERCE,
GUY E. LEONARD, *Director of Publicity.*

The tariff in the Fordney bill was computed on the basis of the ost of production here and the cost of production on the other side. t is less than what we asked for and we believe we should have, but e are willing to go to work on what the Fordney bill gives us. The ost of production over on the other side we secured, after careful xamination, and through the consular reports, and so on. We are eady to submit to the committee also detailed cost of production, oing into every item in connection with this tobacco. It is in our rief.

I should also answer the statement of the gentleman who spoke this morning, and who made it appear that the Ways and Means Committee levied a tariff on a product with no other showing than a written brief. That is not true, and the statement is not fair to the House committee. I could not be present during the public hearings before the Ways and Means Committee. I arrived a little too late. I put in our brief, which they referred to, and then the subcommittee on agriculture called me in and made me go over every statement and prove everything that was contended for. In fact, it was very thorough, and from my experience with the committee I wondered if every member of the committee came from the State of Missouri. We had to go very thoroughly into every statement and prove every statement that we made and give them all the facts in detail.

There is another question, and that is the question of quality. The gentleman who spoke here this morning said that this was not Turkish tobacco. Well, it is not Turkish tobacco; that is, it is not grown in Turkey. It is what is known as nicotinum rusticum. Turkish tobacco is not grown in Turkey alone; it is grown in Macedonia, Russia, Austria, Rumania, Greece, Palestine, Syria, Bulgaria, Italy, South Africa, United States, and in a number of other countries. In the Union of South Africa they began to cultivate this tobacco about 10 years ago. Now they have demonstration farms and an assistant to the director of agriculture in charge of tobacco exclusively. I will pass to the committee an advertisement in a London paper by the commissioner of the Union of South Africa urging Britishers to migrate to the Cape Colony and engage in farming Turkish tobacco. In Italy also they have been producing this tobacco for several years, and the Italian Director of Agriculture recently announced that the cultivation of Macedonian-type tobaccos would be further extended, and that it was the intention of the Italian Government to be independent of imports from the levantine countries. The question of quality in connection with our tobaccos was never raised until after we organized our cooperative association and prepared to ask Congress for adequate protection. It was then that the manufacturers began

to carry on a systematic propaganda against the quality of thi tobacco. Here is a news item printed in the issue of August 29, 1918 of Tobacco, a trade journal published for the tobacco industry:

SUCCESS IN CALIFORNIA.

E. Constantine, a tobacco broker of San Francisco, visited the Chiflakos Bros plantation near Esparto, Yolo County, Calif., recently for the purpose of investigatin the varieties and quality of the tobacco grown by Chiflakos Bros. After making thorough examination Constantine declared the product to be of the very highe quality, and closed a contract for the purchase of the crop.

Constantine was enthusiastic over the possibilities of tobacco raising in the Yol section, and is endeavoring to sign a contract with the Chiflakos Bros. for the entir crop of 1,000 acres for next year. It is not known if the deal was closed. but it is prac tically assured that the Esparto growers will have in the neighborhood of 1,000 acre in tobacco in 1919.

Senator REED. How much ground did you say is used in Californi in raising this Turkish tobacco?

Mr. ARAM. Three thousand acres in 1919.

Senator REED. What is the total acreage of California?

Mr. ARAM. I do not know, sir. I do not think I can answer that

Senator McCUMBER. Do you mean tillable land?

Senator REED. Yes, tillable land.

Mr. ARAM. I do not know. But in California we can raise th entire world consumption of this tobacco without using one acre o land that is fit for other crops.

Senator REED. How many acres in the United States are employe in the tobacco business generally?

Mr. ARAM. I do not know that, sir.

Mr. DUSHKIND. One million.

Senator REED. How many people own these 3,000 acres of ground

Mr. ARAM. We have a membership now of 300 farmers.

Senator REED. Three hundred farmers?

Mr. ARAM. Yes, sir.

Senator REED. Then there are 300 farmers who, you say, ar members?

Mr. ARAM. Yes.

Senator REED. You mean 300 farmers who are engaged in th business of raising Turkish tobacco?

Mr. ARAM. No, sir; there are more than that. My association i comprised of 300 farmers. The reason that the other fellows are ou is this: When American Tobacco Co. came out there they lease ground in the San Juan Valley. Naturally the thing centered aroun San Joaquin Valley——

Senator REED. That is probably very interesting, but I want t follow the line of questioning upon which I started.

Mr. ARAM. That is just what I was coming to.

Senator REED. How many people are there outside of your associa tion?

Mr. ARAM. I have not the exact figures.

Senator REED. Well, approximately.

Mr. ARAM. Well, I should say about 100.

Senator REED. So thatt here are about 400 men engaged in raisin the Turkish tobacco in California?

Mr. ARAM. Yes; that is, 400 men who own the land and cultivat it. There are more than that engaged in the industry.

enator REED. I am talking about the landowners.
Ir. ARAM. Yes.
enator REED. When you speak of others being engaged in the ustry, do you mean mere employees who are engaged in picking acco and storing it?
Ir. ARAM. Such men as are employed in the industry.
enator REED. How many men, all told, would you say are en- ed in cultivating the 3,000 acres of ground to which you referred? ean men employed in picking the tobacco, storing it in warehouses, l carrying it to market.
Mr. ARAM. I do not think I could give you a very accurate answer that question.
Senator REED. Approximately.
Mr. ARAM. I do not know.
Senator REED. It does not average 10 acres apiece, does it? I sup- se one man could come pretty near taking care of an acre.
Mr. ARAM. He can not. In the busy season it would take about men to an acre part of the time. At other times one man could ndle it.
Senator REED. Would you say 6,000 people, taking the average ring the entire year?
Mr. ARAM. It would take more than that. It would be nearer 00. Nine thousand would be a fair number employed; that is, m time to time.
Senator REED. About 9,000?
Mr. ARAM. Yes.
Senator REED. During the entire year?
Mr. ARAM. Yes, sir; employed from time to time.
Senator SIMMONS. Working 3,000 acres?
Mr. ARAM. Of course that is not the entire time.
Senator REED. I am asking you for the entire year.
Mr. ARAM. That would be the average.
Senator REED. How much employment would be furnished con- antly during the year on that average?
Mr. ARAM. That would be the average number employed.
Senator REED. That would be the average. All right; we will say 000.
Mr. ARAM. Yes.
Senator REED. How much Turkish tobacco do you raise—that is, hat you call Turkish tobacco?
Mr. ARAM. I, personally?
Senator REED. Oh, no. I mean all of these people.
Mr. ARAM. In 1919 we raised over one million and a half pounds.
Senator REED. One million five hundred thousand pounds?
Mr. ARAM. Yes, sir.
Senator SMOOT. What did you raise this last year?
Mr. ARAM. I think about twenty or thirty thousand pounds.
Senator SMOOT. How much?
Mr. ARAM. About twenty or thirty thousand pounds, because we e not sold anything, including the 1919 crop.
Senator SMOOT. What was the 1920 crop?
Mr. ARAM. Seven hundred thousand.
Senator REED. Seven hundred thousand pounds for 1920?
Mr. ARAM. Yes, sir.

Senator REED. That was last year?

Mr. ARAM. Yes.

Senator REED. What is this tobacco worth per pound?

Mr. ARAM. It is not worth anything now. The manufacturers it is not, and only four or five buyers can buy. They say they do want it. It is not worth anything.

Senator REED. I do not want to take advantage of you, and must not take advantage of me. You say that it is not worth a thing. You mean by that there is no market. What is the mar for it? It surely sells for something.

Mr. ARAM. I suppose it would sell for something if any ma facturer came and made an offer for it, but we have no offers for i

Senator REED. It must not be of much account then.

Mr. ARAM. It is not of much account to us unless it is sold.

Senator REED. Why isn't it of any account?

Mr. ARAM. Because the manufacturer does not buy it.

Senator REED. Why does he not wish to buy it?

Mr. ARAM. Because he does not wish to see the industry contin in the United States, but principally because the American prod costs more than the foreign product.

Senator REED. The American manufacturer does not want to good Turkish tobacco raised in this country, and so he will not bu at all.

Mr. ARAM. That is exactly the case.

Senator REED. How are you going to make him buy it?

Mr. ARAM. We are not going to make him buy it.

Senator REED. Then how are you going to handle it?

Mr. ARAM. All we want is a fighting chance so that the cost of p duction on the other side and on this side will be equalized.

Senator REED. What is the difference in the cost of productio these 700,000 pounds? I have asked you the price. I believe said you could not tell the price.

Mr. ARAM. That tobacco costs, on the average, $1.25 per poun some was more and some was less.

Senator REED. The average was $1.25?

Mr. ARAM. Yes. Our brief gives the exact figures.

Senator REED. What does the Turkish tobacco shipped in he for?

Mr. ARAM. There is no open market in the United States fo tobacco. The manufacturers maintain their own warehouses there and do their own buying and importing through a subsi company. Our consular reports show that the highest cost t foreign farmer is 50 cents.

Senator REED. Fifty cents.

Mr. ARAM. That is the highest, not the average.

Senator REED. What is the average?

Mr. ARAM. I do not know. They have not given that to us.

Senator REED. Can you in any way approximate it?

Mr. ARAM. I have no way of doing that, Senator. I have for my information on the Department of Commerce.

Senator REED. You say 50 cents. Then it costs two and times as much to raise this tobacco here as it does to raise it and ship it to the United States, pay the tariff, and market it; the situation, is it?

Mr. ARAM. Fifty cents is the cost to the farmer over there before comes here.

Senator REED. How much Turkish tobacco is consumed in the nited States?

Mr. ARAM. Our importation amounts to—it varies from 25,000,000 35,000,000 pounds.

Senator REED. Twenty-five million.

Mr. ARAM. Yes.

Senator REED. To 35,000,000?

Mr. ARAM. Yes.

Senator REED. Then 30,000,000 would be a fair average.

Mr. ARAM. I presume so.

Senator REED. We will take 30,000,000 for easy figuring. It mes in at 50 cents. You say it costs $1.25 to raise this tobacco. u would want some profit on that, naturally. What would you y would be a fair selling price?

Mr. ARAM. I suppose we would be satisfied with 10, 15, or 20 per nt. It all depends on market conditions and crop conditions.

Senator REED. You would want to get at least $1.50 a pound, uld you not?

Mr. ARAM. We would have to get a fair profit.

Senator REED. Very well; we will take $1.50. Now, you want us to ise the price on the foreign tobacco from 50 cents on the 30,000,000 unds, so that instead of selling at 50 cents, the highest price at hich it would sell, it would be $1.50, on the average. That is the ice at which it would have to sell.

Mr. ARAM. That is not quite right, Senator; 50 cents is not.

Senator REED. So that if you import 30,000,000 pounds of this bacco, that would mean $30,000,000 that would have to be paid by e American consumer in order that you gentlemen might realize 5 cents a pound profit on 700,000 pounds, or $175,000. You want s to tax the American people $30,000,000 as a minimum in order at you may realize $175,000.

Mr. ARAM. That is not a fair statement, for this reason.

Senator REED. I think it is absolutely fair.

Mr. ARAM. I stated that the cost of production on the other side as a maximum of 50 cents a pound. There is no tobacco brought nto this country and sold at such a figure, even before putting the riff on it, which is now 35 cents a pound.

Senator REED. It is less than 50?

Mr. ARAM. Sometimes it is less than 50, at the point of production, ut only two or three manufacturers can get it at that price.

Senator REED. You said that was the highest.

Mr. ARAM. That is the highest cost of production over there.

Senator REED. I asked you for the cost of production abroad plus hipping and plus tariff, and you said it was the highest price.

Mr. ARAM. I have no information on shipping. I have information nly from the Department of Commerce as to the actual cost of production. That is the highest figure. Some is less than that when the obacco comes to this country and before the duty of 35 cents is paid, ut when it goes to the independent manufacturer he can not get it at uch a price.

Senator REED. You certainly misunderstood my question, or I ailed to ask it clearly.

Mr. ARAM. I am trying to understand it.

Senator REED. The price of this tobacco after it has been shippe to this country and after it has been marketed is 50 cents, as I unde stood you to say. The market price, I understood you to say, w 50 cents.

Mr. ARAM. That is not my statement. I said the cost of produ tion on the other side was 50 cents for the highest figure. That is t actual cost of production to the farmer on the other side. I have n way of knowing what the transportation rates and the insuran charges, etc., are, because we are not engaged in the marketing or im porting of foreign tobacco.

Senator REED. Then you did not understand my question.

Senator SMOOT. Did I understand you to say that many of t independents could not buy the Turkish tobacco?

Mr. ARAM. Not on the same terms as two or three manufacturers d

Senator SMOOT. What difference does it make? Do you mean th there is a difference in the price or in the terms?

Mr. ARAM. A difference in the price. It costs much more for t independent manufacturer to buy the Turkish tobacco than it do two or three of the large manufacturers.

Senator SMOOT. Is your Turkish tobacco just as good as t Turkish tobacco that they import?

Mr. ARAM. It is, sir.

Senator SMOOT. Why don't they come to you to buy it, then?

Mr. ARAM. They could not buy more than a bale a month.

Senator SMOOT. Your independent manufacturers amount nothing in the trade, then, do they?

Mr. ARAM. There are none.

Senator REED. Then why do you talk about independent manufa turers and large manufacturers?

Mr. ARAM. That is one reason why they are not there. The supp is controlled and when they want it they have to pay heavy for When I spoke of independent manufacturers I meant that we ha a great many men who make cigarettes by hand for private trade an for clubs, etc. They pay the highest prices. But their capacity very small. We can not deliver one bale of tobacco to a manufa turer and support our industry.

Senator SMOOT. No more than they get from Turkey?

Mr. ARAM. They don't get from Turkey. They get it in New Yo from the importing subsidiary companies of the big five.

Senator REED. No more than they get from one of their factorie

Mr. ARAM. I don't know about that.

Senator MCLEAN. What is the tariff under the old law?

Mr. ARAM. It has been 35 cents, classed as filler tobacco.

Senator SMOOT. That is unstemmed?

Mr. ARAM. Unstemmed.

Senator MCLEAN. That represents the duty up to the enactme of the emergency tariff?

Mr. ARAM. We are not in the emergency tariff. It is in the pe manent tariff. We wish we were in the emergency. Our farmers a broke, including myself. We had to sell our house last summ because all we have is in tobacco and I had to come here to get th tariff. If the permanent tariff doesn't pass before long, there will

good many farmers of my section, not only the tobacco growers, it others who will have to sell their houses or whatever they can to re on. We have been at our wits' end to know how to raise money pay the warehouse charges that have been coming due from onth to month on the association tobacco. I went to the War inance Corporation and arranged for a loan. They were very nice me and wanted to help. According to the war finance law we id to get a valuation on our tobacco in New York warehouses and a ew York banker undertook to get that valuation. This was only ro months ago. I was sitting in that banker's office when he called the big manufacturers right in my presence and asked them as the market value of our tobacco. He was informed that it was not orth more than 15 cents and yet the manufacturer who made that atement was at that very time in negotiations with me trying to t our tobacco for 40 cents, but they would not make the offer in riting. They knew we were hard pressed by a small bank in alifornia and they also knew that it was only a matter of time that ley could buy that tobacco at their own price. We could not get le valuation because there are only four or five companies in the nited States who can buy tobacco in any quantities. That is where le farmers stand. I have a letter here from a bank in California lat has loaned some money to the members of our association, and le loan has been due for two years. This bank is a good friend of the sociation, but they have gone as far as they can because all their oney is tied up in agricultural products that is not selling. Here is a tter and I will let it tell its own story:

BANK OF ESPARTO,
Esparto, Calif., July 7, 1921.

Ir. ALFRED ARAM,
Care of Congressman Curry, Washington, D. C.

DEAR SIR: I hate to write hard-luck stories, but I am going to beg of you to leave othing undone to give us the relief that we are praying for, and that we so sorely eed. It is a wonder that we keep open. If we could get the tobacco money, we ould again find that life was worth living.

It is impossible to predict what will come to us if we have to wait much longer for he relief that the sale of the tobacco will bring.

Very truly, yours,

M. O. WYATT, *President.*

As to how farmers are situated now I am going to insert another etter that brings the situation right up to date. That also tells the tory without any further comment.

O'GORMAN, BATTLE & VANDIVER,
New York City, December 2, 1921.

LFRED ARAM, Esq.,
Hotel Ashton, New York City.

DEAR MR. ARAM: I have received word from Mr. Quinn to-day that he has received letter from the Fresno Bank in answer to his letter in which they refuse to be guided n his suggestions and recommendations in the matter but direct him to enter judgment, issue execution to the sheriff, and have the tobacco levied upon and sold in he regular way. Under these circumstances of course Mr. Quinn is powerless to do nything but to follow out the directions which he has received.

I do not see anything that we can do under the circumstances, but I think you had etter come to see me as soon as possible, and we will talk the matter over.

Very truly, yours,

ADDISON A. VAN TINE.

The money we owe to this bank is $15,000, and the tobacco that they have ordered attached has cost our farmers over $200,000 to grow, and we can't raise the $15,000 to release our tobacco. I have gone into every bank that didn't have a lock on their door, but I found out that to borrow money from the banks now on agricultural products is impossible.

Senator McLEAN. The filler tariff is 35 cents?

Mr. ARAM. That is the wrapper tobacco. We have nothing to do with cigar tobacco. This is strictly cigarette tobacco.

Senator McLEAN. But you have been doing business under the rate of 35 cents a pound for the imported tobacco up to the present time, have you not?

Mr. ARAM. We are under that now.

Senator McLEAN. Yes.

Mr. ARAM. Yes.

Senator McLEAN. Before I go further I will ask you this: Has the price of the foreign product varied very much in the last year?

Mr. ARAM. Do you mean the leaf tobacco?

Senator McLEAN. I mean the tobacco used for cigarettes. What has been the effect of the war on that tobacco?

Mr. ARAM. During the war the price was higher, but the manufacturers could not get much because of the absence of ships on the high seas. They grew the tobacco in China and it cost them very little.

Senator McLEAN. And since the war how has it been?

Mr. ARAM. It has been very low.

Senator McLEAN. And in the meantime the price of cigarettes has doubled?

Mr. ARAM. I suppose so.

Senator McLEAN. So the matter of the tariff has not affected the consumer very much in this country?

Mr. ARAM. No. It never has on any kind of smokes. If there is any saving the manufacturer keeps it. If there is any increase he passes it and more on to the consumer.

Senator McLEAN. The dealers have gotten their production at a less price and they have doubled the price of the cigarettes.

Senator REED. Does the chart which you have there show that cigarette prices have been doubled?

Mr. ARAM. I do not think they have been doubled.

Senator REED. They have been increased?

Mr. ARAM. The price has been increased considerably.

Senator SMOOT. Have they been increased in price since the increase in the revenue?

Mr. ARAM. My understanding is that they have been increased. Yes; I believe the price is nearly double on some cigarettes.

Senator SMOOT. Since the increase of the revenue tax?

Senator McLEAN. I do not want to make any misstatement. Perhaps I exaggerated when I said the price had doubled. I do not know anything about that, but I assume that the price has increased with the increase in the price of other things.

Senator SIMMONS. I do not think it has kept abreast with the increase in the price of cigars.

Mr. PARKER. Some brands of cigarettes have increased in price. They increased in price when the tax came along. There was an

crease in price for the packages of 20, but there has not been an crease since 1920, and the present tendency is downward. They ave recently reduced the price.

Senator McLEAN. You stated this morning, I think, that the price the cigarette filled with Turkish tobacco was 2 or 3 cents apiece, I understood you.

Mr. PARKER. That is the Pall Mall and the high-grade Egyptian eities.

Senator McLEAN. Yes.

Mr. PARKER. The price of the Pall Mall has not been increased 10 years. It was 25 cents to the consumer for a package of 10. some stores they sell for 30 cents for a package of 10 but, generally eaking, they sell for 25 cents.

Senator REED. How much increase was made in the tax?

Mr. PARKER. From $1.25 to $3.

Senator McLEAN. That is 3 mills to the cigarette.

Mr. PARKER. But there was no increase made in that price.

Senator McLEAN. The price of the cigarette is, at the present time, om 2.5 to 3 cents apiece?

Mr. PARKER. Yes; and always has been.

Senator REED. Let us take the Camel, the real cigarette. What es that cost?

Mr. PARKER. Twenty for 10 cents. The tax was increased from 1.25 to $3. The Virginia and the burley tobaccos all went up. t one time they reached a point of 20 cents to the consumer.

The manufacturers of Camels have comparatively recently made ductions.

With the lowering of the cost of tobacco, the American Tobacco o. got out 20 for 15 cents. The Lorillard Tobacco Co. has gotten ut a brand that goes to the consumer for 20 for 15 cents. The adance reached its peak in 1918 and during 1921 it has been on the ecline.

Senator REED. What have you to say about these people in Caliornia who say that the large dealers will not buy that California obacco?

Mr. PARKER. There is no justification for it. It may be true that rge manufacturers having an organization in Turkey can save omething on their tobacco. But these organizations are separate ompeting organizations. The American Tobacco Co. buys some rough its own organization and picks up some through importers, ut there is no suggestion of any condition that I know of where ny manufacturer has any motive or purpose except to get the raw aterial that will suit his brand as well as he can get it.

Mr. ARAM. It was stated this morning that the manufacturers ried to raise this tobacco in different States and they became conin ed that the tobacco could not be grown in California. The ct that they went to Colorado to raise it as the manufacturers' epresentative stated this morning indictates that they know nothing bout growing tobacco. High humidity, even temperature, and fog t night are prime essentials for the growing of this tobacco, and Colorado boasts these characteristics of climate it has escaped ur attention. The manufacturers went out there and encouraged he industry as long as it was grown as a side issue and the farmers, s I said awhile ago were willing to sell it for whatever they were offered

for it. The policy of the manufacturers changed and they then opposed the progress of this industry in California, as Mr. Parker stated—and he was correct—in about 1910. Now that change was brought about in this way: In about 1909 or 1910 the United States Government began to take a lively interest in the doings of the manufacturers, and it was decided that with the establishment of this industry in California it would not be quite to their liking that there should be a source of the raw product which would be open to anyone and where anyone could get it on equal terms. It would never do to give the small manufacturer a chance. As to quality, I don't believe there has ever been any industry in the United States, be it agricultural or industrial, producing a competing article with a foreign article but what the interests making money on imports have come down here to Congress and raised a question of quality. A few years ago they said it was impossible to grow long staple cotton in Arizona. Well, they are not only growing long staple cotton in Arizona, but they are growing a better cotton than the imported, and it may interest this committee that the last United States Census report shows that the State of Arizona is showing a greater percentage of increase in population than any other State in the Union. If you go down the Salt River Valley of Arizona and see the transformation they have worked out of the dry desert you will easily understand how this increase of population came about. If it had been left to the gentlemen interested in cheap imported cotton, Salt River Valley would still be a desert. In 1904 the United States Department of Agriculture published a report based on the Paris Exposition of tobacco.

Mr. Marcus Floyd, who is now engaged in the production of wrapper tobacco, represented the United States Department of Agriculture at that exposition. In that report the department urged that the United States should ultimately become independent of all foreign tobaccos and that there was no reason whatsoever why we should not go to work and produce all the different kinds of tobacco that are grown anywhere in the world. Did the Department of Agriculture or the Congress of the United States suppose for a moment that we could grow these various kinds of tobaccos without a protective tariff? We have gone to work and produced this so-called "Turkish" tobacco. We have an industry that must be protected. The manufacturers come along and oppose the tariff that is already written in the bill. What have the manufacturers ever done to promote any branch of the tobacco industry? What have they done for the tobacco industry in the South? What have they done for the consumers, except to exploit them and charge them all they can, giving as little as they can? Gentlemen, there is nothing to this talk about quality. If there is any such question in the minds of the members of this committee, the California farmers will submit their tobacco to any fair test that the committee may suggest.

It was said awhile ago that on these 700,000 pounds of tobacco we want to raise a tax of $30,000,000 or so on the American public, although the Senator raising the question misunderstood my statement on the cost of production in the Levant and followed an erroneous method of computing. I wish to state this, that we are not trying to raise the taxes on the public. We want adequate tariff protection and we can raise all the tobacco that the United States can

consume of that type. As to raising the taxes on the smoker, there is about 10 per cent of Turkish tobacco in the average blended cigarette. We know that. If there is more than 10 per cent, there is no import figure shown for the amount needed.

If we distribute this $1 per pound on the amount of tobacco used in the average blended cigarette, the increase, if it is to pass on to the consumer, would amount to thirty-two one-hundredths of a cent per package of 20 blended cigarettes. But, giving a protective tariff to this tobacco is not going to mean an increase to the consumer unless the manufacturer wishes it so. Tariff and taxes have no effect on the consumer provided there is competition in manufacturing and distribution. What the tobacco growers and the consumers of this country need is real competition among the manufacturers. There are three individuals in this country who are interested in the manufacture and distribution of tobacco products. They are known as the "tobacco triplets." If some day they should go on a vacation without leaving their forwarding address, the manufacturers and the distributing agencies of tobacco products in the United States would not know where to report to their chiefs.

We have made several investigations with the collaboration of several of our consuls in foreign countries.

In England the consumer buys a cigarette made entirely of Virginia tobacco which is shipped out of this country. The British manufacturer pays freight, insurance, and so on, and pays a very high duty, which is much higher than that in the United States, and yet the cigarette sells for practically the same price that the American consumer pays for it in this country. Competition in England keeps the price down in spite of very high taxes.

There has been considerable talk about taxes being high on the tobacco industry in the United States. On investigation we found that the American smoker is taxed less on his tobacco and gets less for his money than the people in any other civilized country where tobacco is not a Government monopoly, and as to the farmers who produce the tobacco, they are dependent on what the manufacturer may wish to pay them.

Here is a statement that appeared in the Wall Street Journal:

MANUFACTURERS ACCUMULATE CASH.

As a result of lower leaf prices, cigarette manufacturers are accumulating large quantities of cash. It is officially estimated that one of the big manufacturers purchased its supply of tobacco at something like $20,000,000 less than it cost in 1919. This figure exceeds the manufacturing profit of any cigarette concern last year and is nearly 45 per cent of the profits of the five most important manufacturers.

These $20,000,000 represent money that belonged to the farmers, money that the manufacturer should have paid and did not pay to the farmer. Did any of it pass on to the consumer?

If this increase in tariff is going to mean an increase to the consumer, how is it to be explained that in England, where the taxes are nearly 100 per cent higher than in the United States, the consumer pays practically the same price or less? With respect to some of the American brands which are manufactured and sold in this country and also manufactured and sold in England after paying the 100 per cent higher tariff, the Englishman pays 1 cent less per package of cigarettes than the man in this country.

Senator La Follette. On an American cigarette?

Mr. Aram. Cigarettes manufactured in England by the American tobacco companies, and same identical brand sold here and in England.

I have telegrams in my pocket from our consuls. I also got information on the various brands in question from the manufacturers themselves. For instance, on one brand of cigarettes, I went to the export manager of that particular cigarette and asked him what it sold for in England.

Senator Watson. What is the name?

Mr. Aram. Melachrino, but it holds true for Pall Mall and Philip Morris cigarettes, also, in spite of the fact that the manufacturer pays twice as much in taxes in England, the Englishman pays 1 cent less for his package of 10 of these cigarettes than we pay here.

Senator Reed. What is the ordinary Government revenue on cigarettes?

Mr. Aram. What kind of cigarettes?

Senator Reed. Take those cigarettes made in this country.

Mr. Aram. You mean on tobacco grown in this country?

Senator Reed. Yes.

Mr. Aram. $3 per thousand internal revenue.

Senator Reed. Then there is a stamp?

Mr. Aram. In addition to the $3 revenue there is an import duty if the cigarette is made of imported leaf, but on cigarettes made of American-grown tobacco $3 covers everything. The total Government tax in the United States on cigarettes made of all imported Turkish tobacco is $4.31 per thousand. In England the same cigarette pays a tax of over $7.35 per thousand.

Senator Reed. The import tax.

Mr. Aram. In England there is no tobacco produced and there is no internal revenue. All the tax is taken at the customs house.

Senator Reed. And they sell for less there?

Mr. Aram. For 1 cent less than in America. That is the manufacturer's statement to me.

Senator Reed. That is retail?

Mr. Aram. Yes, sir.

Senator Reed. Perhaps the merchant sells at a less profit?

Mr. Aram. I do not know what his profit is, but in the United States the manufacturers control the arteries of distribution also through large chain-store systems, and the manufacturers themselves tell me that the cost of distribution in the United States is less than in other countries. They have things just where they want in this country. As to comparative prices here and in England I have charts here which I will pass for the record. It shows a comparison of taxes on tobacco in the United States, Canada, and England.

It shows that cigarettes made of good Virginia tobacco retail in England at $10 per thousand after paying British taxes of $4.90 per thousand, while the same cigarette retails in this country for $10 per thousand, paying to the United States Government total taxes of $3 per thousand, in spite of the fact that the tobacco is grown at the very doorsteps of the American factories while the English manufacturers must pay ocean transportation, insurance, etc. It is also interesting that some of the cigarettes sold in England are manufactured by subsidiaries of American companies. There was some-

thing said this morning about this tariff on Turkish tobacco injuring the tobacco farmers of the South. It was attempted to show that the consumption of southern tobaccos depended on the use of Turkish tobacco to be blended in. It would be interesting to have the manufacturers show the exact percentage of the Turkish tobacco contained in some of the largest selling blended cigarettes. I have been a tobacco man all my life and I know that there is no cigarette more delightful and tasty than good ripe Virginia and burley cigarettes. The manufacturers put that kind of cigarette on the market in England and other countries, but in the United States they mix it with "57 varieties" of artificial flavoring. They have good reason for doing that—that is, good reasons that suit their purpose. That, also, will have to be looked into one of these days, but as to the interests of the southern tobacco growers it is nothing short of preposterous that the American manufacturers of cigarettes should undertake to speak for the tobacco farmer. What the tobacco growers—growers of any kind of tobacco—in this country need is real competition in manufacturing. The speaker for the manufacturers stated this morning that the marketing of so-called blended cigarettes started in about 1912. He was right. What brought that about? Did the American smoking public get up all of a sudden out of a clear sky and demand blended cigarettes? Both the smokers and the manufacturers seemed to be getting along very well with straight southern-tobacco cigarettes.

In examining any condition or question in connection with the tobacco industry in the United States anything that happened within the years of 1910 and 1912 bears looking into very closely. That was the time when the United States Government took a lively interest in the activities of these manufacturers, which culminated in a dissolution order of the United States Supreme Court in 1911. The manufacturers artificially forced the demand for the so-called blended cigarettes because they felt that if the Government of the United States continues its interest in the tobacco situation, the United States being the largest tobacco-producing country, manufacturing would soon become an open game. Then they started to concentrate and create a demand for the so-called blended cigarette. And since they control the importation of these Turkish tobaccos they felt that would give them some measure of protection against manufacturing competition. The manufacturer's opposition to this tariff on Turkish tobacco is explained by these facts.

Senator Reed. May I interrupt you now and ask you another question?

Mr. Aram. Yes.

Senator Reed. You said there were 9,000 people employed, on the average, in this industry?

Mr. Aram. Yes; in 1919.

Senator Reed. And they raised 700,000 pounds of tobacco last year?

Mr. Aram. Yes, sir; but the 700,000 production did not require 9,000 people. That was for 1919, when the production was over 1,500,000 pounds.

Senator Reed. Which you say cost you $1.25. That would be $874,000. How would you pay 9,000 men with $874,000?

Mr. Aram. How would I pay them?

Senator REED. Yes. How would you pay 9,000 men working at, say, $1 per day. That would not pay their wages at $1 per day.

Mr. ARAM. I do not know what these men received, but we did not have 9,000 men engaged in 1920. Our association is conducted in this way: Our farmers raise tobacco under the direction of the association as to the method of production. The tobacco is taken to the association's warehouses, and a man goes to New York to try to sell it as best he can, and they are paid pro rata on what they get. In the last three years they have not received anything.

Senator REED. I do not think they have that many men because it would not pay them.

Mr. ARAM. The cultivation of tobacco requires a great many men. But the 1920 production of 700,000 pounds did not require 9,000 people. That was for 1919, when we produced over 1,500,000 pounds, and most of these employees are part time only.

Senator REED. May I ask you another question?

Mr. ARAM. Yes.

Senator REED. You spoke of 3,000 acres of land. Where does that land lie?

Mr. ARAM. Do you mean the exact location?

Senator REED. Generally speaking. Is it scattered all over the State of California?

Mr. ARAM. Yes, sir.

Senator REED. Is it rich land?

Mr. ARAM. It is not. It is not grown on rich land.

Senator REED. It is poor land?

Mr. ARAM. Yes, sir.

Senator REED. Do you raise anything besides tobacco?

Mr. ARAM. We have not so far. The best land is the land which heretofore has been used for grazing; that is, rocky, sloping, loose soil. That is the reason the State of California has gone behind this thing and wants a tariff. It is because there is plenty of this land which can not be put to productive use except for this kind of tobacco. I have requests here from the chambers of commerce of 21 counties, farmers' organizations, and from other public organizations and several editorials from newspapers stating that California needs this industry because it puts to productive use the type of land that we can not make use of for anything else.

Senator REED. What is it worth?

Mr. ARAM. From $100 to $250 an acre—some is worth more and some less.

Senator REED. The land, then, is not good to do anything else with?

Mr. ARAM. It is not good for anything else except grazing.

Senator REED. That is a high figure, is it not?

Mr. ARAM. That is what we are paying.

Senator SMOOT. You are paying that for land in California?

Mr. ARAM. Yes. This tobacco being grown on hillsides there are numerous ravines, gulleys, steep banks of the ravines, and other waste area that can not be cultivated, and the cost of the entire land must be charged against a productive area only.

Senator WATSON. You are asking for a tariff of $1 per pound on the Turkish tobacco?

Mr. ARAM. Yes, sir. I am asking that there be no change in the Fordney rate.

Senator WATSON. On the theory that you can raise and are raising Turkish tobacco which you want to be protected from imported Turkish tobacco?

Mr. ARAM. Yes, sir. We have an established industry that has every claim to protection—in fact, it can not survive without it.

Senator WATSON. You want the Turkish-tobacco industry protected? These gentlemen say that you are not raising it, and you say you are. They say that they can not use it.

Mr. ARAM. Yes; that is what they say.

Senator WATSON. How do you propose to prove your position? You say they can use it and they say they can not. How do you propose to show that it can be used?

Mr. ARAM. They did use it as long as they could get it at their own figure. Here is a pamphlet published by the American Tobacco Co. in 1909. It goes into detail and tells the farmers how they should raise the Turkish-type tobacco. They have a statement here to the effect that the thing is an absolute success and that it is an established industry.

Senator REED. What year was that?

Mr. ARAM. 1909.

Senator MCCUMBER. Do they say it is a Turkish tobacco?

Mr. ARAM. The entire pamphlet is on Turkish tobacco. I have a letter here from Gaston & Co., importers and brokers of Turkish tobacco. They are also small manufacturers. It is dated New York, August 20, 1917, and is signed James G. Gaston, and is as follows:

DEAR SIR: Your letter of August 2 received, also the samples. I am very well pleased with the quality and I will buy all the tobacco, more or less than 60,000 pounds, so please write me a letter, and tell me what price do you consider right for this year's crop and when the tobacco will be ready for shipment to New York.

I hope you will grant me a reasonable price so we will be able to do business this year.

Hoping to receive a favorable reply, I am, etc.

I have another letter here which speaks of the visit of Mr. Kahaya, president of the Standard Commercial Tobacco Co., New York. This company makes all Turkish-tobacco purchases for the Camel cigarettes.

TURLOCK, CALIF., *April 23, 1921.*

Mr. ALFRED ARAM, *Fresno, Calif.*

DEAR SIR: In reply to your request concerning certain interview with Mr. Kahaya, president of the Standard Commercial Tobacco Co. of New York, I beg to state that, to the best of my recollection, it was some time in the month of December, 1917, or in the month of January, 1918, that Mr. Kahaya examined our tobaccos in Santa Clara County and in the presence of a number of gentlemen declared that our California-grown Turkish tobacco was a distinct success, in color, size, aroma, and oily quality and body of the leaf. I remember that he expressed great enthusiasm, and further added on his return from the Orient he would be ready to invest millions in our California-grown Turkish tobacco.

However, I believe Mr. Kahaya's expert opinion subsequently appeared in an interview published in the San Francisco Call some time later. That opinion was very flattering to the California product.

Very sincerely, yours,

ARAKELIAN BROS. & CO.

Senator SMOOT. That is when they were spending money t develop the industry?

Mr. ARAM. That is during the time when they were making mon buying the farmers' crop at confiscatory prices. They did not co out there to develop the industry. They came out there after t industry had started and came there to put it where they wanted but the farmers would not stand for it. For instance, when the ti came to deliver the tobacco to the buyer the farmer was inform that he must deliver it to the company warehouse at Merced. No this town happened to be 60 miles from the tobacco-growing sectio There was not a pound of tobacco grown within less than 60 miles Merced. The farmers would protest. Some would refuse to do s others would deliver. When the tobacco arrived at the wareho the farmer was then told what he would get for his tobacco.

After spending several days to pack and cart his tobacco to th distance he did not have the heart to cart it back another 60 mil and so he let them have it at their own price. After awhile t farmers would not have anything to do with him. There we protest meetings. The chambers of commerce of the various di tricts had to consider the situation, and the sentiment of the peop was so aroused that it was not the safest thing to go through th districts and be known as manufacturers' agents. The manufactur stayed there as long as the loot lasted and discontinued only becau outraged public opinion would no longer tolerate their tactics and t manufacturers were convinced that the supply could not be co trolled. Only a tobacco farmer knows the imperial arrogance of t tobacco buyer and his chief, and yet these men come down he before Congress and state without blushing that they went out California to try to develop the industry.

Senator McCUMBER. You have had 12 years since then to demo strate that.

Mr. ARAM. As to the quality, we are perfectly willing to get sampl of both imported and domestic-grown tobacco and make any te to satisfy this committee, if any doubt exists.

Senator McCUMBER. You think that any smoker who would use for a month could not tell the difference?

Mr. ARAM. There is no smoker in the country who can tell t difference. The manufacturer himself can not tell it. I have tri it on them.

Senator McCUMBER. Then why is it they can not sell it for as go a price, if they can make a cigarette that the smoker can not tell?

Mr. ARAM. That is, the American-grown tobacco?

Senator McCUMBER. Yes.

Mr. ARAM. They can and they have used it, but the domes product cost more than the imported. They would lose money they used our tobacco, especially now when the imported article going around begging for a buyer. The question of quality that t manufacturers have raised is not sincere. It is a question of t domestic costing more than the imported and also of encouraging source of supply which they can not control.

Senator McCUMBER. With a great many it seems to be a questi whether or not it will measure up in quality with the Turkish t bacco.

Mr. ARAM. We will dispose of that question by the method that I spoke of.

Senator McCUMBER. That would be to your satisfaction, but can you satisfy the buying public with that?

Mr. ARAM. I do not think the buying public can tell the difference between third-rate and first-rate Turkish tobacco, to say nothing of tobacco of the same quality. It is the manufacturer who says that this is not Turkish tobacco; in other words, the manufacturer wants to be judge, jury, and prosecuting attorney all at once. As to satisfying the public, we may yet go into manufacturing, and the public will give its verdict soon enough. About two months ago I made a few hundred cigarettes by hand. It was from tobacco that the association has in New York warehouses. I gave some of these cigarettes to Congressman Free of California. A few days after that he was in a banquet in Chicago and passed one of these cigarettes to the gentleman sitting next to him. He happened to be a fastidious Turkish-cigarette smoker and immediately inquired of Mr. Free as to where he could buy these cigarettes. There is nothing in this talk of the manufacturers about the quality. They were after it hard enough when they could get it on their own terms.

Senator McCUMBER. Your position is then, as I understand it, that these manufacturers, these large manufacturers, who can afford to buy in large quantities, are refusing to buy your product simply in order to destroy the business; that they really think it is just as good as the other, but they do not desire to purchase it, but want to drive you out of the market?

Mr. ARAM. Not necessarily.

Senator McCUMBER. Then why don't they buy it, if it is just as good?

Mr. ARAM. We can not sell it for the same price that the imported leaf costs them. If we did that, we would have to get out of business. We can not do it for the same price. So far as the manufacturer is concerned, if I were the manufacturer I would not buy the American-grown Turkish tobacco and pay more for it if I could get the imported article for less.

Senator McCUMBER. You say that the imported article, without paying duty, will cost 50 cents?

Mr. ARAM. More than that.

Senator McCUMBER. What will be the average?

Mr. ARAM. I can not say.

Senator McCUMBER. Well, we will say 75 cents. Then you would have to add 35 cents duty?

Mr. ARAM. Yes.

Senator McCUMBER. That would make $1.10.

Mr. ARAM. Yes.

Senator McCUMBER. If you get $1.10 can you make money?

Mr. ARAM. No, sir; it would be below the cost of production.

Senator REED. Let me ask again the last part of Senator Watson's question. You say that the American tobacco combination, or the big manufacturers—I will refer to them by the most offensive name I can think of—will not buy your tobacco although it has gone down to nothing, and the reason they will not buy your tobacco is that they want to put you out of business?

Mr. ARAM. Not necessarily; I did not say that. Our tobacc has not gone down to nothing. We insist on a fair price.

Senator REED. That is the way I understood it. Now, supp you put $1 per pound tariff on it. They are still actuated by th same motive. How are you going to make them buy your tobacc Why wouldn't they buy the foreign tobacco, as they do now, an refuse to buy your tobacco and charge the American consumer a littl more for the cigarettes?

Mr. ARAM. The question as to California tobacco—that is, as t whether they would buy or not—came when they realized that ou tobacco was costing more than the imported product, and they g wind of the fact that we wanted a tariff. What they wanted t prevent, and what they have tried to bring about for several year is that we should have no industry to talk about and ask protec tion for. As soon as we have a tariff for protection and the co in this country and the cost on the other side is equalized, then w can sell. They will buy it. Capital has no country and no favorit There is nothing personal in the manufacturers' attitude. But l us assume that even after the costs here and abroad have bee equalized they will not buy. We consume over 55,000,000,00 cigarettes a year in this country. About 85 per cent of that con sumption is represented by the so-called blended cigarettes. Wh is there not one manufacturer outside of the big five making blende cigarettes?

The reason is, when an independent operates on a scale where h needs large quantities of Turkish tobacco he gets into hot wate The supply is controlled. If the manufacturer is sufficiently shor sighted—which I don't believe he is—not to buy the domestic le when it can be given to him at an advantage over the importe through better quality, grading, etc., he will be exposing himself competition in the manufacturing field. I look to see the time wh the tobacco farmers' cooperatives will follow their product from fie to consumer, giving a fair smoke at a fair price. So, once you equa ize the cost here and abroad, you can trust the American farmer fight his battles. Tobacco growers' cooperatives selling their ow manufactured brands and telling the public why they were driven manufacture will make mighty good reading, and I don't belie the present manufacturing interests have any stomach for it. believe, however, that is coming in spite of what they may do. will be the first time the American public will get an honest smoke a fair price. There is too much advertising humbug and not enou value given in the tobacco business as it is conducted now.

Senator REED. You say that the little fellow is not buying, a the big fellow will not buy?

Mr. ARAM. They will later on. We can not live on the little f low's business.

Senator REED. Why not to-day?

Mr. ARAM. Because now we can not sell in competition with t imported leaf; when we have a protective tariff, it will be a differe story.

Senator REED. Let me read these figures to you: In 1918 y raised 870,000 pounds; in 1919, 1,525,000 pounds; in 1920, 700,0 pounds; and in 1921, 40,000 pounds. Now, if this conspiracy ex to put you out of business, and they will not buy your tobacco at

d you put a $1 a pound tariff on it, how are you going to make em buy?

Mr. ARAM. We are not going to force anybody to buy our products. believe I tried to make it clear a while ago. The reason that they ve held back for the last three years from buying is that the imrted leaf is much cheaper, and also they knew we were trying to vestigate the cost of the product on the other side and the cost of r product, and we were getting ready to come before a Republican ngress for protection. When the protection is given that will nish.

Senator REED. Three years ago?

Mr. ARAM. We began three years ago.

Senator REED. And you foresaw a Republican Congress. You did t know three years ago we were going to have one, did you?

Mr. ARAM. We were quite sure we were going to have one before ng.

Senator REED. You had better get filled up this time because you e not going to have one next year. [Laughter.]

Mr. ARAM. We will roll up a majority in California, any way. The rmers are protective tariff Republicans.

Senator McLEAN. How many pounds of tobacco does it take to ake a thousand cigarettes?

Mr. ARAM. Three pounds.

Senator McLEAN. So that a dollar a pound for the cost of the bacco in the cigarette would amount to 3 mills for the cigarette?

Mr. ARAM. I have a letter here from the Tobacco Products Corporaon, signed by James A. Dixon, in which he says:

> We are able to buy tobaccos that are equally as good tobacco in quality as the Calima tobaccos. of the 1913 crop, at 21 cents per pound f. o. b. shipping point: this ith the duty and expenses added brings the cost of same considerably below that hich you state the best of your tobacco has cost to produce, and we are therefore able to consider entertaining any proposistion to purchase these California tobaccos a price such as you mention.

Senator REED. What is the date of that letter?

Mr. ARAM. February 18, 1918.

Senator SMOOT. That is Colorado tobacco?

Mr. ARAM. California tobacco.

I have another letter from the Melachrino Co., dated New York, ovember 10, 1916, in which it states as follows:

> Your samples of California tobacco received a few days ago. We have examined em thoroughly and have also smoked cigarettes from this tobacco, but hardly think at we will be interested at the prices quoted in your telegram.

This is the Melachrino Co., making one of the highest grade Turkish garettes. You will note that they state they have smoked the bacco, but there is no objection or even mention of anything about uality. The contention has always been and is now on the price, cause we have not been able and we can not now sell the Americanown tobacco for the same price that the farmer on the other side n sell it for.

Senator LA FOLLETTE. Will you select from your material there l the letters that bear upon this subject—the telegrams and pamhlets, etc., that you have referred to?

Mr. ARAM. Yes, sir.

Senator LA FOLLETTE. And the charts that you have made?

Mr. ARAM. Yes, sir.

Senator LA FOLLETTE. And pass them to the reporter and let then be made a part of your statement?

Mr. ARAM. I will do that.

Senator REED. You say you have an association of 300 members

Mr. ARAM. Yes, sir.

Senator REED. Do you market everything through that associa tion?

Mr. ARAM. Yes, sir.

Senator REED. Why?

Mr. ARAM. For self-defense.

Senator REED. That is what Germany said when she built up he army.

Mr. ARAM. I do not know any better way of selling products tha through the association. We tried the other way.

Senator LA FOLLETTE. You sell your product just as the Californi fruit producers sell their products?

Mr. ARAM. Yes, sir.

Senator REED. You do that so that you can keep the price up, d you not?

Mr. ARAM. No, sir.

Senator REED. To keep it down, I suppose?

Mr. ARAM. No, sir. We keep the cost of production down.

Senator REED. The cost of production?

Mr. ARAM. Yes.

Senator REED. Doesn't each individual raise his own crop?

Mr. ARAM. Each individual raises his crop and manipulates it to certain point. After that, instead of each individual doing t curing, grading, etc., we do that through the central warehous which makes it cost less and also insures an impartial grading. insures shipping in car lots and every advantage to lower overhead.

Senator REED. All right. When you get it in that shape all t tobacco of all the members of the association has to be market through one agency, does it not?

Mr. ARAM. Through the board of directors of the association.

Senator REED. You have all the growers of this character tobacco in that association, have you not?

Mr. ARAM. Yes, sir.

Senator REED. You expect to get them all, don't you?

Mr. ARAM. Not all.

Senator REED. Substantially all?

Mr. ARAM. Yes; substantially all.

Senator REED. I am talking about them generally. So, if we p on this tariff and shut out the foreign tobacco——

Mr. ARAM (interposing). We are not going to shut it out. T protective tariff on wrapper leaf has not shut out imports. There more imported now than there was before the tariff. I will sub a carefully prepared chart on that subject for the record.[1]

Senator REED (continuing). There will be but one seller of yo tobacco in the United States, and that will be your association?

Mr. ARAM. Yes. That may be.

Senator REED. That will be a good thing for you.

---

[1] Omitted in printing.

Mr. ARAM. My best answer to that is that the results of cooperative marketing of farm products throughout the United States is to the advantage of every one. The cooperation is not for the purpose of holding up the public or the purchaser. It insures quality, grading, etc., and it also protects the farmer against the manufacturer who has shown that he knows how to take advantage of the unorganized producer.

Senator REED. And also prices.

Mr. ARAM. Of course, we have got to get back our money.

Senator REED. You know that your literature is full of representations to your members that by joining this association they can get better prices.

Mr. ARAM. If we can grade better——

Senator REED (interposing). I did not ask you that. I asked you if your literature is not full of statements to the effect that you can get better prices by joining the association?

Mr. ARAM. If the individual farmer dealt by himself, he would have to sell at the purchaser's price, and the consumer does not get the benefit.

Senator REED. And you don't intend to do that?

Mr. ARAM. My answer to that is that I have a letter written to each individual grower to the effect that the policy of the association will be as follows: We will compute the exact cost of growing and marketing and we will then charge so many per cent for profit, and so on. I can produce that letter. Only yesterday the President of the United States urged in his message to Congress that the farmers' cooperatives further extend their activities. The cooperative principle as it has been demonstrated in this country is not on the defensive. It needs no apology.

Senator REED. That is what the Steel Trust does, too.

Senator LA FOLLETTE. You have to deal with powerful interests, do you not?

Mr. ARAM. Yes. In our case at least we have to deal with industrial imperialists. I have an editorial here which appeared in Forbes' Magazine of January, 1921. It says, in part:

The unhappy truth is that several of the most powerful tobacco leaders are men of none too admirable type. They are a callous, heard-hearted, mercenary, money-grabbing lot, given to questionable operations to line their pocketbooks. It would be very salutary if the Department of Justice were to unearth a conspiracy to fix absurdly low prices for the growers' crops and then throw a few of the conspirators into jail.

The manufacturing group not only cooperates, but conspires also.

Senator REED. You would be a trust in absolute control of this particular tobacco if you could shut the foreign tobacco out and compel the consumers or manufacturers of tobacco to look alone to your single association. You would have every element of a monopoly, wouldn't you?

Senator MCLEAN. The American Tobacco Co. made 20 per cent on its common stock last year. That was pretty good considering business conditions. It is your idea, is it, that the farmer should have 10 or 15 per cent profit?

Mr. ARAM. Fifteen per cent above the actual cost of production, or whatever will be a fair profit to compensate the farmer for his work.

Senator REED. I do not hold a brief for the American Tobacco Co. I have said some mean things about them. I shall probably have some more mean things to say in the future. I am not in favor of enabling one monopoly to build itself up because an old one exists. You have said that you intend to draw into your association the men and——

Mr. ARAM. We have them now.

Senator REED. And you have a single selling agency?

Mr. ARAM. Yes.

Senator REED. You want to put up the tariff so that the manufacturer of tobacco has to buy your tobacco?

Mr. ARAM. We want the tariff so that when the imported product is laid down in New York and the American product is laid down in New York they will both have an equal chance, then let the two fight. Now we have no show. But, if you want to know what the farmers are thinking about, let me say that I have already taken some action in getting in touch with other growers of tobacco and if we can bring it about it is our intention to have the farmers' cooperatives sell direct to the consumer. As to the kind of literature we send out and what we are trying to do I will pass a letter into the record which will show our attitude on that subject:

AUGUST 19, 1921.

HON. FRANK PARK, M. C.,
House of Representatives, Washington D. C.

MY DEAR JUDGE PARK: A few days ago you spoke of the problems confronting the tobacco growers of the United States. I agree with you that the situation is intolerable both from the standpoint of producer and consumer. However, if we are to apply the proper remedy, we must know the exact causes responsible for the present condition.

The tobacco grower is the starting point of the entire tobacco industry from field to consumer. He is the king pin. Without him there would be no tobacco industry. This being true, it follows that no branch of the industry has any right to exact profit unless the man who produced the tobacco has received fair compensation for his labor and a fair profit on his product. In other words, if there is any profit in the tobacco industry, the farmer has first lien on it to the extent of his just share.

The manufacturers deny this fundamental proposition of sound economics. Instead, they have constituted themselves into an autocracy of this great industry. And this is just what ails the industry to-day.

Democracy is the antidote for autocracy. And the remedy for the present situation is more democracy in the industry all along the line from producer to consumer.

We have tried investigations, and we have had dissolution. You can not legislate the spirit of fair play and honorable dealing into a man trained in the school of avarice. Perhaps this was what Mr. Justice Harlan of the Supreme Court had in mind when he said:

"I confess my inability to find, in the history of this combination [the Tobacco Trust] anything to justify the wish that a new condition should be 'recreated' out of the mischievous elements that compose the present combination, which, together with its component parts, have, without ceasing, pursued the vicious methods pointed out by the court."

I am not a lawyer. To what extent the letter and spirit of the dissolution order is being obeyed I can not say. I don't know that it is important. The thing that interests me is this: The man who produces the tobacco is not getting fair returns. The man who consumes the tobacco is being exploited and is not getting quality.

The farmers and the consumers may not be able to explain the chemistry of rain, but it is a dead-sure shot they all know when they get wet. Why not come in out of the rain?

Why go on with a system that has been tried and found wanting and is getting worse every year?

We have the tobacco and we have the capital. Why not follow our product from field to the factory and to the consumer? There is not a smoker in the country who does not know that he is not getting what he pays for.

If the farmers will manufacture their tobacco, giving the consumer fair goods at fair prices and tell the public why it was necessary for them to do this, they can forget the tobacco barons.

This is the only solution I can see and I agree with you that the first step toward this cooperative effort of the farmers is to call a meeting of representatives of the various tobacco growers of the country.

Let us forget the manufacturers and do some constructive thinking of our own. It may be that for the present the manufacturers have a monopoly of this industry. I am willing to concede that point to them. But they have no monopoly on brains, energy, vision, and capital. And since we produce the tobacco that is all we need.

As to our fight for a fair tariff on Turkish-type tobacco, the manufacturers know that the tariff we got from the Ways and Means Committee does not mean an increase on the imported leaf to them. However, they are now in Washington, the entire tribe of them, with a few high-priced lobby lawyers, trying to have the tariff taken off the bill. They do this because they know that this tariff will promote the home production of this leaf, and since it is necessary for blending purposes they don't mean to let any competition develop in the manufacturing field, as you know they control the available supply on the other side. And that is all there is to this fight.

Please feel that you can call on me whenever I can be of service in this matter.

Very sincerely, yours,

ALFRED ARAM,
President Associated Tobacco Growers of California.

There is no reason, so far as I can see, why a man in England should smoke a cigarette for which he pays the same price that an American who smokes the same cigarette pays after considering the 100 per cent higher tax that they pay in England and the fact that in the United States the cigarette is made where the tobacco grows at the doorstep of the factories.

Senator REED. I want to ask you a question about this. I hope you can give a direct answer. You say that the cigarette retails in England at the same price as in the United States, although the English tax, the import tax, is heavier than the aggregate of the domestic taxes on the cigarettes in this country. You say that that applies to the retail cigarette. I want to know about the wholesale price.

Mr. ARAM. I know nothing of the wholesale price. We had a man go around in England, stop at a store, ask for a cigarette, and pay for it.

Senator REED. Of course, the American retailer may be charging one price and the British retailer another. What you say about the cigarettes—and I am not trying to argue this point with you—is true of many things made in this country and sold abroad. I think it is generally true that the foreign price is less than the domestic price here on nearly everything exported from this country. Isn't that your understanding?

Mr. ARAM. I do not know about the other commodities. I have been so busy with tobacco that I have not had the opportunity to study the others. But the reason it is so in the case of tobacco products is that the manufacturers have a high tariff in this country on cigarettes, so they have a tariff wall around the country so high that the foreign manufacturer's cigarettes can not get in, and, there being no competition within the country, they can charge what they please. But when they go to England or other countries they have to meet competition. And when it comes to protection, I have a photograph here which I will pass to the committee. It shows a port on the Black Sea where tobacco is being loaded for shipment to America. Out in the distance you can see an American destroyer. So the manufacturers are not only getting all the protection they want against foreign competition, they get some unusual protection

in obtaining raw materials wherever they can get it cheapest, even if it takes American destroyers to protect them in troubled countries so that they may bring this tobacco and compete against the American farmer. I will also pass a report for the record which bears the date of September 12, 1921. It is from Rear Admiral Bristol, United States high commissioner at Constantinople, to the Secretary of State. It says in part:

The Samsoun offices of the American tobacco companies have been able to k... in touch with their Constantinople and New York offices owing to the presence of our destroyers at Samsoun and our permission to send mail by these destroyers and to transmit urgent messages by radio.

I am sorry Admiral Bristol neglected to mention that the representatives of the American tobacco companies have been also riding back and forth on our destroyers between Constantinople and Samsoun, all of which is very proper and commendable, but how about some protection for the American farmer?

Senator REED. Don't you think it would be well to find the wholesale prices of these cigarettes as well as the retail prices?

Mr. ARAM. When the manufacturers come down to Congress and say, "If you raise the price of the blended cigarette thirty-two one-hundredths of a cent per package of 20, we will be ruined," I want to know how they do it in England. Here, for instance, is a cigarette made of pure Virginia tobacco. It is the highest grade. It sells for 10 cents in England. I got my information from the manufacturer himself. It is made by the British-American Tobacco Co., either the parent or the child of the American Tobacco Co., I don't know which.

Senator REED. That is made in England?

Mr. ARAM. Made in England.

Senator REED. What does it sell for?

Mr. ARAM. Ten for 10 cents.

Senator WATSON. Is that made of pure Virginia tobacco?

Mr. ARAM. It is made of pure Virginia tobacco.

Senator LA FOLLETTE. What does it sell for in this country?

Mr. ARAM. Ten for 10 cents also. The taxes run like this: In England this cigarette pays a tax of $4.90 to the British Government. In America it pays $3, to say nothing about the cost of transportation and insurance.

Let me say that the British taxes, income taxes, etc., are much heavier in England than in the United States, yet an Englishman smokes better cigarettes—I think it is a better cigarette; it does not contain "57" varieties of artificial flavorings—for the same price that we pay in the United States where tobacco is grown at the factory doors. Now the American manufacturers say, "If you raise this duty, you are going to ruin us," that the smoke will never again rise out of their factory chimneys.

Senator REED. What was the labor cost in that English cigarette?

Mr. ARAM. The labor cost?

Senator REED. Yes.

Mr. ARAM. I do not know. I discussed that matter with Mr. Dushkind, secretary of the Tobacco Merchants Association. He is here in this room now. I called his attention to the fact that the manufacturers had a very high duty, almost a prohibitive duty on cigarettes, and that they were very well protected, but that when you come to protecting the farmer they do not believe in protection.

nd he stated to me that no country can compete with the United tates in the manufacturing of cigarettes.

Senator REED. We have to pay more for our labor here, do we not?

Mr. ARAM. I do not know about that.

Senator REED. Well, I want to get back to this tax phase. You ay the direct tax is $3 and the English tax is $4.

Mr. ARAM. There are two classes of tax in England. I do not now which one they did pay. I am going to give the American nanufacturers the benefit of the doubt. If the tobacco contains ess than 10 per cent moisture they paid a rate of $5.62. If the obacco they use contains more than 10 per cent moisture they pay $4.90. Now I am taking the $4.90 rate.

Senator REED. Very well, we will take $4.90. Are there any ther taxes to be paid in this country by the manufacturers?

Mr. ARAM. The license tax, the same as in England. It is heavier here.

Senator REED. Is there any other? Do they pay county and State taxes?

Mr. ARAM. They pay the same thing in England and more.

Senator REED. I am speaking now of the price of the cigarettes.

Mr. ARAM. Yes. So far as the selling cost is concerned, it ought o be less in the United States because it is practically under one head. Because it is under one head the business ought to be done more cheaply over here. And the consumer should be given some of the saving.

Senator REED. Your theory is that they can raise tobacco as cheaply here as they can abroad.

Mr. ARAM. I do not know what is going to happen.

Senator REED. Until they change their living conditions in this country and in Turkey, where they raise Turkish tobacco, you can not compete, can you?

Mr. ARAM. No, sir.

Senator REED. That is a permanent condition until the whole world changes, is it not?

Mr. ARAM. Yes; unless the other countries growing tobacco change to our standard of living.

Senator REED. I will ask you this: Under those conditions, can we compete?

Mr. ARAM. No, sir. We can not compete under the present conditions.

Senator REED. Some gentlemen raise peanuts. They say they can not compete. Other gentlemen raise long-staple cotton, and they say they can not compete. Do you believe in putting a tariff on them?

Mr. ARAM. Absolutely. We are better off in the long run. Everybody in the United States is better off under the protective tariff principle.

Senator REED. Therefore, we ought not to buy anything abroad that we can produce here, no matter how much it costs to produce it here?

Mr. ARAM. Well, I am not an economist. The question is not in my line. I can answer questions about tobacco. I want to come back to this cost and tax business. This morning something was said about the Pall Mall cigarette. It is considered the highest class

of Turkish tobacco cigarette. Until recently it was retailing for 30 cents; that is, $30 per thousand.

Senator WATSON. That is all Turkish tobacco?

Mr. ARAM. I think it is. It is a good cigarette. That is $30 per thousand. They sell it here now for $25 per thousand and in England for $24. The total taxes on this cigarette in this country are $4.31 per thousand, in England—I don't know just what class of tobacco they use, as to the moisture content, but giving them the benefit of the lower rate, it is $7.35 per thousand. Now, they come here and say, "You are going to ruin us by putting so many mills on a package of cigarettes." I will say this, if this protective duty on this Turkish type of tobacco causes the manufacturers to raise the price to the consumers, there are quite a number of gentlemen in this country that nothing would suit them better, because they will then go to manufacturing. The Fordney tariff on this tobacco will do more toward bringing competition in the cigarette business than all the investigations and dissolutions have or can accomplish. Manufacturers know this and that accounts for their frantic efforts to take it off the bill.

Senator McLEAN. Did you get those figures right?

Mr. ARAM. $25 per thousand in this country and $24 per thousand in England.

Senator LA FOLLETTE. Is that the wholesale price?

Mr. ARAM. No, sir; it is the retail price at the store.

Senator McLEAN. What is the difference in the tax here?

Mr. ARAM. In America it is $4.31; in England, $7.35. Besides they have to pay the same price on the other side for tobacco that goes both to the factory in England and here.

Gentlemen of the committee, this industry can not go any further unless there is a protective tariff. It will protect our industry and it will be added revenue to the Government without putting any additional burden on the consumer.

Senator SIMMONS. There is a protective tariff. You mean a tariff of a dollar?

Mr. ARAM. The tariff is like a pair of shoes. If the shoes are not big enough you can not wear them, and if it isn't big enough it is of no possible use to you regardless of what the size may be; 35 cents does not protect; 80 cents doesn't protect; $1 a pound is the minimum that can do us any good at all.

Senator SIMMONS. There is nothing in that sort of stuff. I want to ask you this question. You say that the present cost of our production of this tobacco, that is, the production in your State, is $1.25.

Mr. ARAM. We have an exact statement, item by item, which can be furnished to the committee. I think it comes to $1.32. I believe it averages that. We have an itemized statement there in our memorandum.

Senator SIMMONS. And you want 15 per cent profit on that?

Mr. ARAM. I do not know what profit we want. We want a fair profit and we are entitled to it.

Senator SIMMONS. You said that was the profit you sought to get through your association.

Mr. ARAM. About that; yes, sir.

Senator SIMMONS. Then you would want $1.32 plus 15 per cent. Have you calculated what that would be?

Mr. ARAM. $1.47.

Senator SIMMONS. That is what you want? That would get you out, would it?

Mr. ARAM. Yes; on some grades of tobaccos.

Senator SIMMONS. Will you be able in the future to reduce the cost of producing that tobacco in California?

Mr. ARAM. Yes. I made that statement to the Ways and Means Committee.

Senator SIMMONS. What is the price to which you hope to get the cost of production reduced?

Mr. ARAM. I can not make a definite statement in regard to that. Once the industry gets on its feet, we shall be glad to pass on to the manufacturer any reduction in production cost.

Senator SIMMONS. We will assume that the industry is on its feet. What will you be able to get the cost of production down to?

Mr. ARAM. I believe that we will be able to reduce the cost of production.

Senator SIMMONS. How much?

Mr. ARAM. I could not state. I do not know what the conditions will be a year or two years from now.

Senator SIMMONS. You said that Turkish tobacco sold in this country now from 15 to 30 cents a pound.

Mr. ARAM. That is in bond. Some of it is more.

Senator SIMMONS. You put the maximum at 30 cents and the minimum at 15.

Mr. ARAM. That is not the regular price.

Senator SIMMONS. Then the average could not be over 30 cents.

Mr. ARAM. That is not the regular price. That was following the slump.

Senator SIMMONS. I am not talking about the period before the war. What is the average price now of the Turkish tobacco in this country?

Mr. ARAM. I do not know what the manufacturers are paying. We only know our own production.

Senator SIMMONS. I thought you undertook to tell the committee that the Turkish tobacco was sold in bond between 15 and 30 cents.

Mr. ARAM. That is their statement. They said they could not pay a higher price to us, because they can get the imported leaf for that price.

Senator SIMMONS. Assume that you get down to a dollar. That is about as low as you could hope to get, is it not?

Mr. ARAM. I do not know—probably.

Senator SIMMONS. You would never hope to get it down to the Turkish price of 30 cents?

Mr. ARAM. The cost of production on the other side?

Senator SIMMONS. Yes.

Mr. ARAM. We can never do that unless we and our wives and children learn to subsist on salt fish and onions as they do on the other side and we trust this Congress will not pass such a sentence on us.

Senator SIMMONS. So that this is one case where we have notice in advance that we will never be able to produce that article in this

country for less than two or three times as much as it can be bought for abroad?

Mr. ARAM. What is that statement, Senator?

Senator SIMMONS. I say that we have notice now that in order to build up an industry——

Mr. ARAM (interposing). Not to build up an industry, but in order to help the industry that exists and to keep it from dying.

Senator SIMMONS. We will say in order to keep afloat an infant industry that produces 700,000 pounds.

Mr. ARAM. We produced over 1,500,000 pounds in 1919.

Senator SIMMONS. Out of the total production in this country of a billion and a half.

Mr. ARAM. Our tobacco is not compared with southern tobacco. There is no demand for that much tobacco of Turkish type.

Senator SIMMONS. You are asking a duty of $1 per pound.

Mr. ARAM. Yes. We ask that there be no change in the Fordney rate.

Senator SIMMONS. In order to keep that industry, that little industry, alive, and to enable it to expand?

Mr. ARAM. Yes. In order that the money American smokers pay may go to American farmers and cultivate American acres instead of going to foreign countries.

Senator SIMMONS. But at the same time you are giving us notice that when it gets on its feet and when it has expanded to its utmost limits you will not be able to produce this article in this country for less than three times as much as it costs to produce it abroad?

Mr. ARAM. I do not say how much the cost of production will be brought down, but it will not be the same as on the other side.

Senator SIMMONS. I understood you to say that it would not be below a dollar per pound.

Mr. ARAM. I did not say that. I do not know how much we can reduce our cost of production. We can not predict what the cost of production will be several years from now. That is determined by numerous elements not within our control.

Senator SIMMONS. Ordinarily, the contention is made that if we will give a struggling industry adequate protection in a short time it will grow and expand and the cost of production will be reduced to such a point that ultimately we will be able to buy the American product at a lower price than we can buy the foreign product for, but you tell this committee, as I understand it, that there is no hope of ever reaching the point where you can supply this country with this product at anything like the price we have to pay abroad.

Mr. ARAM. The Fordney rate does not justify any increase to the consumer. The American manufacturers seem to have found the way to sell cigarettes to Englishmen at less than what they charge you and I, in spite of 100 per cent differential in taxes in favor of the American consumer. It is very clear what we need is competition and the American production of this tobacco will have that tendency. The price of smoke is determined not by Government taxes, but by the degree of competition and the manufacturing and distribution. If taxes determined prices, in England they would have to pay double what we pay here, but they don't. They pay the same as over here or less. I know intimately the conditions existing in this country and those existing abroad and the difference between the

living standards of producers of Turkish tobacco in this country and abroad. If our farmers and their families and our employees must live at the same level as they do over there and under the same conditions, we do not want the industry. I do say, as I have said before, that we will never be able to reduce our cost of production here to the same level as over there unless they change their standards of living.

Senator SIMMONS. Then, the reduction in this case can never equal the cost of the Turkish tobacco abroad; that is to say, it will never come to the point where it is sold as cheaply here as in other countries?

Mr. ARAM. It can not be, unless conditions over there change.

Senator SHORTRIDGE. Mr. Aram, you have answered the Senators by stating that the average cost per pound of producing the Egyptian tobacco is about $1.25.

Mr. ARAM. About $1.32 average.

Senator SHORTRIDGE. Senator Simmons very properly, I thought, asked you whether you think that hereafter you can produce that tobacco more cheaply. Now, you are now taking into consideration the various elements that go to make up that sum total, are you not?

Mr. ARAM. Yes, sir.

Senator SHORTRIDGE. Such as the cost of labor, taxes, and all the incidental expenses that would occur?

Mr. ARAM. Yes.

Senator SHORTRIDGE. If the cost of labor shall come down; if taxes shall be reduced; and the various other elements of cost are reduced, you would ultimately be able to produce the tobacco, of course, at a less price, would you not?

Mr. ARAM. At a less price; yes.

Senator SHORTRIDGE. But you do not hold out the hope that the American farmers—men and women engaged in this industry—will ever be able to produce the tobacco at as low a cost as this tobacco is produced in some of these other countries?

Mr. ARAM. I am positive that will never be done unless they adopt higher standards of living over on the other side. But it must be remembered that while the cost of production abroad is very low and the manufacturers get it very cheap, so far as the consumers' prices of cigarettes are concerned, they might just as well support the American-grown leaf. In other words, the low cost of production over there has been of no benefit to the consumer because the manufacturer has never shared it with them.

Senator SMOOT. If a smoker can not tell the difference between the blended and the straight tobacco, why in the name of common sense don't you manufacture it for cigarettes?

Mr. ARAM. Our tobacco costs us more than the imported tobacco costs. We can not put it on the market and compete with them. Our tobacco costs us more money.

Senator SMOOT. It does not cost more than the English tobacco costs them.

Mr. ARAM. We will have to sell it in this country. We can not export our tobacco or the manufactured cigarettes from our tobacco because we can not meet competition abroad. However, we can put on the American market as good a cigarette and better than the manufacturers have ever given to the public, and even with the high cost of our leaf to us we can market it at the present prices to the con-

sumer and make a fair profit. But with the cost of the imported leaf so much lower to the manufacturer as soon as we have invested in factories, etc., and get started in distribution they will come along with a fighting brand and sell it at a price where they can still make a profit, while it would be below our cost of production. They have done this sort of thing before.

Senator SMOOT. You have millions and even billions of cigarettes that are sold in this country.

Mr. ARAM. No. We can not find a market for these cigarettes because our tobacco costs us more money.

Senator REED. I thought a moment ago you said these men were profiteering.

Mr. ARAM. I made no such statement. I simply compared prices here and in England. The committee and the public can draw their own conclusions.

(Mr. Aram submitted the following resolutions, charts,[1] and other documents:)

SACRAMENTO CHAMBER OF COMMERCE,
June 2, 1921.

Hon. SAMUEL M. SHORTRIDGE,
United States Senator, Washington, D. C.

MY DEAR SENATOR SHORTRIDGE: The board of directors of the Sacramento Chamber of Commerce has given most careful consideration to the tobacco industry of California, and unanimously urge that you use your effort to the end that Congress place a tariff of $1.80 per pound on Turkish tobacco, as requested by the Associated Tobacco Growers of California. It is vitally important that this be done if the tobacco industry in California is to be developed free from the competition of the imported leaf.

There is no comparison in labor costs between America and the Orient. At the same time the tariff requested will make no material increase in the price to the consumer of the finished product.

We will appreciate your putting forth every effort possible, and if there is any further assistance we can render to you, please feel free to call upon us.

Very truly, yours,

A. S. DUDLEY, *Secretary-Manager.*

[Telegram.]

WOODLAND, CALIF., *March 17, 1921.*

HON. CHAS. F. CURRY, *Washington, D. C.:*

Yolo County vitally interested in tariff on tobacco. Industry here could be made very successful and profitable if protected. We have half million pounds here now and no market. Question indeed vital one.

YOLO COUNTY BOARD OF TRADE.
FRED. SHAFFER, *Secretary.*

RESOLUTION BY THE YOLO COUNTY BOARD OF TRADE.

Whereas dependable advice indicates to us that the tobacco industry of Yolo County and the entire State is jeopardized by the conduct of interests opposed to California production and favorable to the importation of the product grown and prepared by the cheap labor of the Orient; and

Whereas Yolo County growers now have on hand a production estimated in value at a half million dollars and find it impossible to compete with the product of foreign countries, where cheap labor and a deplorable living condition exists: Therefore be it

Resolved by the Yolo County Board of Trade, called in special session to act in this emergency, That we ask our Senators and Representatives in Washington to exert every possible effort and encouragement to the end that an adequate protection ma-

[1] Omitted in printing.

be laid by Congress so that our people may no longer remain the victims of this unjust and unfair proposition; and, further, that a copy of this resolution be forwarded by the secretary of this board to our Senators and Representatives.

Adopted May 27, 1921.

RESOLUTION BY THE WOODLAND AD CLUB.

Whereas it has come to the knowledge of this organization that influences inimical to the agricultural interests of the county are at work in Washington; and

Whereas the tobacco industry has been developed in Yolo County to the extent that it is a potent factor in the economic well being of this community; and

Whereas this organization is fully cognizant of the vital interdependence of the agricultural and commercial interests of the community: Therefore be it

Resolved, That the Woodland Ad Club, representing the business interests of the community, heartily indorses the efforts being made to procure adequate protection for this industry and urges its Representatives in Congress to do all in their power to the end that proper protection may be had; and be it further

Resolved, That copies of this resolution be forwarded by the secretary of the club to our Senators and Representatives in Congress.

Adopted and approved unanimously, May 25, 1921.

SAN DIEGO CHAMBER OF COMMERCE,
San Diego, Calif., July 26, 1921.

Mr. ALFRED ARAM,
President Associated Tobacco Growers of California,
Care of Hon. C. F. Curry, House Office Building, Washington, D. C.

MY DEAR MR. ARAM: We have your letter of July 19, stating that the tobacco manufacturers in New York had stated to the Ways and Means Committee that they have a statement from the San Diego County Chamber of Commerce that this organization is not in favor of the development of the tobacco industry, and that it considers this industry is a failure in San Diego County.

For your information will state that the writer has been in this office for the past nine years and can not learn from our records that this organization has at any time taken such action. On the contrary, we wish to assure you that the San Diego Chamber of Commerce is heartily in favor of the development of the tobacco industry in California, and considers that it has made a good showing in this State, and that they believe it to be susceptible of great development in this region, which has been proven by the success of the industry in various parts of California.

Please be assured that we are most heartily in sympathy with this work and that we greatly appreciate the efforts of our good Congressman, Judge Swing, in expressing himself as very much in doubt as to any such expression having gone out from the San Diego Chamber. Mistakes of this kind seem bound to occur, and we are very happy to have the privilege of refuting this one and trust that our explanation is ample.

Very truly, yours,

WM. TOMKINS,
Executive Secretary.

Copy to Congressman Phil D. Swing.

[Telegram.]

APRIL 26, 1921.

Representative BARBOUR, *Washington, D. C.:*

At a meeting of the directors Exeter Chamber of Commerce to-day tariff on Turkish tobacco was indorsed. We would like you to do everything in your power to have Ways and Means Committee pass this tariff.

THE EXETER CHAMBER OF COMMERCE,
ROBT. N. RICHARDSON, *Secretary.*

[Editorial in the Sacramento Bee, May 28, 1921.]

CALIFORNIA TURKISH TOBACCO NEEDS TARIFF PROTECTION.

California and southern Oregon are the only districts in the United States suitable for growing Turkish tobacco, from which the cigarettes which millions smoke are made.

Not only are the climate and soil favorable, but the tobacco has been successfully grown, 1,200,000 pounds having been raised in 1919.

But, as with many other products, importation from countries where lower standards of living provide cheaper labor so shattered the market price that the 1919 domestic crop is still warehoused for lack of offers that would meet production costs.

To overcome this, the Association of Tobacco Growers of California, composed of the producers in this State, is asking a tariff on foreign-grown Turkish tobacco with hope of success from the present Congress.

A duty of 35 cents a pound has been imposed on tobacco imported into this country for many years. That amount is sufficient to protect the burley tobacco, grown throughout the South, where conditions are especially favorable to its production.

According to the Tobacco Growers' Association, however, 35 cents is not enough to protect the domestic production of Turkish tobacco.

A precedent is cited in the tariff duty placed on wrapper-leaf tobacco, grown in the Eastern States. Shortly after the first experiments on a commercial scale it was realized the ordinary tariff rate was insufficient, and a special rate of $1,85 a pound was secured.

In the emergency tariff bill that amount has been raised to $3.

The Tobacco Growers are asking a tariff duty of $1.80 a pound.

Exactly what the tariff duty should be to protect American growers against the handicap of cheap foreign labor, without giving such a differential as would be unfair to American consumers, the Bee does not know.

A just amount of protection, however, determinable by Congress would give the industry a chance to grow, as there are hundreds of thousands of acres in California suitable for tobacco culture.

The 1,500 acres planted in 1919, a large part in Yolo County, does not even foreshadow the extent to which the tobacco industry might grow in this State if properly protected.

Unlike most other crops, Turkish tobacco does not demand the rich lowlands for its culture. It thrives best on the hillsides that fringe the Sacramento Valley and the smaller valleys.

Irrigation is not needed, for the tobacco matures in the short space of 4 days after being transplanted from the seed beds as soon as danger of heavy frosts has passed.

Such a crop as this, for the annual importation is worth $40,000,000, would be a valuable addition in large acreage to California's products.

California should lend her efforts to securing a just tariff rate which will equalize the difference in cost between labor in foreign countries and in this country.

RESOLUTION FROM THE NORTHERN CALIFORNIA TURKISH TOBACCO GROWERS' ASSOCIATION.

Whereas it has come to the attention of the Northern California Turkish Tobacco Growers' Association that influences are at work in Washington to defeat the efforts of the Associated Tobacco Growers of California toward the securing of an adequate tariff for this industry; and

Whereas these same influences have in the past, and do now, maintain an arbitrary and stifling control over the tobacco industry, which has not only persistently deprived us of the fruits of our labors, but through various methods has prevented the industry from attaining its legitimate development in the Pacific Coast States; and

Whereas we seriously object to the enrichment of manufacturers and importers from the Orient at our expense, and the cultivation of foreign fields while our fields are rendered unprofitable, because it better serves the selfish purposes of a powerful group whose activities and methods do violence to our conception of democracy and equality of opportunity; and

Whereas, through the great difference in the cost of production in the Orient and in America, over $40,000,000 are paid annually to the foreign growers while the American product is forced from the market; and

Whereas under similar conditions Congress gave aid to the growers of wrapper-leaf tobacco of the Eastern States by levying a tariff of $1.85 per pound, and recently granted them further protection: Therefore be it

Resolved, That we respectfully request Congress to grant the growers of Turkish tobacco of California the protection necessary to free the industry from the unequal competition against the low production cost of foreign tobacco, and thereby remove the chief obstacle against expansion of this industry: And be it further

Resolved, That copies of this resolution be forwarded to our Senators and Representatives in Congress with the request that they do whatever is in their power to secure the necessary protection asked for by the Associated Tobacco Growers of California.

Unanimously approved and adopted at a special meeting, held in the rooms of Yolo County Board of Trade, Woodland, Calif., this 27th day of May, 1921.

[News item.]

FRESNAN FIGHTS FOR TARIFF—TOBACCO GROWERS BUCKING "TRUST" IN WASHINGTON.

EXETER, *August 6*.

Alfred Aram, of Fresno, president of the California Association of Tobacco Growers, who is in Washington, D. C., fighting for a tariff on tobacco sufficiently large to allow the California grower to raise tobacco, has sent out a call for affidavits showing that the tobacco raised in the Exeter district, when the "trust" had a farm here, was considered of a very good quality. The secretary of the local chamber of commerce during the last few days has gathered some of the documents from residents who raised the tobacco at that time. At the present time the "trust" discredits the California product.

THE AMERICAN PROTECTIVE LEAGUE,
New York, April 28, 1921.

Hon. WILLIS C. HAWLEY, M. C.,
Washington, D. C.

DEAR MR. HAWLEY: In connection with the agricultural schedule, which has been referred to your subcommittee, we are inclined to think that you will find some peculiarly powerful influences opposed to an adequate protective tariff on American Turkish tobacco which has been developed on the Pacific coast.

As you know, we never recommend a rate of duty, but feel that if the American-grown Turkish tobacco is equal to the foreign, it should be classified at a higher rate than filler tobacco.

Very truly, yours,

WILBUR F. WAKEMAN,
Treasurer and General Secretary.

[United Chambers of Commerce of the Sacramento Valley, representing the chambers of the following counties: Amador, Butte, Colusa, El Dorado, Glenn, Lassen, Modoc, Nevada, Placer, Plumas, Sacramento, Shasta, Sierra, Siskiyou, Solano, Sutter, Tehama, Trinity, Yolo, and Yuba.]

BENICIA, CALIF., *June 29, 1921.*

Hon. CHAS. F. CURRY,
House of Representatives, Washington, D. C.

DEAR MR. CURRY: At the monthly meeting of the United Chambers of Commerce of the Sacramento Valley held at Oroville, Calif., on June 11, 1921, a resolution was unanimously adopted expressing the view that the California growers of Turkish tobacco should be given adequate tariff protection for their product and requesting that the United States Senators and Members of Con-

gress from the State of California be asked to use their best efforts towar securing such protection in the pending tariff bill.

The above action was based on the showing that there has been develop within the State of California, on a scale of considerable importance, the grow ing of tobacco of the type under consideration. This development has bee especially great along the foothills of the Sacramento Valley in the territo covered by this organization. It is claimed by the officials of the Californi Tobacco Growers' Association that, with the existing tariff rates on this cla of tobacco, the California growers find themselves unable to compete wit tobacco of similar quality being imported from China, Turkey, Greece, Japa and other countries in which the rates for labor are much lower than those i the United States.

As bearing out this view, the secretary of the Yolo County Board of Tra states that there are at present approximately one-half million dollars wort of Turkish tobacco stored in the warehouses of that county for which no reaso able sale price has been obtainable. He states that similar tobacco from oth countries to a value of approximately $3,000,000, and from China to a value approximately $6,000,000, has passed through California eastward since th stock has been in storage in Yolo County. The providing of a higher tari for the California tobacco would evidently be in line with what has heretofo been done for certain types of tobacco grown in Eastern States.

Sincerely, yours,

E. P. O'Hern.

President United Chambers of Commerce of the Sacramento Valley

---

Penryn, Placer County, Calif., *July 26, 1921*

Mr. Alfred Aram,

President Associated Tobacco Growers of California,

Washington, D. C.

Dear Mr. Aram: In answer to your letter of July 16, with reference to t sale of my tobacco, I am inclosing herewith all letters I have in this connecti You will note I have italicized a portion of Mr. Wilson's letter, which proves, i my estimation, the manufacturers are willing to pay a fair price under certa conditions.

Yours, very truly,

H. R. Owe

New York, *April 21, 1921*

Mr. George W. Bisbee,

Pioneer Fruit Co., Sacramento, Calif.

Dear Mr. Bisbee: I presume you thought from my silence that I had forg ten to attend to the sale of the tobacco, but for four or five days last week ra road conditions were such that I was unable to even get into New York. W when I did last Friday I started at once to try and interest some one in t proposition.

The United Cigar Stores Co. could not handle it, and sent me to another lar corporation. After looking at the sample they told me in the first place th would not buy 9½ tons from such a small sample, and wanted to know if t shipper would send three or four bales as a representative sample of the ent lot; that upon a thorough examination of these bales they might find mo better tobacco than the small sample, and then they could offer more mone *That during the war, when it was hard to get from the other side, they had p as high as $1.25 per pound, but now they could and were getting plenty from other side, but they would take a chance at 30 or 35 cents.*

I then went to see the American Tobacco Co., and they said the proposit was too small for them.

Very truly, yours,

J. M. Wilson

Annual consumption of cigarettes in the United States, 1912–1920 (fiscal year

1912	11,239,536,803	1917	35,000,000,0
1913	15,000,000,000	1918	40,000,000,0

Increased duty on wrapper tobacco and the development of American wrapper tobacco has brought about increase in consumption of cigars, in Government revenue, and in imports, because the home-grown tobacco fostered competition in manufacture. Protection to the American Turkish-type tobacco will show similar results in the cigarette industry.

THE AMERICAN TURKISH-TYPE TOBACCO—ITS RELATION TO THE CIGARETTE INDUSTRY AND THE CONSUMER.

THE TERM TURKISH-TYPE TOBACCO.

The term "Turkish tobacco" is a generic term and used to differentiate between certain members of the tobacco family. Within the term "Turkish type" are included over 20 varieties of tobacco, each possessing its particular characteristics. The term has no geographic significance any more than the term "navy beans," and no country can claim it as its product exclusively.

World production (prewar period).

[1] The $8.43 internal revenue per thousand cigarettes shown for England represents duty on 3.75 pounds tobacco necessary to make 1,000 cigarettes. (There is no internal revenue in England.)

[2] No tobacco is grown in England, therefore all taxes on tobacco are collected at the customhouse at the rate of 9s. ½d. ($2.25, normal exchange) per pound of tobacco containing less than 10 per cent moisture (Class A), and 8s. 2d. ($1.96, normal exchange) per pound of tobacco containing 10 per cent or more moisture (Class B).

FREIGHTS TO NEW YORK (LEAF TOBACCO).

California points to New York, by railroad, 3,542 miles, $61.70 per ton, car lots.

Black Sea or Aegean Sea ports to New York, by steamship, 5,072 miles, $22–$27 per ton.

San Francisco to New York by rail, American-grown tobacco, $61.70 per ton.

San Francisco to New York, same railroad, imported tobacco, $50 per ton.

Compensatory duties.

Types and standard packages sold in United States.	Leaf tobacco ($1 per pound).	Cigarettes ($5.35 per pound).
"Turkish" cigarettes:	*Equivalent.*	*Equivalent.*
Packages of 10 cigarettes	$0.030	$0.160
Packages of 20 cigarettes	.060	.321
"Blended" cigarettes:		
Packages of 20 cigarettes	.005	.267
Packages of 15 cigarettes	.003	.200
Packages of 10 cigarettes	.002	.133

The duty on cigarettes is $4.50 per pound plus 25 per cent ad valorem. For the years 1919 and 1920 this amounted to $5.35 per pound.

PROTECTIVE TARIFF AND THE MANUFACTURERS.

The Fordney rate for the protection of the homegrown tobacco is $1 per pound. The tariff on manufactured tobacco is $4.50 per pound plus 25 per cent ad valorem. The combination of the two rates on manufactured tobacco gives the ad valorem equivalent of 125.84 per cent, or the specific equivalent of $5.35 per pound.

It is safe to assume that the manufacturers believe in the protective principle as applied to their product.

If they have lodged any vigorous protest against Congress protecting them to the extent of 125.84 per cent ad valorem, or $5.35 per pound, the records fail to disclose it.

The following tables, based on statistics from the Bureau of Foreign and Domestic Commerce and the Commissioner of Internal Revenue, show the practical extent of this protection:

Consumption, exports, and imports of cigarettes.

Year.	Consumed in United States.	Exported from United States.	Imported to United States.
1912	11[illegible]03	1[illegible]00	5,794,600
1913	14[illegible]71	1[illegible]00	14,375,100
1914	16[illegible]16	[illegible]00	20,124,300
1915	16[illegible]73	[illegible]00	16,209,000
1916	21[illegible]78	[illegible]00	11,137,200
1917	30[illegible]38	[illegible]00	5,144,100
1918	36[illegible]04	12[illegible]00	1,157,700
1919	35[illegible]10	16[illegible]00	16,322,800
1920	50[illegible]89	15[illegible]00	4,232,600

CLIMATIC AND SOIL REQUIREMENTS.

"Soil most favorable for the cultivation of tobacco (Turkish type) should contain clay and lime, and must be stony and airy. * * * The land is dry with the necessary warm climate for the tobacco to mature properly. There would be even danger that the sun would dry up the plants if the sea breeze did not freshen them up sufficiently. The best tobaccos are harvested on the slopes with southern exposure. Flat lands, rich in nitrogen, which are suitable for the cultivation of cereals, are not suitable for the cultivation of tobacco."—(From Les Annales Franco-Helleniques, compiled by the Bureau of Foreign and Domestic Commerce.)

The foothills surrounding the great Sacramento Valley and the slopes of the Coast Range Mountains bordering the Pacific Ocean contain several hundred thousand acres of land unsurpassed for the production of this leaf. Most of these lands are idle; some are utilized for grazing. Even if these soils were suitable for the production of other crops—which they are not—there would still remain the problem of irrigation. The conditions that make these lands desirable for tobacco culture are such that render them worthless for the production of other crops.

In the tobacco sections of California conditions of rainfall, humidity, temperature, and the absence of excessive variations in temperature between night and day are well adapted for this industry. This has been proved by the quality of the tobacco produced during the past 16 years.

Climatic data for Turkish-tobacco producing districts of the Levant.

RAINFALL, INCHES.

Production in California.

Year	Pounds.	Year	Pounds.
1906	500	1914	245,000
1907	9,500	1915	500,000
1908	30,000	1916	800,000
1909	37,000	1917	498,000
1910	300,000	1918	870,000
1911	490,000	1919	1,525,000
1912	250,000	1920	700,000
1913	215,000	1921	48,000

The fall in production since 1919 is due to the fact that the 1919 and 1920 crops are not sold and can not be sold for anything over 50 per cent of the actual cost of production.

From the beginning the industry has been a marked success as, given the proper soil, climate, and location, "the growing of tobacco is a common-sense proposition with no mystery of any sort attached * * *. The growing of tobacco in California is well on its way. In fact, it may now be regarded as an established industry * * *. The types that have been attended with greatest success are such types as are suitable for cigarette manufacture." (From a pamphlet issued in 1910 by the Exeter tobacco ranch, operated by the American Tobacco Co.)

METHOD OF PRODUCTION.

The production of Turkish-type tobacco requires the maximum of hand work, and barring the shade-grown wrapper tobacco, it is the most expensive

Method of production in California follows closely that in use in the countries of the Levant, with few improvements. For instance, tractors are used in plowing and disking the larger fields. Fermentation is accomplished in specially constructed rooms where temperature and humidity can be controlled as against the Levantine method of fermenting in "wells" dug in the ground. Winter cover crops are planted to maintain the necessary elements of the soil. Early in the spring the land is plowed and the cover crop put under. The field is then left to "take" the spring rains. The seed beds are prepared and the seed plants grown under glass. About the middle of April the field is disked and cultivated and the plants transplanted in the field. Hoeing and five to eight cultivations are given during the growing period. If pests appear, insecticides are applied. About the 1st of June breaking of sand leaves is in order. Then follows priming of leaves. Every morning before sunrise experienced men go through the field and gather the ripe leaves. As leaves ripen from the bottom of the stalk upward, the period of harvesting the ripe leaves extends over a period of 28 to 40 days, depending on the season and other local conditions. Each morning the ripe leaves are brought from the field to the "barn" and strung on cotton strings of about 6 feet long by piercing the butt of each leaf with a long needle resembling a spear. Care is taken to see that each string carries only tobacco of the same quality. On the string all leaves face in the same direction.

They are then given a preliminary sweating in specially constructed rooms where humidity and temperature can be controlled at will. This operation usually requires about 24 hours. The strings, resembling garlands, are then stretched on bamboo poles of the same length and the poles placed on horizontal racks in the open, allowing the leaves to hang down and be cured by the rays of the sun. Depending on the season, all curing is usually finished by the latter part of August. The garlands are then hung in the barn until the rainy or damp season in winter. When the air is sufficiently humid to make the leaves soft and pliable, they are taken down and put through the process of fermentation in specially constructed rooms. After fermentation the strings are carefully worked over and all unsound or otherwise undesirable leaves plucked from the strings. The strings are then classified according to quality and size of the leaf. When the tobacco is at a point containing the proper amount of moisture it is then placed in uniform rows in specially constructed collapsible box forms which are made to produce bales of the desired size. The full boxes are then placed under specially constructed baling machines and the tobacco subjected to pressure, compressing it to the size of the finished bales desired. The tobacco, which is now a compact mass with stems forming the two outer falls, is removed from the collapsible form and sewn in burlap. It is now ready for shipment to the manufacturers. The period from seed to shipment is about 13 months.

Experience has proved that saving of expenses can be effected by establishing centrally located plants in each district and relieve the individual farmer of all work by taking the tobacco after the completion of sun curing on the farms. This plan has also resulted in better standardization and impartial grading of the crops. It has resulted in more expert fermentation by making it possible to install special equipment and carry the work under the supervision of experts. The central plant also serves as the marketing center of the district. It is the plan of the Associated Tobacco Growers of California to conduct these central plants for the growers on the cooperative principle.

Cost of production in California.

[Based on unit of 20 acres.]

Labor:	
Plowing 20 acres	$35.00
Preparing seed bed	30.00
Sowing seed bed	3.00
Caring for seed bed	42.00
Disking field	35.00
Cultivating field	28.00
Transplanting	117.00
Hoeing plants	36.00
Eight cultivations	112.00
Two applications of insecticide	48.00

Labor—Continued.		
Breaking sand leaves		$12.00
Topping		16.00
Suckering twice		32.00
Gathering ripe leaves		60.00
Stringing		400.00
Hanging strings on frames and sweating		18.00
Sweating and taking to sun sheds		112.00
Attending to sun cure		48.00
Hanging in barn		12.00
Preparation for fermentation		12.00
Fermentation		360.00
Grading and sorting		50.00
Loading and hauling to station		20.00
Pulling and burning old stalks		18.00
Application of fertilizer		32.00
Supervision		1,500.00
Total for labor		3,358.00
Supplies:		
Fertilizer		2,535.60
Cover crop		9.40
Insecticide material and bran		35.76
Fuel for curing and sweating		35.00
Twine for stringing and bales		41.50
Burlap for bales		96.00
Upkeep on two horses	$290.40	
Less work paid for in labor cost items	117.00	
		173.40
Nails		3.00
Spears		2.50
Incidentals		15.00
Total for supplies		2,946.16
Depreciation:		
Building ($3,000, at 10 per cent)		300.00
Equipment ($1,265, at 15 per cent)		189.75
Total for depreciation		489.75
Insurance:		
Building ($3,000, at $1.75, 3-year plan)		35.00
Horses ($300, at $0.875)		2.62
Implements ($860, at $1.375)		11.82
Crop in barn seven months ($12,000, at $1.125)		135.00
Crop in railroad transit two months, at one-quarter per cent		30.00
Total for insurance		214.44
Interest:		
Land ($6,000, at 7 per cent)		420.00
Building and equipment ($4,265, interest charged on 55 per cent of total)		164.20
Investment in supplies ($2,946.16 for six months)		103.12
Outlay for wages ($2,378 for four months)		55.49
On insurance premiums for building		4.90
Total for interest		747.89
Taxes		153.00
Freight, 3 tons at $61.70 per ton		185.10

Permanent investment for 20 acres:

Land, 20 acres	$6,000.00
Buildings (curing barn and heating plant)	3,000.00
Two horses	300.00
Agricultural implements	350.00
Cold frames for seed beds	50.00
Baling machine	125.00
Bamboo poles (6,000)	240.00
Thermometers, seed separator, etc	37.00
Canvas shades	60.00
Lumber for seed beds	30.00
Harness	48.00
Leaf baskets (50)	25.00
Total for permanent investment	10,265.00

Cost of producing 1 pound of Turkish-type tobacco on a 20-acre farm producing 6,000 pounds.

[Average for seven years ending 1919.]

	Cost.	Per pound.
Labor	$3,358.00	$0.56
Supplies	2,946.16	.48
Depreciation	489.75	.08
Insurance	214.44	.04
Interest	747.69	.12
Taxes	153.00	.02
Freight	185.10	.03
Total production cost	8,094.14	1.34

COST OF PRODUCTION IN MACEDONIA AND THRACE.

The cost of production in Macedonia and Thrace averages $0.52 per pound. This is for the war and postwar period and is higher than the prewar cost of production. (U. S. consular report.)

"Wages paid to-day to the Turkish tobacco worker, while low compared to those paid in European and other countries, are on the whole sufficient to meet his needs." (Consular report by Consul Pinkney Tuck, jr., at Samsoun, Turkey.)

THE EXCHANGE.

Tariff on tobacco being specific per pound, the tobacco growers of the United States will get no relief from the American-valuation clause in the present tariff. How this affects the home product will be seen from the following table of values of currency of the countries now selling us tobacco.

	Turkish pound.	Greek drachma.	Bulgarian leu.	Russian ruble.
Normal exchange	$4.40	$0.193	$0.19	$0.514
Present exchange	.80	.054	.009	....

"Lately the import of tobacco in the United States has increased due to the fact that the comparative high value of the dollar makes America the best market for near eastern growers." (Near East American, p. 8, issue of July 25, 1921.)

MARKETING CONDITIONS—CONTROL ABROAD.

Since December 8, 1881, the tobacco industry in Turkey has been controlled by a monopoly known as the "Regie Co-Interesses des Tabacs de L'Empire Ottoman." The monopoly is controlled by French capital operating by the consent and under the protection of the Government.

"The Regie has the right to define the areas which can be used for tobacco cultivation, the acreage, and where such cultivation is permitted by its license, the crop remains under the absolute control of the Regie until its maturity. A price for its purchase by the Regie is then fixed. If the grower is dissatisfied with this price, and it is generally quite low, he has then the option of exporting his crop through the warehouse organization of the monopoly administration and under payment of various taxes. This regulation of tobacco is strictly enforced by police supervision and offenders are subject to heavy fines." (Official report to United States Department of Commerce, dated Apr. 30, 1921.)

Imports of leaf tobacco into the territory controlled by the monopoly is prohibited. The monopoly collects a heavy duty or tax on all imports of tobacco manufacture in addition to the regular Government tariff. By imposing heavy taxes on imports the Regie has a practical monopoly of the market for its own products.

EXPORT TAXES.

The export tax on leaf tobacco is 5 piaster per kilo, 10 per cent ad valorem crop tax to the government. (Piaster, normal value, $0.044; piaster, present value, $0.008. Kilo=2.2 pounds.)

PARTITION OF TURKISH EMPIRE AND EFFECT ON EXPORT TAXES.

In recent years large sections of the Turkish Empire have passed to other countries. The following tobacco-growing districts have been taken from Turkish control: Sections of Caucasus to Russia; Thrace, Macedonia, Aegean Islands, and Smyrna to Greece; island of Cyprus to Great Britain; west Thrace (part) to Bulgaria; west Thrace (part) to Greece; Syria under French mandate; Palestine under British mandate; Cilicia under French control; upper Armenia to Armenian Republic.

Tobacco export taxes in these districts have been repealed, with the exception of west Thrace, pending the settlement of a territorial controversy between Greece, Turkey, and Bulgaria. The present export taxes in west Thrace vary from 100 to 400 leu per quintal, according to the variety of tobacco, and in addition to this 5 leu for each bale as a statistical duty, besides several small fees. (Normal value of leu $0.193; present value of leu, $0.009. Quintal=220.46 pounds.) (From a report by His Excellency Van Walderon Baron Rongers, at Constantinople. Submitted to United States Department of Commerce by the American chargé d'affaires at Berne.)

In 1918 the Greek Government repealed tobacco export taxes amounting to 17½ cents per pound plus 8 per cent ad valorem, which had been passed as a war measure. This was applied to all exports from Greece proper, Macedonia, and the Aegean Islands. Most of our present imports are from these districts. The export tax now in force is 1 per cent ad valorem levied on all exports. (Kelley's Tariff Manual of 1921.)

The Samsoun district of Asia Minor is the only tobacco-producing section of importance now remaining under the monopoly. Since the armistice, however, there has been little, if any, exports from this section, due to the suspension of relations with the Kemalist Government, which is not recognized by the powers.

POLITICAL CONDITIONS AND THE CONTROL OF SUPPLY.

The unusual political and consequent economic conditions prevailing throughout the countries of the Near East have made it possible for a few large purchasing organizations to exercise a practical control over the tobacco available for export. The exports to the United States are controlled by the five reconstructed fragments of the former Tobacco Trust, convicted and dissolved in 1911 by the United States Supreme Court. As a means of promoting competition in the tobacco industry the benefits of the dissolution order have been theoretical. This was predicted by Mr. Justice Harlan, who delivered the dissenting opinion on May 29, 1911:

"I confess my inability to find, in the history of this combination, anything to justify the wish that a new condition should be 'recreated' out of the mischievous elements that compose the present combination, which, together with its component parts, have, without ceasing, pursued the vicious methods pointed out by the court."

Moreover, through the entente cordiale existing between the combine and the veral important European manufacturers, competition in the purchase of the af has been eliminated.

In dealing with the natives, commercial bribery and the interference of corpt Government officials in behalf of the buyers are established institutions.

"There is no very definite time fixed for the purchases made by the richer llagers or brokers. The financial situation of the cultivator and the state of s tobacco regulates the time of such purchases. Nor do any fixed prices exist. he grower, should he owe money, is usually forced to accept the price offered these two classes of buyers. Thus, tobacco which might fetch the price of 80 nts a pound is often sold at from 60 to 70 cents a pound. This is a result of e fact that the cultivator is frequently in debt to the richer villager or broker d also in need of money. Growers often remain owing large sums on their ops, as the rate of interest demanded is very high, varying from 10 to 25 per nt, with an understanding on the cultivator's part that he will sell the richer llager or broker his crop at a lower price than that demanded, or that he will pay them at an average rate of 5 to 10 cents per 'batman' (1 batman equals 52 pounds) when selling to a third party. * * * The village notables play very considerable part as intermediaries during selling time, and the buyers equently have recourse to their kind offices in endeavoring to secure a reducn of the prices asked by the growers. As a result these notables often benefit a substantial increase on the sale of their own crops. * * * Irrespective the pecuniary advances which the Regie Co. agents are in the habit of aking to cultivators, the brokers and commission agents advance funds also. he interest on the advances made by brokers and commission agents is 12 per nt (maximum). Even then, as a result of stipulated conditions between the nder and the borrowers, the rate of interest is usually increased and frently places the cultivator at the mercy of the buyer. Thus the grower, dete his apparently large benefits, is often barely able to sell his tobacco at en a small profit." (Official report to United States Department of Comerce.)

MARKETING CONDITIONS AT HOME.

Prior to the war there were a few independent importers of Turkish-type bacco in New York supplying the smaller manufacturers engaged in the aking of high-grade cigarettes for clubs and private monogramed orders exsively. Due to unusual conditions fostered by the war, both the independt importers and the small manufacturers gained some ground and strengthed their positions. The combine took careful note of this, and at the first portunity following the armistice proceeded to eliminate all importations independents. The plan has been entirely successful. It is a matter of mmon knowledge in the trade circles that the combination now offers more r tobacco at the point of production than it does in New York.

Purchases in New York are made only when it is offered at a price below the re value brought about by forced liquidations by the banks, which in rn have been brought about by the stagnation of the market artificially creed by the combination.

This condition, together with the exchange situation, has forced the prices tobacco, delivered in New York, to about 40 per cent below prewar prices. many instances the sale price is below actual cost of production.

The result of this new policy of eliminating the independent importer has n reflected in the market of the Levant.

"Information just received in this bureau is to the effect that the tobacco isis in Greece is a serious one. Thousands of okes, representing the producn of 1918, 1919, and 1920, remain unsold, and unless the Government sucds in working out its plan of exchanging tobacco for the products of other untries, the industry, which has been one of the most lucrative in the couny will be almost entirely ruined. The production of tobacco in old Greece d the Aegean Islands amounted to 15,270,000 okes (an oke equals 2.8 unds) in 1919 and 14,105,000 okes in 1920, making a total of 29,375,000 okes. the end of 1919 the amount which remained unsold, either in the hands of ducers or merchants or lying on consignment abroad, amounted to 18,478,000 es. This last figure includes the unsold tobacco of the 1918 crop. Of the 20 crop, 11,668,000 okes remain unsold. These figures do not include Macenian tobacco, very little of which remains unsold." (From unofficial report United States Bureau of Foreign and Domestic Commerce.)

In this connection it should be mentioned that it has long been the pol-
of these manufacturers to play one district against another to force a stag-
tion and consequent slump in prices in any district.

Following the armistice and the importance gained by the Greek premi-
M. Venizelos, in the allied councils, a spirit of liberalism swept through th-
Greek people. Labor unions were formed, and the farmers insisted on re-
ceiving fair returns for their products.

To crush this movement, in so far as it affected prices of tobacco, these ma-
factures shifted their purchases to other countries. The condition cited in th-
letter is the direct result of this policy.

THE RELATIVE IMPORTANCE OF TURKISH-TYPE TOBACCO TO THE CIGARETTE INDUSTRY

The consumption of cigarettes in the United States has constantly increase-
from 408,708,366 in 1880 to 50,448,541,589 in 1920.

The consumption for the first five months of 1921 is 21,448,403,105, which i-
a net gain of 6 per cent over the corresponding period in 1920. These figures d-
not include exports.

Statistics for 1919 show that over 95 per cent of our consumption is man-
factured by the combination.

Over 85 per cent of our total consumption is represented by the so-cal-
blended cigarettes made of the domestic burley or Virginia tobacco with a smal-
percentage of Turkish type for aroma and flavor.

All of the blended cigarettes are manufactured by the combination.

It is reasonable to expect that the independent manufacturers, strugg-
among themselves for their share of the 5 per cent left by the combination, w-
manufacture the type of cigarettes enjoying the greatest demand if they co-

The explanation is found in the fact that the small manufacturer is for-
to make his purchase of the imported leaf in New York, as the volume of h-
purchases would not justify his engaging in direct importation.

Purchase in New York always placed him in decided disadvantage as t-
price.

This has contributed toward keeping the small manufacturers chronical-
small.

The larger manufacturers must necessarily make their purchases in th-
Levant. There the combination is prepared to accept battle in its carefu-
prepared positions and choose its own weapon, as in the countries of the Ne-
East there is no Federal Trade Commission, no Clayton Act, and no Sherm-
law to make the battle irksome or prolong it beyond the point of being in-
esting.

It will be seen that the importance of Turkish-type tobacco to the cigarett-
industry is not measured by the relative volume in use.

The manufacturers oppose the tariff on Turkish-type leaf tobacco not becau-
it materially increases the cost of the leaf to them. It has been demonstrat-
in previous paragraphs that the repeal of export taxes and the exchange sit-
tion absorb the tariff increase of 65 cents per pound. Rather, the opposition i-
inspired, because a tariff which approximates the equalization of costs her-
and abroad encourages the domestic production and this in turn fosters co-
petition in the manufacturing field.

The development of the domestic wrapper-leaf industry brought about -
large number of independent cigar manufacturers. Prior to the developme-
of the home supply, the large manufacturers controlled the cigar industry -
virtue of their access to the foreign supply controlled by the Dutch combine.

TARIFFS, TAXES, AND THE SMALL MANUFACTURER.

The statement that increased Government taxes on the tobacco industry ha-
operated against the small manufacturer does not hold. Taxes are lev-
equally on all manufacturers.

The argument that capital necessary for the payment of taxes places a heav-
burden on the small manufacturer of limited capital also fails to be convinci-
because the capital necessary for the payment of taxes is in direct ratio to th-
output of each manufacturer.

WHAT HAS DISCOURAGED THE SMALL MANUFACTURER.

The small manufacturers are forced out of the industry because the princi-
arteries of the system of distribution are controlled by the large manufacturers

'rior to the dissolution of the Tobacco Trust competition was eliminated ough the control of manufacture. The method of eliminating competition ough control of the channels of distribution is of recent development and he real cause of the retirement of the small manufacturers from the field.

METHOD OF DISPOSING OF THE CALIFORNIA CROP.

'rom 1906 to 1912 the manufacturers sent their agents to California and de purchases at the various centers of production. This proved unsatisfac- y to the growers because the manufacturers applied the same methods of iling with the farmer as they had practiced in their dealings with the mers of the Near East.

'rior to 1912 tobacco was largely grown as a side crop on the farms, and this reason the growers did not know what their crop of tobacco cost them. t when it became generally known that tobacco required land of a type not ted to other crops, the industry was taken up by farmers of the "substantial" e in various parts of the State, and in many cases it was the only crop of farmer. This class of farmers knew how to keep books and knew what it t them to raise their tobacco crop.

t was by this type of farmers that cooperative marketing was first resorted as a measure of defense.

The present method of marketing is along the lines followed by other co- rative associations marketing farm products.

The crops of the farmers are shipped to New York in car lots and negotia- ns for the sale are conducted by a representative of the association. All ling expenses are levied on the growers pro rata to the quantity owned d the respective amounts deducted from the proceeds of the sale. Each wer is presented with a certified accounting.

So sales have been made since and including the crop of 1919.

POSSIBILITY OF EXPANSION.

Compared with other products of California, the returns from the tobacco p have been small. Yet the interest manifested in this crop and the demand the adequate protection of this industry far exceed its present monetary portance.

The governor of the State, the State department of agriculture, newspapers, mmercial, civic, and farmer's organizations have gone on record that this lustry be given the necessary protection and a fair opportunity to expand.

The chambers of commerce of 25 counties are on record for the protection of s industry because of its peculiar value to the State.

[From an editorial in the Sacramento Bee, May 31, 1921.]

"* * * A just amount of protection, however, determinable by Congress, uld give the industry a chance to grow, as there are hundreds of thousands acres in California suitable for tobacco culture. * * * Unlike most other ps, Turkish tobacco does not demand the rich lowlands for its culture. thrives best on the hillsides that fringe the Sacramento Valley and the smaller leys. * * * Such a crop as this, for the annual importation is worth ,000,000, would be a valuable addition in large acreage to California's ducts. California should lend her efforts to securing a just tariff rate which ll equalize the difference in cost between labor in foreign countries and in s country."

The land available for the culture of tobacco is far in excess of the acreage essary for the production of the entire present domestic consumption of this acco.

Within seven years California's annual production will equal our present ual imports.

The development of the domestic wrapper-leaf industry brought about the reased consumption of that leaf, while the imports also increased. The pro- tive tariff on Turkish-type tobacco will show the same results.

The Turkish-type tobacco industry has been developed in California under a dicap of comparative production cost here and abroad that might have ved discouraging were it not for the fact that this crop is peculiarly uable to the State.

First. It requires land that is now largely idle and of no value for the pro- ction of other crops. In certain sections, specially along the Coast Range,

most of the land available is of this type, and agricultural development in th sections does not at all compare with development in other sections of the Sta The extension of the tobacco industry will mean much to these sections a give them a "money crop."

Second. The culture of this tobacco requires all-year-round labor. The pe of labor demand comes at a period when other crops require a minimum of lab It furnishes employment in the winter months.

Only real dirt farmers understand what it means to employ seasonal lab and that at a time when all other crops require that same seasonal labor that same period.

Third. Tobacco is an annual plant. Unlike fruit crops, which form the bu of California's production, it requires no heavy initial investment, nor is necessary for the farmers to wait three to eight years to harvest a crop.

Fourth. All-year employment makes for permanent residents and increases t economic and social value of these residents. The comparatively small inve ment necessary and the quick returns from the culture of tobacco promot good citizenship by providing opportunity whereby the sober, industrious fa hand of to-day invests the earnings of his all-year employment and becom the farm owner of to-morrow.

The ownership of a piece of land is the antidote for the various "isms" social and economic nonsense.

All of these benefits have been demonstrated during the 16 years of toba culture in California.

California needs this crop and is eager to extend the industry. An adequ protective tariff will remove the only obstacle to expansion.

REPLY TO STATEMENT OF CHARLES DUSHKIND, REPRESENTING THE TOBAC MERCHANTS' ASSOCIATION.[1]

The Associated Tobacco Growers of California beg to submit to your honora committee the following answer to the "memorial" submitted by the Toba Merchants' Association:

The tobacco merchants' memorial cites the $40,000,000 drop in revenue fr tobacco in the last fiscal year.

The cigarette branch of the tobacco industry has shown great increase both production and in internal-revenue tax returns to the Treasury. The drop internal revenue has nothing to do with cigarettes, which from 1917 to date, period of heaviest taxation on cigarettes, has shown phenomenal increase consumption.

The report referred to by the memorial is beyond the point. British ta on tobacco were increased as a part of extreme war-revenue measures reso to by the British Government. The normal tobacco taxes in England ha always been and are now nearly 100 per cent higher than they are in United States, in spite of the fact that Great Britain has no tobacco-grow industry to protect.

The memorial compares the present United States production of Turkish-t tobacco with the magnitude of the cigarette industry.

We seek protection not to protect our present production but to enable u continue and expand the industry to the full extent of the home demand this product. If the manufacturers or anyone else can show the way to lar production without protection we shall be happy to examine the method s gested.

Did wrapper-leaf protection follow large production, or did dignity of p duction follow adequate protection. If production can be expanded or industry maintained, even at its present status, without protection where t is the need of protection.

But the manufacturers reject their own theory when applied to their prod They enjoy tariff protection of $16.05 per thousand cigarettes as against $3 p tection asked by the farmers on the leaf necessary to produce 1,000 cigar of the "all-Turkish" type and only a small fraction of that on the "blend type. The protection given us by the House committee amounts to $0.006 package of 20 blended cigarettes.

The manufacturers' protection on that same package is $0.267. In ot words, they are protected to the extent of $0.267, but when the producers

[1] See p. 2499.

the raw material are given a compensatory protection of $0.005 they are no longer willing to be counted among protectionists.

The memorial compares our production with the production of tobacco in our Southern States. These tobaccos have no place in the discussion of tariff on Turkish-type tobacco. They are not involved. If the blending of Turkish-type tobacco is essential in the manufacture of southern tobaccos, as the manufacturers claim, American farmers claim their right, as against foreign farmers, to supply that tobacco. The greatest need of the tobacco farmers of the South is open and competitive markets in which to sell their tobacco. The home production of Turkish-type tobacco will foster competition in manufacturing, and to that extent the southern farmers will be benefited.

THE EFFECT OF THE FORDNEY RATE ON THE CIGARETTE INDUSTRY.

The memorial predicts dire consequences of the Fordney rate on the cigarette industry. But their contention can not stand in the light of cold facts. The manufacturers make no attempt to explain the consumer's prices here and in England, in spite of nearly 100 per cent differential in taxes in favor of the American consumer. If they mean that the protection needed by the American farmers will be a blow to their present control of the supply and thereby reduce their monopolistic profits, there is no cause for alarm; it would be very salutary.

In their discussion of foreign export taxes the manufacturers neglect to state the export taxes in the Samsoun and Smyrna districts of Asia Minor, where since the war there have been substantial reductions. Neither do they mention the fact that the post-war purchasing power of the dollar has automatically reduced the price of the foreign tobacco by at least 50 per cent.

RATIO OF IMPORTED TOBACCO USED IN BLENDED CIGARETTES.

The manufacturers claim their blends "secret" and "therefore no official data available." It is difficult for us to understand their unwillingness to put the facts before a committee of Congress. However, they claim the average "appears to be 23 per cent Turkish."

Applying their 23 per cent average to the two of the most popular and largest selling blended brands, namely, "Camel" and "Lucky Strike," we find that with their combined daily output of 120,000,000 cigarettes these two brands alone would require annually over 30,222,000 pounds of Turkish-type tobacco. With our average annual imports of this tobacco of 35,000,000 pounds it is not clear where and how the numerous other blended and "all Turkish" brands get their supply.

WHY HAVE NOT THE SOUTHERN FARMERS ASKED FOR THIS TARIFF?

The memorial calls attention to the fact that southern farmers, producing 1,000,000,000 pounds of tobacco annually, have not asked for higher duties on Turkish tobacco. This is as logical as to state that Maine potatoes have not requested protection for Jersey pottery.

Beyond the common name "tobacco" there is no similarity between the two types of tobacco in the consideration of classification and protection. There is vast difference in type, yield, and method of preparation and consequent cost of production. For purposes of protection the difference in the two tobaccos is even greater than that existing between clean wool and grease wool, common rice and hard rice, long-staple cotton and short-staple cotton, shelled almonds and unshelled almonds. This the manufacturers themselves admit.

VARIETIES OF TURKISH-TYPE TOBACCO.

The manufacturers state that Turkish-type tobacco is of many varieties and give a list of names. They also state that the "Pall Mall" brand contains about "42 varieties of tobacco."

The names given by the manufacturers are nothing more than names of small villages comprising the district of Samsoun. These villages have more or less uncertain production of tobacco. The manufacturers gather their tobacco from any number of villages they can. These villages use the same type seed, and distances between villages are so short that it would be impossible for any village to produce a distinct type due to natural cross-pollination.

During and since the war the production of the Samsoun district has fallen to 25 per cent of normal. Nearly all of the villages named by the manufacturers have produced no tobacco since the war. If the production of all of these villages is essential to the manufacturers' blends, as they state to the committee, the consumers of the various brands have been given no explanation, much less a rebate, due to a deterioration of quality.

The statement about the "42 varieties" of tobacco in the "Pall Mall" brand may do well for advertising purposes, but it has no place in the records of a committee of Congress.

VARIETIES PRODUCED IN THE UNITED STATES.

The United States consumption of Turkish tobacco is confined to the four main varieties of Samsoun, Cavala, Smyrna, and Island. All of these are produced here.

STATEMENT OF DR. GARNER, OF THE DEPARTMENT OF AGRICULTURE.

The memorial's reference to Dr. Garner's statement is misleading. At no time has Dr. Garner made any pretense of possessing any usable knowledge on Turkish-type tobacco. We have discussed the subject with him and know his attitude. His statement that "California tobacco is California tobacco and nothing else," is correct and is in keeping with the department's policy of referring to American wrapper tobacco as "Connecticut or Florida shade grown," while in trade circles it is referred to and bought as "American Sumatra." California tobacco is California tobacco just as "Macedonian" or "Greek" tobaccos are Macedonian or Greek tobaccos and nothing else. The manufacturers refer to all tobaccos coming from the Near East as "Turkish" irrespective of the country of production. In the Near Eastern countries, however, they are known as "Turkish tobacco," "Greek tobacco," "Balkan tobacco," or "Russian tobacco," according to the country of production. They are all of the Nicotinum rusticum type, and the manufacturers accept them all as "Turkish."

During the early days of the wrapper-leaf development in Connecticut Dr. Whitney, of the Bureau of Soils, invited two prominent cigar-leaf dealers to examine two bales of tobacco. After careful examination both of these experts pronounced the bales to be good imported Sumatra wrappers. Upon being informed that one of the bales was tobacco produced in Connecticut they became very enthusiastic and congratulated Dr. Whitney on the department's success. Yet one of these gentlemen has appeared before committees of the Senate and the House during every hearing of tariff on wrapper tobacco insisting always that the American wrapper is not a competing article with the imported wrapper.

American-grown Turkish tobacco has had the same experience. We have tried our tobaccos on the manufacturers, including Mr. Herbert, president of the Philip Morris Cigarette Co., and Mr. Dixon, of the Tobacco Products Corporation. As early as 1913 Mr. Keeney, of the Keeney Bros., and one of the keenest judges of tobacco, pronounced the American-grown Turkish-type tobacco "every bit as good as the imported." Yet during the hearings before your committee Mr. Dixon was present to repeat the old tariff chant of "not a competing article."

It is not long since Macedonia, the largest producer of Nicotinum rusticum, took up the industry, starting with seed taken from Asia Minor. Long before the Macedonian production "Turkish cigarettes" were famous. Yet most of the Turkish tobacco consumed in the United States is not Turkish tobacco; it is Macedonian tobacco.

In the British Cape Colony of South Africa the industry began a few years ago by the accidental dropping of a few Macedonian seeds in the garden of a farmer named Stella. The seed had been sent to him by a friend in Macedonia as a curiosity. They now have an established industry, with production increasing every year. The colonial government has established demonstration farms in several localities and is giving every assistance within its power, including preferential tariff.

In southern Italy the industry was initiated by the Government tobacco monopoly. A recent report of the Italian director of agriculture states that it is aimed to be independent of the Macedonian imports in a few years.

In Palestine the industry was recently begun at the instance of the Government. Sir Herbert Samuel, British high commissioner of Palestine, recently reported that the cultivation of Turkish-type tobacco is expected to ultimately make large contributions to the revenues of Palestine.

"EXPERIMENT" OF THE AMERICAN TOBACCO CO.

The manufacturers speak of their "experiments" in California. That they know nothing about the growing of this tobacco is evidenced by the location of their farm and the quality of its soil.

Their "experiment farm" was a 20-acre ground located on the eastern edge of the middle San Joaquin Valley, 2 miles southeast of Exeter, Tulare County. It was conducted by the American Tobacco Co., not to experiment with the growing of this tobacco but to develop some method of curing and packing which would reduce, if possible, the cost of production. But they knew nothing of the problems involved.

Nothing short of utter ignorance of the conditions necessary for the raising of this tobacco could have led them to their 20 acres. Had the manufacturers known the conditions necessary for the production of this tobacco and the great diversity of soil and climate within the 700-mile stretch of California, they could not have failed to observe that on the lower slopes of the Coast Range Mountains from Ukiah to San Diego there is sufficient diversity of climate and the most unexcelled conditions to produce the entire world's supply of every variety of this tobacco.

A scientific discussion of the problems of Turkish-tobacco growing is not within the proper scope of this statement. The quality of the various grades of the tobacco grown in California is our answer to the manufacturer. There is no problem of quality. Our efforts must now be directed toward larger production and standardization of grading and packing. This could not be done in the face of an unprofitable and uncertain market brought about by lack of protection.

CONSUMER AND THE "BLENDS."

The memorial quotes from Mr. Aram's statement before your committee: "I do not think the buying public can tell the difference between third-rate and first-rate Turkish tobacco," but it leaves out the last part of the sentence, "to say nothing about tobacco of the same quality." We will overlook the fact that this is not a fair method of quoting. But the manufacturers know that statement to be true. Had they believed otherwise they would have hesitated to substitute during the war Chinese and Korean grown Turkish seed tobacco for some of the "42 varieties" so essential to their "secret blends."

The memorial suggests that the American farmers producing this tobacco have their normal and natural opportunity with the various new brands. It is not clear to us why a new brand of any manufacturer should begin with the handicap of higher-priced raw material when the imported leaf can be had for less.

Under abnormal conditions any commodity may be forced on the market at prices below cost. But no industry can continue under such conditions made permanent by inadequate tariff.

CALIFORNIA PRODUCTION DATA.

The California production data given to the Ways and Means Committee was prepared within a short time in order that our brief might be included in the printed record. We had not anticipated such haste and did not have our papers with us. We consulted our Congressmen, and they advised that in the absence of correct data we must be very conservative and allow our opponents every benefit of doubt. The information submitted to your committee was prepared later and after careful checking of all production data.

However, if the manufacturers doubt our production data they can verify same by offering to purchase the crops of 1919, 1920, and 1921. The Associated Tobacco Growers will be happy to convince them by giving them physical possession of the tobacco.

The memorial attempts to question our production costs. It is not necessary for the manufacturers to consider our data. They have in their files com-

plete data covering their own production costs in California through a period of several years. Although their data covers the low-cost prewar period only, it will serve its purpose. Why not submit this data to the committee?

Our valuation of land is correct. Our statement before your committee is also correct, and one does not contradict the other, as the memorial suggests. Much of this tobacco and all of the best tobacco is grown on slopes where there are gullies, ravines, steep banks, and other area not practical to cultivate. The purchase price of a parcel of land must be charged against the productive area only.

The gentlemen who wrote the memorial know how it came about that in spite of the fact that the farmers lost money on the 1918 crop the production in 1919 almost doubled. The manufacturers wanted the 1918 crop but had no intention of paying a fair price for it. But they also wanted to insure that there would be a larger production in 1919, so that should the war continue there would be available to them as much of this tobacco as possible to make up their depleted stocks. Their method of accomplishing the two ends with one stroke was a masterpiece worthy of their peculiar genius.

When the 1918 crop was ready for them in January, 1919, they professed to be ready to pay good prices for it but that their organization was so arranged that they could not take delivery until summer. Meanwhile they encouraged the farmers to go on with larger production. When, in June and July, 1919, the farmers learned the prices offered for the 1918 crop, it was too late to curtail the 1919 crop, which was already being harvested.

The only farmers who covered their cost of production during the war were those who produced the large-leaf, lower-grade types, as the differential between costs here and abroad is less in the case of these types.

There is no good Turkish-type tobacco grown anywhere in the world producing 941 pounds per acre, as the memorial states, citing a telegram from the College of Agriculture. The yield is from 250 to 600 pounds of cured tobacco per acre, according to variety. The average yield is between 350 and 4[illegible] pounds. But, like the tobacco grown in the Southern States and other products of the soil, this tobacco is subject to all the climatic and insect pest hazards incident to agriculture. The visible yield per acre is not the deliverable yield. Like other industries, the farmers must distribute the average loss or damage to crop for a given period of years and arrive at the average deliverable yield for that same period.

There are a few farmers in California who produced the Virginia-type tobacco, which yields high. Finding Turkish-type growing unprofitable, they turned their attention to this type. But conditions in California are [illegible] favorable to this variety. There is also produced a special variety for the manufacture of chemicals and insecticides exclusively. This yields unusually high. Our association is interested in Turkish-type tobacco only.

The telegram from the agricultural college makes no distinction in types. Some of the letters and telegrams from California submitted by the manufacturers are also explained by this fact. There is no usable knowledge on Turkish tobacco in the agricultural college or any other State agency. These agencies advised us to abandon the industry because "it can not succeed unless [illegible] Tobacco Trust wishes it."

The value of our tobacco given by the agricultural college telegram is [illegible] liquid value of the commodity. The gentlemen who wrote the memorial [illegible] the gentlemen who set the liquid value of any tobacco in the United States and also in the Levant.

Our testimony before your committee was clear on this point. Mr. Aram [illegible] not and could not give the equivalent of periodic employment in terms [illegible] permanent employment.

AVERAGE VALUE OF THE IMPORTED LEAF.

The average value of the imported leaf is not 91 cents per pound, as [illegible] memorial states. The United States Tariff Commission has the official d[illegible] and it shows it to be about 50 cents per pound.

The differential in production cost of this tobacco here and in the Levant is no greater than that of a great many products of American factories [illegible] farms enjoying protection. Neither do the manufacturers make any attempt to prove that the benefits of the low cost of the imported leaf are passed to the consumer.

CAN THE CIGARETTE INDUSTRY "SURVIVE" THIS TARIFF?

It may be, as the memorial states, "perfectly apparent, even to a layman, at no manufacturer can afford to use tobacco costing about $2 per pound * * in cigarettes that he sells at $4.06 per thousand, and which take on the erage 3.75 pounds of tobacco, even though only 20 per cent of it is of the ported type." But the above is not at all clear to anyone knowing tobacco d the manufacture of cigarettes. The facts are:

(a) There are no blended cigarettes sold in the United States using imrted tobacco at the average cost of $1 per pound.

United States official figures show the average value of the imported toreo to be about 50 cents per pound. Moreover, the better grades of tobacco e used in the making of "all Turkish" cigarettes, and only the lower grades e utilized in the blended cigarettes.

(b) There are no blended cigarettes sold in the United States requiring 3.75 unds of tobacco per thousand cigarettes.

All blended cigarettes are made in the "small size," having a consumers' ight of 2.5 pounds of tobacco per thousand. Allowing for waste in manuturing process, these cigarettes require an average of 2.75 pounds and never re than 3 pounds of tobacco per thousand cigarettes.

The 3.75-pound average given by the memorial is the manufacturers' weight r thousand cigarettes of the "regular" size, which have a consumers' weight 3 pounds per thousand. Only the high-priced all Turkish cigarettes are made the regular size.

COMPARISON OF PRICES HERE AND IN ENGLAND.

The memorial states: "It is true that in this country some pure domestic garettes are sold as high as 10 for 10 cents, but it is equally true that we e also selling in this country blended cigarettes containing an average of over per cent of Turkish tobacco at 20 for 20 cents."

The point is not that pure domestic cigarettes sell here as high as 10 for 10 nts. The memorial makes no effort to explain how it is possible for the itish manufacturer to sell cigarettes at the same price to the consumer as at paid by the consumers here if it is true that prices here are reasonable. ere is about 100 per cent differential in taxes against the British manufacrer. aside from other extra expenses, such as ocean transportation, etc. It also worthy of note that the majority of cigarettes sold in England are sold her by the American manufacturers through their factories in England or by mpanies having close relations with or subsidiaries of the American comnies.

The 20-for-15-cents cigarettes referred to by the memorial and also held out the committee by Mr. Parker as a shining example of the manufacturers' ncern for the consumers' welfare are explained by the fact that these garettes do not constitute a lowering of cost to the consumer. They are cheap garettes, made of cheaper tobaccos, and sell for a cheaper price. They are for-15-cent cigarettes and nothing more. And we doubt the existence of a gle manufacturer who will deny this fact under oath.

The following facts are worthy of consideration:

All blended cigarettes sold in the United States are artificially flavored.

In England none of our blended cigarettes or the 20-for15-cents cigarettes uld be sold, because there is a law against artificial flavoring and adulteran of tobacco.

In the United States all domestic-tobacco cigarettes when artificially flavored l for less than the blended cigarettes. But all domestic-tobacco cigarettes t artificially flavored sell for the same price or more than the blended arettes.

If the memorial is correct as to the average value of the imported type at per pound and the blended cigarettes, containing on the average 20 per cent this tobacco, how is it that all domestic-tobacco cigarettes when not artially flavored must be sold for the same price or more than the blended arettes, considering that the average value of domestic tobacco is about 30 nts per pound?

In view of this fact we can not escape the logical conclusion that one or veral of the following must be true: The manufacturers are purposely putting pure domestic-tobacco cigarettes beyond the reach of the average smoker stimulate the sale of blended cigarettes artificially flavored, or the blended

cigarettes do not contain domestic tobaccos of a tolerable quality, or th is something about this apparently innocent practice of artificial flavori persisted in by the manufacturers that brings the cost of blended cigarette the same level or below the cost of the pure domestic-tobacco cigarettes.

When the full facts about this apparently innocent practice of artific flavoring are appreciated, it will be seen that it is the manufacturers' str and cruel weapon to defeat the law of supply and demand in purchasing th domestic tobaccos. And this weapon is used against the American farmer the expense of the American consumer.

ABOUT PRICES IN ENGLAND.

The memorial admits that the "Pall Mall" cigarettes sell for a shilling England and a quarter here. It neglects to comment on the "Philip Morri cigarettes. While in the case of "Melachrino" those sold in England it cl to be smaller in size.

Also, upon examination of the manufacturers' statement, we find that shilling is taken at par value in the sale price, but at current exchange computing British taxes on tobacco.

The memorial goes on with a general and vague statement about the Ameri cigarettes sold in England being smaller in size and different in qual They should be more definite: Are the "Pall Mall," "Melachrino," "Ph Morris," and all other American cigarettes sold in England in identical b and labels different in quantity (size of cigarette) and in quality? If s manufacturers are guilty of misrepresentation to the consumer.

We repeat that all American cigarettes manufactured in their factorie England and sold there sell for the same price or less than they are sold the United States. And in no instance are they sold at a price to equal the consumers' price here and in England, considering the nearly 100 per differential in taxes in favor of the American consumer, a difference by means accounted for by a possible lower cost of manufacture in Eng Also all cigarette prices in England are about the same as those charged for the same quality tobacco used.

As to difference in taxes here and in England, no further comment is ne sary. Your committee can, no doubt, get at the facts through the expert its command.

The memorial does not believe "that any American manufacturer is 'c sciously' selling his product in foreign countries at a lower rate of profit t in this country."

The following example shows the facts: The "Herbert Tareyton" blended cigarette enjoying large sales. Until a few weeks ago the retail p in the United States was 20 for 30 cents everywhere. Recently it has sold 20 for 25 cents at some stores.

Following is a comparison of prices and taxes here and in Canada on 1 cigarettes of this brand:

United States:			Canada:		
Retail price		$15.00	Retail price		$1
Internal revenue	$3.00		Internal revenue	$6.00	
Import duty	.21		Import duty	1.20	
Total taxes		3.21	Total taxes		
After taxes		11.79	After taxes		1

Differential against the American consumer, $1.49 per 1,000 cigarette about 3 cents per package. Can it be that the manufacturer of this bra not "conscious" of the facts?

CONCLUSION.

The arguments of the manufacturers against an adequate protection to industry are the arguments of a powerful group maintaining a practical mo oly of the tobacco industry. The entire history of this group shows that it always fought bitterly, and with no fine distinction in its choice of wea against any measure threatening its hold on the supply of raw material or market for the manufactured product.

The American farmers engaged in the production of tobacco refuse to be pressed with the power of this or any other selfish group so long as the C

on of the United States, guaranteeing her citizens equality of opportunity, living force.

'e rest our case with your honorable committee, confident that the sound accepted principle of protection to American industry will prevail.

ALFRED ARAM,
President Associated Tobacco Growers of California.

DR. M. O. WYATT,
President Northern California Turkish Tobacco Growers' Association.

TEMENT OF CHARLES DUSHKIND, NEW YORK CITY, REPRESENTING THE TOBACCO MERCHANTS' ASSOCIATION OF THE NITED STATES.

ie Tobacco Merchants' Association of the United States is a national organion, with a membership of more than 1,480, full paid and in good standing, the leading tobacco concerns in the United States, consisting of cigar, rette, and tobacco manufacturers, leaf-tobacco growers and dealers, wholetobacconists, tobacco importers and exporters, related trades, and supply es, files this memorial protesting against any proposed increase in the tariff on Turkish tobacco.

ie House bill now being considered would increase the rates on filler tobacco 35 cents per pound, the rate which has obtained since 1882, to 45 cents per d, unstemmed, and from 50 to 60 cents per pound, stemmed, with a new iso that filler tobacco "commonly used without removing the stem," as all ush tobacco is used, shall be treated as stemmed tobacco; that is, shall bear te of 60 cents per pound, and that "filler tobacco of the kind known as dish" shall bear a rate of $1 per pound. This protest is against any and all ease, and is in insistence that the present rate of 35 cents per pound on dish tobacco is adequate.

OSED INCREASE IS NOT INTENDED FOR REVENUE PURPOSES—ANY INCREASE WOULD BE UNWISE.

the outset, we assume, Congress having but recently passed a tax bill out adding to the heavy taxes already paid on cigarettes, that the proposed ease in the tariff on Turkish tobacco is not intended to produce additional nue, but rather to protect some tobacco-growing interest.

owever, if the tariffs referred to are intended to increase revenue, then we ectfully urge that the taxes on the tobacco industry have already reached "point of diminishing returns," as is evidenced by a $40,000,000 drop in nue from tobacco in the last fiscal year.

e understand that the Treasury Department's experts so advised the Comee on Finance when the new tax measure was under consideration.

this connection we cite the case of England, where, in 1920, the tariff on rs was raised to secure £500,000 additional revenue. One year later the cellor of the exchequer, in submitting the 1921 budget, made this significant ment:

Last year my budget proposal included an ad valorem surtax of 50 per on sparkling wines and cigars. * * *

have now to admit that I was wrong. * * * These duties have failed ly to answer my expectations, and as levied at their present rate they are munerative. There is nothing at first sight more reasonable and nothing universally popular than a luxury tax. But the trouble is * * * if put heavy taxation upon a luxury people cease to indulge in it, and you lose ue instead of gaining it. * * *

estimated that the total receipts would be £1,360,000. The actual receipts been only £325,000. It is clear that the surtax lowered revenue instead of ac it and has entirely failed to justify itself."

e £325,000 collected under the additional surtax was about £475,000 less than mount collected during the preceding year under the old tax rate.

e surtax was promptly repealed, but not until the industry had been practi- destroyed.

THE INTERESTS INVOLVED.

nifestly, if one industry is to be protected at the expense of another, it is reasonable that we get a fair appraisement of the benefit accruing to the one he damage done to the other. The interests involved are:

California interests that seek prohibitive tariffs.

Number of farmers raising tobacco	3
Number of acres under cultivation	3 0
Maximum production of tobacco in peak year pounds	1,500,0
Tobacco on hand do	2,200,0
Alleged value of annual crop at $1.50 per pound	$2,250,0
Profits looked for at 25 cents per pound	$375,0

NOTE.—The above are the maximum figures taken from Mr. Aram's testimo which figures we believe to be grossly exaggerated.

The American cigarette industry that seeks to be saved from a ruinous tari an essential raw material.

Domestic tobacco used annually in cigarettes[1] pounds	150,000,0
Value of annual consumption of domestic tobacco (150,000,000 pounds at 41.4 cents per pound 1919 prices)	$62,100,0
Tobacco on hand, 3 years' supply pounds	450,000,0
Value of tobacco on hand (at 41.4 cents per pound)	$183,300,0
Acreage needed for cigarette tobacco (at 676 pounds per acre)	221,8
Imported tobacco used annually pounds	40,000,0
Value (before duty payment) of imported tobacco used at 91 cents per pound	$36,400,0
Duties on annual importations of cigarette tobacco	$14,000,0
Internal-revenue taxes paid annually on cigarettes	$150,000,0
Annual volume of business (consumers' prices) over	$500,000,0

The additional duties sought to be imposed at the rate of $1 per pound wo amount to $26,000,000; and at the rate of 60 cents a pound would amoun $10,000,000, if we are to assume the continued importation of 40,000,000 pou of Turkish tobacco per annum under the increased rate.

To protect what Mr. Aram claims to be a possible industry with a poss income of $375,000 a year he seeks further to tax the cigarette industry to extent of $26,000,000 a year; that is, to add that amount to the $150,000 of internal-revenue tax, and $14,000,000 of customs duties that the industry yields.

The fact is, of course, that the cigarette industry could not pay these a tional duties; that there would be disorganization of the industry and that $150,000,000 of internal revenue now being collected would be reduced by amount greater than the proposed tariff would produce.

WAR-TIME GREEK EXPORT DUTIES WERE NO FACTORS IN AMERICAN IMPORTS.

It is not true that there have been burdens heretofore imposed on the expo tion of tobacco by the Grecian or Turkish Government, which have latterly b lifted, so that the American cigarette manufacturers are able to bear the hea duties proposed by the House bill. It is true that for awhile during the war Grecian Government imposed some export duties. These were imposed du the time when it was almost impossible on account of a lack of shipping fa ties to secure Turkish tobacco from Greece at all. They were impose the spring of 1917, and were repealed in the fall of 1918. They formed a of the price paid by American manufacturers for their tobacco brought in f Greece. They were included in the average bond value of the Grecian tob landed at the port of entry in this country—and yet the average bond valu all the tobacco landed in 1917, during a part of which the said export duty tained, was 45.8 cents per pound. In 1918 it was $1.01 per pound; whe in 1919, when there was no such duty, the average bond value of all the Tu and Grecian tobacco imported was $1.077 per pound, and in 1920 it aver 91.5 cents per pound. We are informed that when, in 1918, the Grecian Gov ment determined to repeal this small export duty, it refunded to the expo the amount theretofore collected.

[1] The whole cigarette industry is involved in this matter, because if the propos be adopted, the industry would be disorganized by the shifting of blends and entities. It is true that of the 150,000,000 pounds of domestic tobacco annually u cigarettes about 104,000,000 pounds are used in the Turkish blended cigarettes; a only such would be affected, these figures should be revised accordingly.

RATIO OF IMPORTED TOBACCO USED IN BLENDED CIGARETTES.

The blends of the various brands of cigarettes are necessarily secret formulæ of the respective manufacturers. Hence there is no official data available showing the percentage of imported tobacco used in the various brands of cigarettes.

An official report of the War Industries Board entitled "History of Prices during the War—Prices of Tobacco and Tobacco Products," contains (on p. 8) official figures of the production of the various types of cigarettes in 1917. This report divides the three general types of cigarettes approximately as follows:

	Per cent.
Pure Turkish	7
Turkish blends	71
Pure domestic	22

The growth of the Turkish-blend brands of cigarettes has been principally during the last 10 years. The war seriously interrupted importations. But before the war there had accumulated considerable stocks of Turkish tobacco in this country. In the year 1913, for example, there was an importation of 31,000,000 pounds of Turkish tobacco as against a total cigarette consumption of only 15,500,000,000. The importation of Turkish tobacco in 1919 was 46,000,000, and in 1920, 39,000,000 pounds. Taking all in all, with shipping unimpeded and with no accumulated stocks, it is fair to estimate the present rate of consumption of Turkish tobacco at 40,000,000 pounds.

Taking the percentages of the War Industries Board, based upon a questionnaire issued by the board, and applying these percentages to the 40,000,000 pounds, our estimate of the consumption of Turkish tobacco, it appears that the Turkish tobacco in the Turkish-blend cigarettes is approximately 23 per cent of the whole. Of course, some blends contain less than 23 per cent and others more, but the average appears to be 23 per cent.

MR. ARAM'S CONTENTIONS AND THE REAL FACTS IN THE CALIFORNIA TOBACCO-GROWING SITUATION.

The imported types of cigarette tobacco are essential to the production of at least 78 per cent of the cigarettes consumed in the United States.

The imported tobaccos have greatly stimulated the cigarette business and vastly enlarged the demand for domestic tobacco. While importations of cigarette types of tobacco have increased from about 14,000,000 pounds in 1911 to 46,000,000 pounds in 1919, an increase of but 32,000,000 pounds, the aggregate quantity of tobacco used for cigarettes has grown from approximately 38,000,000 pounds in 1911 to 198,000,000 pounds in 1919, or an increase of 160,000,000 pounds (the complete figures for 1920 not being yet available).

American farmers, other than Mr. Aram and his alleged California "association," fully appreciate the benefit of the imported tobaccos as a means of increasing the demand for their home-grown products. Not one of the 300,000 farmers producing annually over 1,000,000,000 pounds of tobacco (exclusive of cigar types) has demanded, asked for, or even suggested any higher duties on Turkish tobacco.

But Mr. Aram claims that the tobacco raised in California is Turkish tobacco. Assuming, though it isn't true, that the California tobacco is as good as some of the types of Turkish tobacco, what about the great variety of types that they can not produce?

Supposing that a Pennsylvania tobacco grower should find a suitable spot in England where he could raise the Pennsylvania type of fillers, and upon the strength of that demand a prohibitory duty, not alone on the Pennsylvania type of tobacco but on all of the 20 or more distinctive types of American tobacco, what would be the answer to such a demand?

Turkish tobaccos, like American tobaccos, are divided into a number of distinctive types and each type is again divided into various dstinctive grades. To make a satisfactory blend a variety of types and grades must be used. For example, the Pall Mall brand contains as many as 42 different types or grades of Turkish tobacco.

For an illustration of this point, we refer to the "Samsoun type" of tobacco and submit a list of the various classes or grades of tobacco raised under that one general type, to wit: Tsarchamba, Kavak, Amassia, Hadjikeuy, Khavza, Ladik, Madjideuzu, Merzifoun, Vizis Kupru, Alatsam, Baffra, Erbao, Karahissar,

Endress, Messoudie, Sinope, Guerze, Ayandik, Boyadad, Yeni Khan, Guruk Char Kichla, Tokat, Nixar, Zele, Unia, Therme, and Fatza.

Each of the above is a distinct grade of tobacco, although they belong to the same general type known as "Samsoun." Similarly, other general types that are imported into this country, such as Smyrna, Cavalla, Xanthy, Salonicas, Thessali, Agrinion, all have a variety of grades or classes.

California growers may be able to produce good tobacco. If so, it will be distinctly California tobacco, and no other type. As Dr. W. W. Garner, of the Department of Agriculture, who is concededly the best expert on tobacco growing in this country, has put it, "California tobacco is California tobacco and nothing else."

Dr. Garner's opinion is borne out by world-wide experience. Very rarely do countries, widely separated geographically, produce the same type of tobacco, although they may seem to superficial or even careful observers to be strikingly alike in their soil or climate. The fact is, as testified by those familiar with much of the territory where Turkish tobacco is grown, and the California territory, that there are marked or vital differences. California has an abundant yet an irregular rainfall, whereas the rainfall in the Orient is frequent and gentle, seasonal and reliable. California has quick changes and wide extremes in temperature, whereas in the Orient such is not the case.

The American Tobacco Co. in 1908, 1909, and 1910, experimented in California, and the Liggett & Myers Tobacco Co. having in 1911 acquired the San Francisco factory of the American Tobacco Co., continued to experiment for several years thereafter in an effort to produce some sort of substitute for Turkish tobacco. From Mr. Aram's statements, in 1909 the American Tobacco Co., or some local California representative of that company, by circular encouraged California landowners themselves to continue the work. But these experiments absolutely failed.

The tobacco business in all its branches illustrates and proves the fallacy of the contention that identity of seeds means identity of product. Tobacco grown in the Southern States, from the same seed and in the same territory, varies from 65 cents a pound to 16 cents a pound; American shade-grown wrappers, grown by the same company in Connecticut, bring twice as much per pound as those grown from the same seed and by the same method in Florida or Georgia. Yet Mr. Aram desires us to believe that he can bring seed over from the Orient and produce in California every type and every grade of tobacco grown in Greece or Turkey, and that, with tariff protection, they could be easily and readily substituted by cigarette manufacturers for Turkish tobacco.

Mr. Aram's point of view in this regard is shown by a sentence in his testimony before the Finance Committee:

"I do not think the buying public can tell the difference between third rate and first rate Turkish tobacco."

Apparently he builds his whole case upon this supposition, which requires no comment. Surely the cigarette manufacturers, who have developed a business of 50,000,000,000 cigarettes a year, must have learned that the consuming public can tell the difference or they would have put into their cigarettes nothing but domestic tobacco instead of using high-priced imported tobacco and paying a duty thereon besides.

The suggestion by Mr. Aram that large cigarette manufacturers have some sinister motive in not using California grown tobacco in substitution for Turkish tobacco is absurd. None of the cigarette manufacturers owns an acre of Turkish ground; none of them is enamored of doing business in Turkey; none of them has any interest other than the securing, without embarrassment and at fair cost to it, of raw material for its product. Most of the large manufacturers have well-established brands whose sales amount to billions of cigarettes annually. Some of the large manufacturers have experimented at some time with California tobacco, and none of them has found it satisfactory. None of them dare substitute it for the Turkish tobacco in any of their valuable and well-known brands.

California tobacco growers, if they have a product that is usable in cigarettes, have always their normal and natural opportunity to establish their tobacco with the numerous new brands being constantly gotten out by small manufacturers. In the last year or two they have had an unusual opportunity, if their tobacco had merit, because in the last year or two many of the strong, well-known tobacco manufacturers, such as The Bloch Bros. Tobacco Co., of Wheeling, W. Va.; Larus & Brother Co., of Richmond, Va.; John J. Bagley Co., of Detroit, Mich.; Scotten Dillon Co., of Detroit, Mich., have

ne into the cigarette business with ample capital, and with experienced acco men. Undoubtedly every one of them is making a blended cigarette. idoubtedly also they could have bought the 1919 and 1920 crop of Calirnia tobacco, which Mr. Aram says none of the large dealers would buy, substantially less than they had to pay for their Turkish tobacco. Why in't they in making new blends for their new cigarettes try the California acco?

UR REQUIREMENTS OF TURKISH TOBACCO AND THE PRODUCTION OF CALIFORNIA TOBACCO.

As against our average requirements of about 40,000,000 pounds of Turkish acco per annum, the largest crop, according to Mr. Aram's latest figures, ever duced in California, was that of 1919, which amounted to 1,525,000 pounds. rely 1,500,000 pounds can not meet a requirement of 40,000,000 pounds. But have reason to doubt Mr. Aram's figures. We rather believe that the figures it he submitted to the Committee on Ways and Means are less wide of the rk than those he now presents. Here are the two sets of figures:

	Mr. Aram's figures submitted to the Senate committee.	Mr. Aram's figures submitted to the House committee.		Mr. Aram's figures submitted to the Senate committee.	Mr. Aram's figures submitted to the House committee.
	Pounds.	*Pounds.*		*Pounds.*	*Pounds.*
	500	500	1914	245,000	
	9,500		1915	500,000	
	30,000		1916	800,000	
	37,000		1917	498,000	
	300,000	300,000	1918	870,000	
	490,000		1919	1,525,000	1,000,000
	250,000		1920	700,000	200,000
	215,000		1921	48,000	

However, both of these statements seem to be wrong. On August 24 last we ed the College of Agriculture, Agricultural Experiment Station of California, follows:

May we not ask you to furnish us with such data, information, or statistics you may have in regard to tobacco growing in your State?"

The following is the reply:

California tobacco acreage 1919 was 700 acres. Quantity harvested, 489 to pounds. Value, $284 to $166.

"EDWIN C. VOORHIES."

t will thus be seen that in 1919, instead of raising 1,000,000 pounds, accordto Mr. Aram's first statement, or 1,525,000 pounds, according to his most ent statement, there were cultivated only 700 acres, producing between 489 41 pounds per acre, or a total of 658,700 pounds, according to the maximum ld. Taking the mean figure, the yield would only amount to 500,500 pounds. ince Mr. Aram has failed to give the source of his information, we must, of rse, accept the official figures from the authoritative source referred to.

The insignificance of the industry is further shown by letters and records ted in the appendix hereto.

ENT DUTY ON TURKISH TOBACCO AFFORDS MORE THAN A SUFFICIENT DIFFERENTIAL TO PROTECT CALIFORNIA TOBACCO.

otwithstanding Mr. Aram's varying statements as to the prices paid for kish tobacco, which at one point of his testimony he mentioned as 15 to 30 ts per pound, contradicting himself with equal emphasis in the latter part his testimony, where he stated that what he meant was that the cost of proing tobacco on the other side was 50 cents per pound, the official records of customhouse department (Foreign Commerce and Navigation Reports) show the average price paid for Greek-Turkish tobacco, even under the declinprices in 1920, was 91.5 cents per pound, besides a duty of 35 cents, which gs it up to $1.265 per pound.

But Mr. Aram claims that it cost $1.34 per pound to produce tobacco in California, and he submits pages of detailed figures purporting to show the itemized cost of production in substantiation of his assertion.

Mr. Aram does not give the source of these figures. However, it is entirely unnecessary to enter upon a discussion of the figures submitted by him except to refer briefly to one or two outstanding facts which throw much light on the subject.

For instance, among the items of "Permanent investments" he gives the value of 20 acres of land at $6,000, which equals $300 per acre. In his testimony before the committee, in response to Senator Reed's question, he stated that the tobacco land in California is worth "from $100 to $250 an acre", also that the land "is not good for anything else except grazing."

Apparently when Mr. Aram prepared that statement he overlooked the fact that Californians sold their 1918 crop at a time when, according to his own statements, the manufacturers bought everything they could get at prices ranging between 25 cents and $1.25 per pound. The farmers were seemingly so happy over it that the following year, to wit, 1919, as appears from his own figures, they nearly doubled their crop. Surely, if the farmers had lost money on the 1918 crop at $1.25 per pound (maximum price), they would have held back in raising tobacco again in 1919, instead of doubling their crops.

Yet Mr. Aram desires to make us believe that it cost $1.34 per pound to produce tobacco.

His cost statement is based on a production of 302 pounds per acre, but here again Mr. Aram seems to be in error, for it appears from the telegram of the California Agricultural College herein above quoted that the yield is from 489 to 941 pounds per acre, and that the value of the crop is from $156 to $284 per acre, which makes from 30 to 34 cents per pound.

Mr. Aram is careless in his figures. This was clearly demonstrated in his testimony before the committee when, in response to Senator Reed's question, he testified that there are employed an average of 9,000 laborers for a whole year to cultivate and produce the California tobacco crop. But when he was asked how 9,000 laborers can be paid from the proceeds of a crop the entire output of which, even at $1.25 per pound, would be about $875,000, he explained: "I do not know what these men will get, but our association is conducted in this way," following it with a recital of the methods of his association. This was the only explanation he could give for his statement. To pay 9,000 laborers involves a cost of $2,700,000, figuring at the rate of $1 per day.

With the average price paid for Turkish tobacco at 91 cents per pound, plus a duty thereon of 35 cents per pound, the California tobacco, whatever it may be, is more than sufficiently protected.

The highest average price paid for cigarette tobacco grown in the United States during war days was 41.3 cents per pound; while the average price for tobacco imported from Greece and Turkey, even under the present declining market, is 91 cents per pound, and to that must be added the duty of 35 cents per pound, making an average price for the imported tobacco, $1.26 per pound.

Manifestly, if they can not produce tobacco in California to compete with Turkish tobacco costing $1.26 a pound, while the average highest price that domestic cigarette tobacco was ever sold for was only 41.3 cents per pound, they can not produce any tobacco on a commercial basis, for it must be self-evident that if the cost to produce such tobacco is prohibitive it can not be used as a commercial article.

Producing an article is one thing, and producing it on a commercial basis is quite another thing.

The great bulk of Turkish tobacco is used, not in the manufacture of pure Turkish cigarettes, but in the Turkish-blend cigarettes, i. e., the cigarettes that retail to the consumer at 20 for 20 cents and are sold by the manufacturer at $7.06 per thousand, which includes the internal-revenue taxes, or $4.06, which excludes the internal-revenue taxes.

It must be perfectly apparent even to a layman that no manufacturer can afford to use tobacco costing about $2 per pound (which would necessarily be the approximate cost under the proposed increased tariff), in cigarettes that he sells at $4.06 per thousand and which take on the average 3.75 pounds of tobacco, even though only 23 per cent of it is of the imported type.

Reference has been made at the hearing to "Pall Mall" and "Egyptian Deities." These are the most expensive and the highest type of Turkish cigarettes made in this country. Their sales are, however, comparatively so small that they practically form no factor in the business on pure Turkish cigarettes

which amounts, approximately, to three and one-half billion per annum, or 7 per cent of the whole.

The great bulk of the pure Turkish business is done on such brands as "Lord Salisbury," which retail at 15 for 16 cents; "Turkish Trophies" (cork tips), "Helmars," and "Egyptian Prettiest," the retail price of which is 20 for 25 cents; "Melachrinos (No. 9)," "Moguls," and "Murads," which are sold to the consumer at 20 for 35 cents, but not "Pall Mall" or "Egyptian Deities."

The average manufacturer's price for pure Turkish is about $11 per thousand, which includes $3 internal-revenue taxes and about $1.20 per thousand in duties on imported tobacco used therein, or $6.80 minus the taxes and duties, which, as will be seen, figure at about 62 per cent of the manufacturer's net price.

MR. ARAM'S COMPARISON OF ENGLISH AND AMERICAN PRICES.

Mr. Aram repeatedly claims that American cigarettes are sold in England at lower prices than they are sold for in this country, although the taxes in England are higher than in the United States.

To substantiate his statement, he tells us that a cigarette made of pure Virginia tobacco sells in England at 10 for 10 cents. It is true that in this country some pure domestic cigarettes are sold as high as 10 for 10 cents, but it is equally true that we are also selling in this country blended cigarettes containing an average of over 20 per cent of Turkish tobacco at 20 for 20 cents, the maximum price, the same cigarettes being sold in some stores as low as 20 for 15 cents.

But Mr. Aram has overlooked the fact that there are not less than three national brands on the market now, such as "One-Eleven," "Beechnut," and "Sunshine," that are retailed at 20 for 15 cents, for which the manufacturers receive a net price, minus the taxes, of but $2.30 per thousand.

Laying special emphasis on his assertion that the American brand "Melachrino" cigarettes are sold in England for 1 cent a package less than they are sold for in this country, he has ignored the important fact that the "Melachrino" cigarettes that are sold in England are made in England and not in this country.

Another most significant fact that he did not seem to recognize is that the cigarettes made in England or those made in the United States for the English market are substantially smaller in size and take nearly a pound of tobacco less per thousand than those sold in the United States. This means a difference not only in the cost of tobacco, but as the English taxes are levied at so much per pound, whether on raw tobacco or on the finished product, a difference of 1 pound of tobacco or thereabouts means a difference of about one-third of the taxes on a thousand cigarettes.

As a matter of fact, the tax on Melachrino cigarettes, plus the duty on the Turkish tobacco used therein, made in this country, amounts to about $4.10 per thousand, while the duty on the tobacco in the same cigarettes made in England amounts to 21 shillings, or about $4.20 in American money. There is no tax on the cigarettes, other than the duty paid on the tobacco, in England.

Furthermore, the price of Melachrinos in this country is not higher than the price in England, for they sell in the United States at from 15 to 20 cents a package, whereas in England they sell at a minimum of 1 shilling per package.

Pall Mall cigarettes are a high-class pure Turkish cigarette of insignificant volume as compared with the whole cigarette business in this country. In this country the brand belongs to the American Tobacco Co. In England the same brand belongs to the Imperial Tobacco Co. It so happens that a good many cigarette brands well known in this country are owned by an entirely different proprietor in England and certain other foreign countries. Naturally the manufacturer in England uses such blends and formula as he sees fit, and the English cigarette is habitually of lighter weight and generally of different blend than the American cigarette of the same name.

The American Tobacco Co. furnishes a few—not exceeding one-half million a year—Pall Mall cigarettes to the Imperial Tobacco Co. for sale at places frequented by Americans in London, simply and only for advertising purposes. The prices obtained by the English company, who takes them from the American Tobacco Co. at cost, is entirely unimportant to the American Tobacco Co.

We do not believe that any American manufacturer is consciously selling his product in foreign countries at a lower rate of profit than in this country. Normally and because of the high tariffs in foreign countries on imported manufactured goods there is no considerable export business on American-made cigarettes. There are two temporary situations that should be taken

into account; one is that during and just after the war there was a large exportation from America of cigarettes of well-known American brands, and on a basis of profits entirely satisfactory. The American Tobacco Co., for instance, states to us that it exported in the calendar year 1920, 1,404,000,000 cigarettes and that its total exportations in the calendar year 1921 up to December 1 was only 68,787,000. A second consideration is that if Mr. Aram, or even a more reliable investigator, made inquiry as to brands in London and other European cities to-day he would be likely to find Pall Mall selling as low as 6d. and other cigarettes on a proportionate basis. This is due to the sale at auction by foreign Governments of the surplus stocks of depreciated goods on hand as the result of overpurchases for war purposes.

The increased duties were inserted in the House bill without hearing the cigarette manufacturers and without affording them an opportunity to present the real facts in the situation to the committee.

As stated by Mr. Parker before your honorable committee, and as admitted by Mr. Aram in his testimony, Mr. Aram did not appear at the public hearing before the Ways and Means Committee when the tobacco section was scheduled to be heard, nor had the cigarette industry received any intimation of Mr. Aram's activities until his memorandum was accidentally discovered by the writer printed in the miscellaneous appendix, Part VI of the hearings (p. 4439).

It is our firm belief that had the cigarette industry had an opportunity to present the real facts in the situation before the Committee on Ways and Means or its subcommittee in charge of the tobacco schedule the fallacy of Mr. Aram's contentions would have beeen conclusively established and the old tariff rates on imported cigarette tobacco would have remained unchanged.

CONCLUSION.

We believe that it has been clearly demonstrated:

That Turkish tobacco has been of great benefit, not only to the cigarette industry, but to the domestic tobacco-growing industry.

That no substitute for the Turkish types of tobacco can be raised in California, or in any part of this country.

That the increased duties passed by the House can not but spell disaster to our cigarette industry.

That aside from Mr. Aram, who claims to speak for an alleged California Tobacco Growers' Association, no American tobacco grower has asked for additional protective duties on Turkish tobacco, or on any other filler tobacco.

And we respectfully urge with all possible emphasis at our command that the great American cigarette industry, with investments of many millions of dollars, using about 150,000,000 pounds of domestic tobacco grown by American farmers, and contributing $150,000,000 a year in internal-revenue taxes alone, should not be jeopardized, and that its immensely valuable trade-marks and property rights should not be destroyed simply for the purpose of affording protection to a few farmers who have been unsuccessfully experimenting in raising a substitute for Turkish tobacco in the State of California.

On behalf of the more than 1,480 members that we represent, and on behalf of 200 smaller cigarette manufacturers who manufacture practically nothing but pure Turkish cigarettes, we most earnestly protest against the increased duties provided in the House bill.

APPENDIX TO STATEMENT OF TOBACCO MERCHANTS' ASSOCIATION.

QUOTATIONS FROM LETTERS.

From a letter of Mr. W. H. Alston, president of the Alston Tobacco Co., who has been engaged in the Turkish leaf tobacco business for the past 21 years both as an importer and as a buyer of Turkish tobacco for some of the largest American manufacturers:

"Shortly after the purchase and manufacture of Turkish tobacco was inaugurated, experiments were started in various States of the Union in an endeavor to produce similar types. To this end, Turkish tobacco seed was brought to the States and I was instrumental in having experienced tobacco farmers cultivate tobacco grown from this seed in Pennsylvania, Ohio, Maryland, Kentucky, North Carolina, and Virginia. I was particularly interested in these experiments, being a native-born North Carolinian. The results, however, were

very disappointing and may be summed up without exaggerations thus: In no instances did the highest grade of tobacco produced in this manner in any of these States equal in quality the lowest grades of tobacco grown in Turkey.

"At this point, it should be emphasized that the lower grades of Turkish tobacco are not imported into the States, being themselves quite unsuitable for American manufacturers.

"The proportion of tobacco grown in Turkey entirely unsuitable for American usage is at least 40 per cent, but we consider even these qualities as being very much superior to any substitute Turkish tobacco capable of being produced in this country.

"In 1908 I was instrumental in carrying out experiments for a similar purpose in California. An attempt was made to reproduce Turkish tobacco grown from Turkish seed in California, a farm having been leased in Exeter, Calif., with the idea of producing a quantity of about 40,000,000 pounds. I was then associated with the American Tobacco Co., and the latter company spent a considerable amount of money on this experiment, and personally I superintended the execution of this plan. It was our idea to spare neither expense nor trouble in the endeavor to produce 'Turkish' tobacco in the States, thereby to avoid the necessity of establishing a large and necessarily expensive organization in the Near East.

"The result of the experiment was certainly more fortunate than those conducted in the other States mentioned heretofore, but the fact still remained that the highest quality produced in California was not equal to the lowest grades of Turkish, which themselves are considered of too inferior a quality for the American market.

"The climate of California is unsuitable for the cultivation of Turkish tobacco because, briefly, the extremes are too pronounced.

"When it is dry, it is too dry, and resort has been had to irrigation, which is itself unnatural, and is unsuited to tobacco cultivation. After the tobacco is cured and in storage, the rainy season is so pronounced that the tobacco is in continual 'soft' order with the result that mold develops.

"It may be pertinent at this point to introduce a few facts regarding Turkish tobacco and the California substitute. There are at least 25 different types and grades of the so-called Turkish tobacco imported into the United States not to mention quite as many more which do not come to this country, but are consumed in Greece and Turkey and in different countries in Europe and elsewhere. The 25 grades imported to the United States are each distinctive and when blended together make the finished Turkish cigarette. When the blend of Turkish tobacco is itself blended with domestic tobacco, then you have what is known as the Turkish blend cigarette. Substitute Turkish tobacco grown in various parts of the United States, California included, grades, I should say, into about three qualities only. Even these three qualities are very similar. Is it not obvious therefore that one can not make as satisfactory a blend with three grades (all more or less a sameness) as is possible with no less than 25 types, each one quite distinctive?"

In a recent letter of the Liggett & Myers Tobacco Co., one of the largest users of Turkish tobacco in this country, the company has made the following statement:

"In the year 1911, the American Tobacco Co. furnished Turkish tobacco seed to a few farmers, Armenians or Greeks, as I recall, residing in the hill section of California between Sacramento and San Francisco, and gave them instructions as to the cultivation and curing of the tobacco. A percentage of the tobacco raised from that seed, although of coarse texture, had a Turkish flavor. It was decided therefore to continue the experiment and this was undertaken by the John Bollman Co., a branch of Liggett & Myers Tobacco Co., located at San Francisco. From 1912 to 1918 we purchased a total of approximately 150,000 pounds of this tobacco. We became convinced that the soil there was not adapted to the cultivation of Turkish leaf; that the variation in temperature falling as much as 30 or 40° at night as compared with the temperature in the middle of the day prevented the tobacco from ripening and curing properly. Its texture was coarse, it was lacking in Turkish flavor, was of poor burning quality and in many instances of decided rankness. We could use with some risk only about 1 per cent in a cigarette in which several different varieties of tobacco were blended. Experts do not believe that Turish tobacco can be grown successfully in that climate. After the tobacco was supposed to have been air cured, it had to be dried in a machine in order to prevent its

complete damage. The experiment was costly to us and we decided that under all the circumstances, it was best to discontinue it."

The Gensior Tobacco Co., another concern for many years engaged in the business of importing Turkish tobacco on a large scale, has this to say in a letter recently written to us, to wit:

"We purchased several thousand pounds of this tobacco at 30 cents a pound for one late large cigarette company in this country who decided to try this tobacco with Turkish for the same reason of saving the duty, and found same to be unsatisfactory, leaving them with most of this tobacco on hand at the present time.

"We were offered about a million pounds or more of this tobacco at 50 cents, which we rejected, and which is now still lying in New York in the hands of one Armenian by the name of Aram, who has since approached us several times to make him any kind of a reasonable offer to try to work this off for them on any basis that we might suggest, and we have declined this also, because there is no demand for this character of an inferior substitute for Turkish tobacco at any price. With all of this so-called Turkish California lying in New York and the scarcity of good Turkish tobacco, we can not dispose of this California tobacco.

"Some of the Armenians who raised this California Turkish came here and persuaded some little manufacturers, leading them to believe that Turkish California can be mixed with the genuine and thus save the duty and make a 100 per cent Turkish cigarette. This leads to the public being misled and fooled into a mixed Turkish for pure Turkish and charging the price as if it were all Turkish, which is, of course, wrong. Turkish tobacco at any price could never be substituted by California tobacco."

Mr. Aram, in attempting to magnify the extent of what he calls the tobacco-raising industry in California, mentions the following counties where tobacco has been produced, to wit: Yolo, Fresno, Tulare, Santa Clara, San Joaquin Kings, Sacramento, Los Angeles, and San Diego.

In 1917 we made extensive inquiries as to the production of tobacco in California, and we quote herein from letters received from the Department of Agriculture and chambers of commerce in the various counties where Mr. Aram claims that tobacco is being raised, which speak for themselves:

SANTA CLARA COUNTY.

[From the Consolidated Chamber of Commerce of the city and county of Sacramento Nov. 15, 1917.]

"This tobacco was grown in the counties of Tulare, Santa Clara, and Fresno, also Los Angeles, but at the present writing it has not been of sufficient commercial value to continue.

"The county of Sacramento raises absolutely no tobacco, not because of the adaptability of the soil but owing to the fact that other crops of a commercial value can be raised instead of the tobacco."

TULARE COUNTY.

[From the United States Department of Agriculture, Bureau of Plant Industry, Washington, D. C., Nov. 5, 1917.]

"In reply I may say that considerable interest was aroused by experiments carried out a few years ago in Tulare County, Calif., looking to the production of Turkish tobacco. We understand that these experiments were furthered by the John Bollman Co., of San Francisco. More recently tests have been made in the States of Washington and Oregon and also in California, with a view to growing tobacco merely as the source of spraying material required by orchardists in combating destructive insects."

[From the United States Department of Agriculture, Bureau of Crop Estimates, San Francisco, Calif., Nov. 15, 1917.]

"A few years ago considerable Turkish tobacco was grown in the San Joaquin Valley, Calif., I think largely in Fresno and Tulare Counties, but so much trouble was experienced in marketing the same that its cultivation was discontinued."

KERN COUNTY.

[From the Kern County Board of Trade, Bakersfield, Calif., Dec. 4, 1917.]

"Replying to your recent communication, I wish to advise that there are a number of places in Kern County where they are raising tobacco in an experimental way or for their own use. There is no tobacco raised here commercially."

SAN DIEGO COUNTY.

[From the San Diego Chamber of Commerce, San Diego, Calif., Dec. 27, 1917.]

"Answering your favor of December 14, in reference to the raising of Turkish tobacco in this section, will state that three years ago a gentleman from Turkey, interested in growing Turkish tobacco in this section, brought some Turkish tobacco seed to this chamber. The seed was distributed to interested farmers in the back country. Endeavoring to promote the production of the tobacco a prize was offered for the best sample submitted. A few experimented that year, and of the samples submitted one won a prize of $10.

"Since that time the matter seems to have gone by default, as we have been unable to learn of any parties who are growing the tobacco in this section now."

LOS ANGELES COUNTY.

[From the United States Department of Agriculture, Bureau of Crop Estimates, San Francisco, Calif., Jan. 12, 1918.]

"I inclose herewith copy of letter from Mr. J. D. Culp, which is self-explanatory."

[Letter of J. D. Culp, Pacific Grove, Calif., Jan. 11, 1918.]

"There are only two parties that I know of that grew any. Mr. J. M. Goode, whose address is Rodondo, Los Angeles County, raised a small quantity, and Mr. Lesher, Thirty-eighth and Moneta Streets, Los Angeles, has raised a small quantity for the past two years, and he has it on hand now. He sent samples of it to the different tobacco markets back East, and couldn't obtain any offer for it at all. It is not fit for commercial use. It is like all other tobacco that ever has been grown in California, that has been cured by the same methods that are used in other tobacco-growing States of the Union."

KINGS COUNTY.

[From the Kings County Chamber of Commerce, Hanford, Calif., Nov. 19, 1917.]

"It was raised a few years ago, but for the lack of a market it was only raised one year."

STANISLAUS COUNTY.

[From the Modesto Chamber of Commerce, Modesto, Calif., Nov. 23, 1917.]

"* * * beg to advise that several years ago there were experiments carried on in the raising of tobacco in the city of Turlock, this county, but the same did not prove successful on account of the flavor of the tobacco."

FRESNO COUNTY.

[From the California Development Board, San Francisco, Calif., Nov. 27, 1917.]

"* * * a few years ago an attempt was made to grow Turkish tobacco in San Joaquin Valley, particularly in Fresno County, but for some reason the activity has greatly decreased and we do not believe at this time that it is being grown commercially."

WRAPPER, FILLER, AND SCRAP TOBACCO.

[Paragraphs 601-603, 605.]

STATEMENT OF HON. DUNCAN U. FLETCHER, UNITED STATE SENATOR FROM FLORIDA.

Senator FLETCHER. Mr. Chairman and gentlemen, I have onl short statement to make in connection with this matter. I am sati fied that I shall not unnecessarily take the time of the committe by reading a short letter which will supplement the statement of M Pendas, whom I will introduce in a moment and who will discu the subject in greater detail, based on his extensive experience an knowledge.

I wish to direct your attention to paragraph 601, Schedule 6- Tobacco and manufactures of.

I hope the committee will allow me to refresh their memories as t the existing law and to compare that with the proposed law in H. 7456.

Under the act of 1909, Schedule F, paragraph 220, we find th following:

> Wrapper tobacco, and filler tobacco when mixed or packed with more than 15 p centum of wrapper tobacco, and all leaf tobacco the product of two or more countr or dependencies when mixed or packed together, if unstemmed, $1.85 per poun if stemmed, $2.50 per pound.
>
> Filler tobacco, not specially provided for in this section, if unstemmed, 35 cents p pound; if stemmed, 50 cents per pound.

Then paragraph 224 reads:

> Cigars, cigarettes, cheroots of all kinds, $4.50 per pound and 25 per cent valorem, and paper cigars and cigarettes, including wrappers, shall be subject to t same duties as are herein imposed upon cigars.

That is the act of 1909. The act of 1913 is the same. No chang is made in either act in respect to these matters I have mentione

The emergency tariff act of March 27, 1921, did make a change wi reference to wrapper tobacco and filler, so that the wrapper tobac and filler tobacco when mixed or packed with more than 15 p cent of wrapper tobacco, and all leaf tobacco, the product two or more countries or dependencies when mixed or pack together, if unstemmed, $2.35 per pound; if stemmed, $3 per poun Under the act of 1913 the duty if unstemmed was $1.85 per poun and if stemmed $2.50 per pound, but under the emergency tar act the duties now are $2.35 per pound if unstemmed and $3 p pound if stemmed.

There were no changes as to the duty on cigarettes, cigars, an cheroots in the act of 1909 and none proposed in the bill now bef you, paragraph 605. It is practically the same as paragraph 2 under the act of 1909 and paragraph 185 under the act of 1913.

In H. R. 7456 it is proposed to make the duty on wrapper t bacco and filler tobacco when mixed or packed with more tha 50 per cent of wrapper tobacco, and all leaf tobacco the produ of two or more countries or dependencies when mixed or pack together, if unstemmed, $2.10 per pound; if stemmed, $2.75 p pound; instead of $1.85 per pound and $2.50 per pound, respective as carried in the act of 1909 and the act of 1913, and $2.35 per poun and $3 per pound, respectively, as carried in the emergency tar act.

The item known as Turkish tobacco has no corresponding provision in the acts of 1909 and 1913.

Also, the emergency tariff bill makes no change with reference to "filler tobacco, not specially provided for in this section," and it is still carried in the emergency tariff bill, as in the acts of 1909 and 1913. The bill now before you proposes to make a change in that item so that it will read:

> Filler tobacco not specially provided for, if unstemmed, 45 cents per pound; if stemmed, 60 cents per pound: *Provided*, That filler tobacco, not specifically provided for, commonly used without removing the stem shall be subject to the same duty as stemmed.

Manufacturers of Havana cigars in Tampa, especially, are insisting that these duties ought not to be raised beyond the acts of 1909 and 1913. Concretely, they contend this, and urge it upon the committee: First, that such duties as are carried in the emergency act of 1921, or the House bill now before you, will cause a decrease of importation and a consequent loss of revenue; secondly, that it will cause at least a partial shutting down of factories and the throwing of people out of employment. There are engaged in this work, in the cigar industry in Tampa, some 15,000 people, while in Key West there are some 5,000 so engaged. They feel sure that this will make the Havana cigars so costly that the consumers will be limited in number, the demand diminished, and the industry seriously injured, if not ruined. They point to an experience which Mr. Cuesta informs me about. I have not seen the law, but my information is that in 1920 England added a 50 per cent ad valorem tax on the existing taxes, with the result that whereas 50,000,000 cigars had been imported from Cuba to England the year before, following this additional 50 per cent ad valorem tax only 2,000,000 cigars were imported that year or the year after, so that England has been obliged since then to repeal that additional tax. That is one experience which I think perhaps ought to have some weight with this committee.

Senator McLEAN. That was the duty on the imported Havana?

Senator FLETCHER. Havana; yes, sir.

I am speaking not from the standpoint of a representative of the manufacturers or the dealers or the producers, but from the standpoint of the public generally and as a citizen.

Mr. Peter O. Knight has written me a letter which I wish to submit to the committee as coming from a citizen thoroughly informed on the subject. He says:

> I regret exceedingly that I shall be unable to be present at the hearing of the tariff schedule before the Senate Finance Committee December 7.
>
> Mr. Pendas and I last summer were requested by the Clear Havana Cigar Manufacturers' Association and the Tampa Board of Trade, of this city, to be present at the hearing when it should be held; and, as you know, I held myself in readiness for two months during the summer to attend the hearing; but this particular schedule did not come up for consideration and the matter was then deferred, and it will now be impossible for me to go.
>
> I am quite sure that when the members of the Finance Committee thoroughly understand this situation, instead of increasing the duties on the raw material they will decrease the same.
>
> As you know, the manufacturing of clear Havana cigars in the United States is of comparatively recent growth. Years ago all of the clear Havana cigars were manufactured in Cuba, and there were not consumed in this country over 40 or 50 million of clear Havana cigars annually. Finally, by reason of a tariff ball passed, such a duty

was fixed on the raw material as compared to the duty on the manufactured article s that the manufacturer could import into this country from Cuba Cuban tobacco manufacture it into cigars, thus making a clear Havana cigar in this country, and sell the same cigar for 10 cents that could not be made in Cuba and sold in this country for 15 cents. And so on. The result was the building up of the clear Havana industry in Tampa and in Key West, particularly. To such an extent has this industry grown as that there is now manufactured in Key West approximately 60 or 70 million cigars annually, and there has been manufactured in Tampa as high as 400,000,000 clear Havana cigars annually; whereas the province of Habana in Cuba has never exceeded in production 220,000,000 clear Havana cigars annually. And there are imported into this country now from Cuba not very many more clear Havana cigars than were imported into this country before the clear Havana industry in the United States started. So the passing of this particular tariff bill was a magnificent piece of constructive work.

During the last few years, however, because of conditions existing, the internal revenue tax has been increased enormously, the tariff has been increased on the raw material to such an extent as that the clear Havana manufacturer in this country is unable now, with the present internal revenue and customs taxes, to manufacture clear Havana cigars that can be sold by the retailer at two for 25 cents.

Now, during the last few years, when the laboring man received $40 a minute and business men of very ordinary capacity made several hundred thousand dollars per annum, it was an easy matter for the manufacturer to pay the tax and to sell the cigars for 20 and 25 cents a piece, because the people were on a magnificent drunk and cared not what they spent and paid for their cigars. But now that we are getting back to sane conditions, they are unwilling and unable to pay such prices for cigars. And the result is that, with the present tariff and internal revenue taxes, the clear Havana industry is moving along in this city at only about 50 per cent production, and even though, commencing April, 1920, there was a 10 months' strike and the manufacturers here were unable to produce any cigars scarcely, and the shelves of the retailers of the United States were absolutely clear of Tampa cigars when the industry resumed operations the beginning of this year. Unless the tariff on the raw material and internal revenue taxes are reduced so as to place the clear Havana manufacturing industry in this country on the same basis that it existed prior to the war, it is my opinion that the production of clear Havana cigars in this country will be reduced one-half, for the reasons above stated. The people, as a rule, can not pay 15 cents for a cigar; and that is what they must do at the present time if they are going to buy clear Havana cigars made in Tampa or Key West—from 15 cents up.

If the tariff is increased, as proposed in the bill, the effect will be most disastrous. It will probably place the manufacturer in this country where he will be unable to make a clear Habana cigar that the retailer will be able to sell for less than 20 cents. How many people in the United States will spend 20 cents for a cigar? With the tariff increased as proposed in the pending bill, you will put the manufacturer in Cuba and the manufacturer in this country on such a parity as that the manufacturer in Cuba will be able to sell his cigars in this country at probably the same price that the manufacturers in this country will have to sell their cigars for. And you know the smokers of clear Havana cigars have an idea that a Havana cigar can only be made in Habana; and if, therefore, they can buy a cigar made in Habana for the same price as a cigar made in Tampa, they will buy the cigar made in Habana.

Now, this industry has paid enormous taxes to the Government annually, the taxes in Tampa alone amounting to several million dollars a year, and the industry here has gone under full steam for about 20 years.

For what purpose is this measure passed? Is it to aid the manufacturer and enable him to continue in business? And is it to enable the Government to raise increased revenue? If that is the purpose of the bill, then, as above stated, the tariff should be decreased and not increased.

The present tariff on filler is 28 cents a pound net; and on wrapper, $1.88 a pound. It is perfectly absurd to say that the grower of domestic tobacco should receive more protection than this. As a matter of fact, domestic-grown tobacco, as a rule, is not worth 28 cents a pound for filler or $1.88 a pound for wrapper. The manufacturer here must pay not only 28 cents duty for filler and $1.88 for wrapper, but in addition thereto the price that he pays to the grower in Cuba for the tobacco, plus the amount of freight from Cuba to the United States. So, from any standpoint, proper protection to the domestic grower of tobacco, protection to the clear Habana manufacturer to enable him to continue his business in this country, and necessary revenue to the Government, the present Federal taxes, internal revenue, and customs on the raw material should be reduced. If it is not reduced, the tax on the manufactured article should be increased.

Tampa is now a thriving city of seventy-odd thousand people, built up by the cigar industry. You, of course, may know the consequences to the city and its

abitants if the industry is destroyed or seriously affected. The people here are uch concerned with reference to this matter; but I have full confidence that, when e honorable members of the Finance Committee understand this situation, they ill take no action that will injuriously affect any industry in this country.

Mr. Knight is well acquainted with all the details of this industry nd has been in touch with it for some 20 and odd years. He is gentleman of the highest standing.

Senator SMOOT. Do you think that 10 cents a pound increase is oing to destroy that business?

Senator FLETCHER. Do you mean as proposed by this bill on filler tobacco, not otherwise provided for"?

Senator SMOOT. Yes. It is such a small amount.

Senator FLETCHER. That it is the smallest increase proposed and he least serious but that amounts to a very considerable sum, enator, and the manufacturers are running now on about half me.

Senator SMOOT. But that is better than a good many of the other usinesses of the country are doing.

Senator FLETCHER. Well, it is a pretty serious thing for them, nd they claim that they can not continue. Certainly they can not ontinue anything approaching their normal capacity because the eople will not pay the increased price that will be necessary. That crease would add $2.10 per thousand to the cost of the cigars.

Senator SMOOT. The emergency tariff bill is 50 cents.

Senator FLETCHER. Yes; I realize that.

Senator SMOOT. This is taking off 10 cents from the emergency ariff.

Senator FLETCHER. It is less than the emergency tariff, but the mergency tariff bill is too severe.

Senator McLEAN. You are addressing yourself to the filler?

Senator FLETCHER. To the filler—"not otherwise provided for."

With reference to the wrapper, Florida has a very important instry in the growing of wrappers. This wrapper and the Connectit wrapper compete with Sumatra and Java but very slightly with e Havana. The duty on the Havana wrapper, one way or the her, does not affect them so much, because the importation of avanas is negligible as compared with the wrapper generally. The al competitors are the wrappers from Sumatra and Java. Our ople in Florida feel that their competitors are Sumatra and Java d not Havana, as far as the wrapper is concerned, so that there is conflict in the claim that the duty should not be raised on "wrapr tobacco and filler tobacco when mixed or packed with more than per cent of wrapper tobacco," coming from Cuba, but should be ntinued as in 1909 and 1913. Whatever the duties which may be posed upon Sumatra and Java wrappers, the duties on Cuban appers and fillers ought not to be increased over 1913, but lowered. matra and Java alone are the real competitors of our growers— t Havana.

Senator McLEAN. I understand you have no objection to the rate the wrapper as contained in the emergency bill if confined to Java Sumatra?

Senator FLETCHER. If it can be separated so that it will not cover Havana wrapper.

Senator McLEAN. Of course, the Havana wrapper gets 20 per cent.

Senator FLETCHER. I see no reason why the bill should not specify Sumatra and Java wrappers and eliminate the Havana wrapper entirely. It should be eliminated from that classification.

Senator McLEAN. Isn't the Sumatra wrapper also grown in the Southern States—Georgia?

Senator FLETCHER. Yes; in Florida and Georgia.

Senator McLEAN. Isn't it used to wrap the high-grade cigars filled with Havana?

Senator FLETCHER. Yes; that is true, and the increased importation of the Havana filler will help the producer of the domestic wrapper, because the more Havana cigars are made the more demand there will be for the wrapper.

Senator McLEAN. Provided he can raise the tobacco at a profit.

Senator FLETCHER. Yes. One of the best informed men, I assume, in the country is Mr. Pendas, of Tampa, who has been for 40 years engaged in this industry. He is present, and I shall ask Mr. Pendas to come forward and present his view to the committee. Mr. Pendas, will you proceed with your statement in regard to this matter?

I want to ask the committee to let me file a brief, furnished by Mr. K. I. McKay, a distinguished attorney, for the manufacturers in Tampa, who is here to be heard if you have time, but is willing to have his argument incorporated in the hearings.

The CHAIRMAN. It will be so ordered.

BRIEF OF K. I. McKAY, REPRESENTING THE CIGAR MANUFACTURERS' ASSOCIATION OF TAMPA, FLA.

The tendency of Congress always has been to impose a higher rate of taxation on luxuries than on necessities. No one can justly complain of the propriety of the disposition of Congress in this respect. However, there are certain commodities which, while in their true sense they are not absolute necessities of life, yet by reason of their constant use by a large proportion of the people, are to a great extent regarded as necessities. This class of commodities, no doubt, for the purpose of raising revenue to defray the necessary expenses of government, should be taxed at a higher rate than those commodities that are in a strict sense recognized as necessaries of life, but it is manifestly wrong to tax a commodity that is universally used and contributes to the comfort and happiness of the people, even if it is not strictly a necessity of life, to such an extent as to place it beyond the means of the average citizen. It is also manifestly unfair for the Government, after following for many years a policy of taxation upon an industry that has made it profitable for men to invest their money in it and devote their time to it, to radically change the policy in such manner as to render the further conduct of the industry unprofitable and thereby cause serious loss to those who have invested their capital in it and made it a lifework, so that if it now becomes unprofitable to continue it they will not only suffer loss of their investment but will be deprived of the only occupation they are especially trained to follow.

Prior to the year 1885, the manufacture in the United States of cigars from imported Cuban tobacco was an industry not very extensively engaged in. The factories making this class of cigars in the United States were principally located at Key West, Fla., and New York City. Due to constantly recurring labor troubles encouraged and made possible by the concentration of a large number of workers in the industry at a single place at great distance from any other place where the industry was extensively engaged in, it became evident that it would be necessary to remove at least a part of it from Key West. With that end in view, certain manufacturers who had previously operated their factories at Key West investigated various locations and finally decided to establish their factories at Tampa, which was at the time a small village of not over 2,500 population. In course of time other factories came to Tampa from Key West, others that had been established in various cities of the North, realizing the advantages of Tampa's climatic conditions, nearness to the source of production of raw material, and to the available supply of skilled labor in making this particular class of goods, removed to Tampa, and in course of time other factories were established, until, within a few years, Tampa became the chief center in the United States for the manufacture

facture of clear Havana cigars by the Spanish hand method. The industry is largely responsible for the development and growth of Tampa in commercial importance. It has now become a city of 75,000 to 80,000 inhabitants, and is one of the most important southern ports of the United States.

The growth of the industry, both in quantity of production and in importance as a producer of revenue to the Government, is shown by the following table of figures taken from the official records of the internal-revenue office and customhouse at Tampa, covering the years 1901 to 1920, inclusive:

Years.	Internal revenue.	Customs receipts.	Cigars manufactured.	Years.	Internal revenue.	Customs receipts.	Cigars manufactured.
1901	$[illegible],110	$[illegible],400	147,220,000	1911	$910,430	$[illegible] 72	283,380,000
1902	442,751	1,220,984	141,906,000	1912	854,728	1 38	273,495,000
1903	510,[illegible]	1,318,531	167,030,[illegible]	1913	894,870	1 [illegible]	286,145,000
1904	[illegible],212	1,801,100	196,981,[illegible]	1914	856,565	1 15	267,966,000
1905	[illegible],124	1,604,626	220,430,[illegible]	1915	930,225	1 [illegible]	285,836,000
1906	861,480	1,794,467	277,082,[illegible]	1916	1,011,[illegible]	1 [illegible]	312,465,370
1907	885,340	1,667,600	285,060,000	1917	1,314,076	1 [illegible]	352,080,104
1908	791,040	1,561,280	236,061,000	1918	1,884,[illegible]	1 70	308,072,626
1909	901,578	1,891,636	257,030,000	1919	2,408,821	1 70	422,795,019
1910	[illegible],515	1,377,202	201,405,000	1920	2,028,[illegible]	71	226,042,[illegible]

The years 1910 and 1920 were subnormal, owing to protracted strikes which materially reduced the production of cigars in the factories, and correspondingly reduced the revenue paid the Government.

Substantially all of the internal revenue and customs receipts shown in the above tabulation were paid by the cigar industry on importation and manufacture of tobacco. It is impracticable to separate the internal revenue and duty paid by other commodities but if it should be done, the amount would be found negligible in comparison. It will therefore be seen that the Government revenue collected at Tampa during the past 20 years, almost exclusively from tobacco importation and cigar manufacture, has amounted in internal revenue to $20,828,232, and customs duties to $32,582,093, a total of $53,410,325. The enormous increase in internal revenue paid in proportion to the number of cigars manufactured during the years 1918, 1919, and 1920 should be noted. This feature will be commented upon later in this brief. It is safe to say that if the tobacco industry of Tampa is not handicapped by adverse legislation, but is given reasonable encouragement and fair treatment by the Government, as soon as normal trade conditions are restored throughout the country, the Government may safely count upon the cigar industry of Tampa to produce an average annual revenue for it of approximately $6,000,000. On the contrary, if the industry is seriously handicapped by unwise legislation, as is threatened, not only will the manufacturers suffer personally, and not only will many of the 15,000 highly skilled employees, who are customarily given profitable employment in the Tampa factories, be without the means of earning a livelihood, but the Government itself will suffer a very substantial decrease in revenue, and the proposed increase in duty, instead of producing additional revenue to the Government, will be the means of depriving the Government of a very substantial part of the revenue it now enjoys from the industry.

During the years 1917, 1918, 1919, and part of 1920, conditions in the tobacco industry were, as in all other industries, very abnormal. The price of raw material advanced on certain grades of Cuban tobacco as much as 400 per cent. The cost of boxes, lithographing, and every other item of material going into the production of the finished statutory package correspondingly increased. Labor in this industry had to be treated no differently from labor in all other industries. The result was that all, and substantially more, than the profit the manufacturers had, prior to these abnormal times, been accustomed to make in their operations, was absorbed in the cost of production, and it became necessary for certain advances to be made in the price of the goods. Cigars being a luxury, however, it was not practicable to advance the prices upon them in keeping with the advanced cost of production, and while it is difficult to estimate, it is safe to say that the average advance made by the Tampa manufacturers on the list prices of their goods during the period of excessive prices that until recently had prevailed in this country, did not exceed 35 to 40 per cent on the prewar prices.

Inability of the manufacturers to sell their product at these increased prices under present conditions has forced them to largely discontinue these advances and in many instances they are now forced to make a price to their customers substantially the same as it was before these increases were put into effect.

Prior to the beginning of the conditions that have so disturbed the industry, cigars were subject to an internal-revenue tax of $3 per thousand, which was paid by affixing internal-revenue stamps to the statutory package. Under the present revenue law this tax has been very substantially increased. The existing internal-revenue law requires the manufacturer to attach classification stamps to the boxes in which the cigars are packed according to the price at which the cigars are to be ultimately retailed, as follows:

Class A. Cigars retailed at 5 cents or under, $3 per 1,000.
Class B. Cigars retailed at 5 cents to 8 cents, $6 per 1,000.
Class C. Cigars retailed at 8 cents to 15 cents, $9 per 1,000.
Class D. Cigars retailed at 15 cents to 20 cents, $12 per 1,000.
Class 3. Cigars retailed at 20 cents and up, $15 per 1,000.

The present internal-revenue law is a serious handicap to the cigar manufacturer over and above the amount of revenue tax he is required to pay. If he finds that he is losing money upon a certain size or kind of cigar that he is producing, and in order to continue its manufacture he is compelled to raise the price $2 or $3 a thousand, which increase is passed on by the jobber to the retailer, the retailer finds that in order to handle the cigar at a profit he must raise the retail price at which it is sold to his customers. This raise in retail price forces the cigar into a higher classification under the internal-revenue law and subjects it to an additional tax of $3 per 1,000, which tax the manufacturer is required to pay. The result is if the manufacturer raises his price $2 a thousand, and because of the same the cigar is forced into a higher retail-priced class, he is required to place an additional $3 per 1,000 revenue stamp on the cigars, his increase of $2 per 1,000 results in an actual loss to him of $1 per 1,000, or, in other words, in order to raise the price $2 per 1,000 to cover added cost of production he is compelled to increase the price $5 per 1,000, which increase in many instances renders the cigar unsalable because of prohibitive price.

The average retail prices of cigars throughout the United States have become fixed by long-established custom, and it is extremely difficult for a retailer to make any substantial advance in the retail price of any well-established brand of cigars. If he does so, he drives away his trade on that particular brand. If he can not sell the cigar at an advance in price and his margin of profits on the previously prevailing price is only fair, as it must of necessity be in order to enable him to meet competition, he can not stand an increase in price from the manufacturer under such conditions. The result will be that as the manufacturer can not continue to make cigars and sell them to his trade without a profit or at a loss, his factory will be shut down, he will lose his investment, his employees will be out of employment, and the Government, by prohibitive taxation, will have killed the goose that has been laying for it the golden egg.

Prior to the abnormal conditions that disturbed the cigar industry in common with other industries, approximately 80 per cent of the cigars manufactured in the Tampa factories were of the kind that retailed at 10 cents and two for 25 cents. The present cost of material and labor and other supplies, as well as the advanced internal-revenue taxes, the manufacturer is now required to pay, have made it impossible for any cigar manufacturer in the United States to produce a clear Havana cigar that can be sold at retail for 10 cents, but the manufacturers realize that in order to continue in business and stimulate the sales of their higher-priced goods, upon which they can make some profit, they must make a cigar that can be sold at a price within the means of the average smoker, or in other words a cigar that will retail at not exceeding two for 25 cents. After a most careful calculation the clear Havana manufacturers of Tampa have determined to put such a cigar on the market and they have been supplying it to the trade for the past several months.

The cigar so made costs $90.50 per 1,000 to produce, including revenue taxes and other incidental expenses leading up to the production of the completed package. They have found it impossible to obtain from the jobbers a higher price than $[illegible] per 1,000 for this cigar. In other words, the jobbers can not pay more than this price for this cigar and sell it to the retailers at a price which will enable them to retail it at two for 25 cents. This being the cheapest clear Havana cigar produced by the manufacturers, it necessarily follows that the bulk of the production of the factories will be cigars of this class. The manufacturers are therefore confronted with an absolute loss of $7 per 1,000 on the largest part of their production under present conditions. They are prepared to meet this loss at this time and continue in business, hoping for a better day, and trusting that they may, by charging reasonable prices for the higher sizes that will be consumed by people who are able to pay for them, to a certain extent minimize this loss. Any increase in duty on the raw material that will add an average of $2.60 per 1,000 to the cost of this cigar will prevent the manufacturers from producing it. The result will be that the proposed increase

in tariff will make it necessary for the clear Havana manufacturers of Tampa to discontinue the production of a class of merchandise that now constitutes the larger part of their output. If these cigars are not produced, the manufacturers will not require the raw material. It will not be imported, and the expected revenue from the duty on tobacco to this extent at least will not materialize.

Proof that the retail price of cigars can not be substantially raised during normal times without destroying the trade is found in the fact that for the first five months of the year 1921, during which time the advanced prices made necessary by abnormal conditions have prevailed, the production and sale of cigars in the United States has fallen off 22 per cent, as against the corresponding period for the year 1920. This may be due in part to the fact that many people who formerly consumed cigars are out of employment, and therefore unable to buy them at any price, but it is undoubtedly true that a large percentage of this loss of trade is due to the fact that because of the reduction of income of the average citizen in this period of readjustment he is unable or unwilling to pay the price which the manufacturer is compelled under existing conditions to ask for his cigars, whereas the readjusted income of the average citizen would enable him to continue buying and using his favorite brand of cigars if he could purchase the same at the price prevailing prior to the increase in cost of production that has been forced upon the manufacturer by abnormal conditions and increased taxation prevailing during the past several years.

It must also be remembered that the cigar industry of Tampa is in a very depressed condition, caused by a strike that closed practically all the factories from April 14, 1920, to February 5, 1921, during which time the trade connections of the Tampa factories were broken and substitute merchandise found its way in large quantities into the hands of dealers. It is now necessary for the trade of the Tampa factories to be rehabilitated, and under conditions that are peculiarly adverse, for not only is the present cost of raw material and other elements of production, including taxation, substantially more than when the trade of these factories was first built up, but many Tampa factories have on hand hundreds of thousands of dollars' worth of material heretofore purchased at abnormal prices, which they were unable to use up during 1920 on account of the strike, and which because of present conditions they will have to manufacture and dispose of at heavy loss. This condition alone may mean bankruptcy for some.

An illustration of the working of the tariff and internal revenue laws as they affect the clear Havana cigar industry may at this point be aptly given. Cuesta, Rey & Co. operates one of the largest and best established clear Havana cigar factories in the United States. It is located at Tampa. This factory maintains a scientific cost accounting system, the accuracy of which has been proven by the test of years of use. This factory makes a certain size of cigar which is known in its system as size 36. The following are the figures furnished on the production of this cigar, according to the cost-accounting system above referred to:

Filler (21.6 pounds of stemmed filler, at $1.60 per pound)	$34.56
Less credit for scrap	.70
	33.86
Wrapper	12.60
Wages to cigarmaker	21.00
Internal-revenue stamps (class C)	9.00
Boxes (to hold 50 cigars each)	3.10
Labels and bands	1.15
Packing	1.90
Banding	.50
Salesmen's commission, customer's discount, and 1 per cent for advertising	10.50
Executives, office salaries and expenses, factory foremen, and expenses including repairs, insurance, trucking, etc	8.85
Total	102.46
Net selling price	105.00
Estimated net profit	2.54

The cost of filler and wrapper tobacco shown on the above tabulation includes the duty under the Underwood Tariff Act of 1913, after giving credit for 20 per cent Cuban reciprocity: the existing emergency tariff act, inasmuch, as it is only a temporary measure, being disregarded in this brief. Neither are the figures in the foregoing tabulation based on the cost of tobacco purchased at the high market. They are based on the cost of this year's crop of tobacco, which is substantially less. They

are also based on the minimum of wages according to a reduced schedule that the manufacturers have recently been forced to put into effect, and which the workers, recognizing the necessity, have accepted as just. The highest price at which any jobber will or can purchase cigars and resell them to the retailer, at a price that will enable the retailer to retail them for 15 cents each, is $105 per thousand. Any increase over that price forces the jobber to add to his price, which in turn forces the retailer to make an addition to the price that will cause the cigar to be sold for above 15 cents. The proposed increase of 25 cents a pound on wrapper and 10 cents a pound on filler above the tobacco schedule in the act of 1913, is in effect an increase of 20 cents a pound on wrapper from Cuba and 8 cents a pound on filler from Cuba, because of the Cuban reciprocity treaty. This increase of duty, as applied to the cost of the production of this particular cigar, will result as follows:

Additional duty of 20 cents per pound on 5 pounds of wrapper	$1.00
Additional duty of 8 cents per pound on 21.6 pounds of filler	1.73
Net increase of duty	2.73

This is 19 cents more than the $2.54 net profit as shown by the above tabulation. The cigar being one that is designed for sale at 15 cents, and the price of $105 per thousand being the maximum at which a manufacturer can sell that class of cigars, an addition to the manufacturer's price of sufficient to take care of this increased duty will force the jobber to raise the price to the retailer and the retailer to raise the price to his trade, but the moment the retailer raises the price on this cigar above 15 cents it is thrown in class D under the internal-revenue law, and is forced to pay $3 additional revenue tax, and therefore this increase of $2.73 in duty on the tobacco that goes into the making of a thousand of these cigars in reality imposes an additional tax of $5.73 per thousand on the manufacturer. The trade will not stand this increase. The result will be that if this increase goes into effect, the manufacturer will be forced to discontinue the production of this cigar.

The following tables show the average amount of duty and internal revenue paid on a thousand cigars manufactured during the years 1917, 1918, 1919, 1920, and the first six months of 1921 by Cuesta, Rey & Co. and the Habana-American Co. branch of the American Cigar Co., and during the years 1919 and 1920 by Celestino Vega & Co., three of the principal clear Habana factories of Tampa:

Cigars produced, average amount of duty, and internal revenue paid.

CUESTA, REY & CO., TAMPA, FLA.

Year.	Cigars produced.	Duty paid.	Internal revenue.	Total [illegible]
1917	10,405,582	$99,415.26	$36,540.13	[illegible]
1918	9,343,695	90,263.00	54,095.69	[illegible]
1919	8,537,407	90,307.21	72,449.64	[illegible]
1920	3,019,349	24,731.87	35,125.00	[illegible]
1921	2,812,715	14,713.29	29,503.71	[illegible]

HABANA-AMERICAN CO., BRANCH AMERICAN CIGAR CO., TAMPA, FLA.

1917	11,543,293	$103,947.52	$14,9[illegible]	[illegible]
1918	10,140,176	83,866.40	60,178.82	[illegible]
1919	9,185,293	81,753.63	85,017.93	[illegible]
1920	4,592,731	36,001.31	38,277.23	[illegible]
1921	4,313,959	50,281.67	47,444.40	[illegible]

CELESTINO VEGA & CO., TAMPA, FLA.

1919	6,850,765	$46,422.74	$60,022.71	[illegible]
1920	2,073,248	18,483.13	21,112.54	[illegible]

The proposed increase in tariff, with its attendant forcing the cigars produced into a higher classification under the existing internal revenue law, will impose aggregate Federal taxes on cigars produced by the clear Havana factories at Tampa of approximately 30 per cent of the gross price at which the cigars are sold by the manufacturers.

rate of taxation that is probably not imposed upon any other industry of any size in the country, whether it is engaged in the production of necessities or luxuries.

It requires, and by existing internal-revenue regulations the Government allows, 25 pounds of unstemmed tobacco to produce 1,000 cigars of the average size, although many manufacturers in Tampa find at the end of the year that the cigars produced by them have consumed substantially more than that average of tobacco per thousand, and they are annually required to pay additional revenue tax on an apparent shortage of cigars produced and accounted for as compared with the tobacco consumed, or furnish evidence to the Government that the cigars produced consumed more than 25 pounds per thousand. To produce the average size cigar requires approximately 5 pounds of unstemmed wrapper and 20 pounds of unstemmed filler. The duty on this tobacco, under the tariff act of 1913 was as follows:

5 pounds of wrapper at $1.85	$9.25
20 pounds of filler at 35 cents	7.00
	16.25
Less 20 per cent reciprocity	3.25
Net duty	13.00

Under the tariff proposed in schedule 6 this duty would be as follows:

5 pounds of wrapper at $2.10	$10.50
20 pounds of filler at 45 cents	9.00
	19.50
Less 20 per cent reciprocity	3.90
Net duty	15.60

This would be an increase of $2.60 duty on the raw material that goes into making each thousand of clear Havana cigars. This is substantially more than the average profit now made by clear Havana cigar manufacturers of Tampa, and, in fact, it is more than the average profit that was made by these factories per thousand cigars made by them prior to the disturbed trade conditions that have resulted from the war, and as shown, if the manufacturers are forced to increase their selling prices sufficiently to take care of this increased duty on raw material, they automatically force their goods into a classification under the internal revenue law that imposes an additional increase in taxation of $3 a thousand, which results in placing the manufactured article at a price at which it becomes unsalable.

This statement has practical proof in the experience of Great Britain. Prior to April, 1920, Great Britain imposed a duty of a shilling an ounce on cigars. In April, 1920 that country increased the duty on imported cigars by adding an ad valorem tax of 50 per cent. The consumers could not or would not pay the price the dealers were forced to charge after paying this increased duty, and the importers found it necessary to immediately cancel all orders they had placed with the Habana factories. It is history in the cigar industry that shortly after April, 1920, many of the cigar factories in Habana and other parts of Cuba were practically shut down and have since been producing almost entirely for local consumption, and that exports of manufactured cigars from Cuba since that time have been negligible. Previous to the imposition of this heavy additional duty, Great Britain was the chief importer of cigars manufactured in Cuba, but during the period from July 1 to December 31, 1920, the importation of cigars from Cuba to England was only 2,000,000. The Government recognized that the tax imposed had resulted in the destruction of a substantial source of revenue, and repealed it, but the trade has become disorganized and it will probably be many years before it can be rehabilitated to the proportions existing prior to April, 1920.

The same proportionate loss of revenue from duty on tobacco from Cuba may be expected if any further duty is imposed upon the raw material, for the reason that the manufacturers can not pay for the material and the cost of production and the additional taxes and sell their cigars at a price that will enable the retailer to sell them to the consumer at a price within his reach, or that he is willing to pay.

Moreover, the country owes a very real duty to Cuba, especially in its present financial distress. The finest tobacco grown anywhere is raised in Cuba. This is due to soil and climatic conditions. To protect the integrity of the crop, Cuba prohibits the importation to the island of any other tobacco or seed of tobacco. It is the second product of Cuba in importance. Any advance in duty that will reduce the consumption of this raw material in the United States will do great injury to the Cuban tobacco growers, and will add to the distress and chaotic conditions now existing in that country.

EFFECT ON DOMESTIC TOBACCO GROWERS.

Owing to the high cost of Cuban wrapper, many manufacturers have of late been producing what is known as the Connecticut shade-grown wrapped cigar. [illegible] of the best established brands in the country are of this kind. This cigar is produced by placing a wrapper of Connecticut shade-grown tobacco on a clear Havana filler. The growing of tobacco in Connecticut is a large industry. It represents an extensive investment of American capital and affords employment to many American citizens. If the manufacturer can not afford, on account of excessive tariff on Cuban filler tobacco, to continue making cigars of this class, a distinctive branch of the cigar industry will be destroyed, and the Connecticut tobacco grower will suffer. Connecticut shade-grown wrapper tobacco on account of the development of the Havana filled Connecticut shade grown wrapped cigar as a branch of the cigar industry, has advanced in price during the past five or six years from as low as $1.75 to as high as $5.50 a pound. During all the years that tobacco has been grown in Connecticut, the demand for it was so limited that the price was kept at about the low level indicated.

Since the enormous development of the Havana-filled, Connecticut-shade-grown wrapped branch of the cigar industry, the demand for Connecticut wrapper tobacco has become so great as to increase the prevailing price as above stated. It necessarily follows that if the manufacturer of this grade of cigars can not profitably continue its manufacture because of the prohibitive cost of the filler that goes into it, the demand for the Connecticut wrapper will fall off and the price of Connecticut wrapper to the trade will recede in keeping with the demand for it.

Cuban tobacco is used not alone in clear Havana and shade-grown wrapped cigars, but this is especially true of filler. Many manufacturers, due to the present high rate of taxation, are forced to use a substantial quantity of domestic tobacco in the production of their cigars. This is done by blending the Cuban filler with domestic filler and wrapping the cigar with Connecticut shade-grown, Florida shade-grown, or imported Sumatra or Java wrappers. The cigar so produced satisfies many smokers, although it is not as fine in quality as the cigar made entirely from Cuban tobacco. A cigar produced entirely from domestic-grown tobacco is usually unpalatable and will not satisfy the average American smoker.

Over 670,000,000 cigars are manufactured in Ohio annually and 40,000,000 pounds of cigar leaf are annually grown in that State and marketed all over the country. This leaf tobacco is used largely for filler. A good share of it is blended with Cuban filler, and a large portion of it is used in Sumatra or Java wrapped cigars. Ohio tobacco is regarded as a very good domestic filler, but it is only because of the smoother taste and sweeter aroma and better appearance acquired by the finished cigar through the judicious admixture of foreign-grown leaf tobacco that the production of Ohio cigar leaf has reached the figure of 40,000,000 pounds annually, and that the production of Ohio cigars has extended itself to 670,000,000.

Wisconsin binders are almost invariably used in the manufacture of what is known as cigars of the seed and Havana or blended type. The less foreign-grown filler and wrapper tobacco we use, the less Wisconsin binder tobacco we use. No informed person will claim that the present production of Wisconsin tobacco of 60,000,000 pounds per annum would ever have reached half that figure or will ever again approximate that quantity under taxation that will render the use of imported tobacco for blending therewith unprofitable.

Pennsylvania produces annually approximately 2,100,000,000 cigars, or about [illegible] per cent of the production of the entire Nation. This State also produces 55,000,000 pounds, or 25 per cent, of all the cigar leaf annually raised in the United States. A cigar made entirely of Pennsylvania tobacco is not the kind that satisfies the taste and requirements of the average smoker, but when blended with Habana tobacco and wrapped with a Sumatra or Java wrapper is in large demand. Pennsylvania tobacco does not make fine wrapper. It is chiefly suitable for filler and binder. If a certain percentage of Cuban filler is not available to blend with Pennsylvania tobacco the demand for Pennsylvania cigars will be materially affected and the Pennsylvania tobacco grower will correspondingly suffer.

PROPOSED INCREASE IN DUTY ON SCRAP FROM 35 CENTS TO 55 CENTS PER POUND

Tobacco known to the trade as "scrap" is the cuttings, trimmings, and small particles of the leaf that accumulate from working up the leaf into the long filler cigars. This scrap is used to blend with domestic leaves in making up filler for the cheaper grades of cigars. It would seem illogical to impose a tariff of 45 cents a pound on filler tobacco and 55 cents a pound on scrap, which is merely the by-product salvaged from working up the filler and wrapper leaf. As above stated, this scrap is used

largely in the manufacture of cigars from domestic tobacco blended with imported Cuban tobacco, and the same argument advanced with respect to the effect on domestic tobacco growers of an increase of the tariff on filler tobacco applies with equal force in opposition to this increase in duty on scrap.

The experiment of raising the duty on scrap tobacco was tried in the Payne-Aldrich Tariff Act of 1909. Under that law the duty on scrap tobacco was fixed at 55 cents a pound, with the result that the importation of scrap tobacco was speedily reduced to negligible proportions. Should this experiment again be attempted at this time, there can be no doubt whatever that it would operate merely to curtail revenue now derived from the scrap tobacco, reduce the quality of the moderate-priced cigar of good flavor, and substantially decrease consumption and production, thus decreasing the internal revenue from this class of goods, as well as the aggregate duty collected on scrap tobacco under the present tariff law.

The figures given in this brief as to internal revenue and customs duties paid at Tampa, the average aggregate of internal revenue and customs duties per thousand cigars paid by manufacturers, the cost of production of cigars of the class designed for retail sale at 15 cents each, and the application of the existing internal-revenue law to the selling price of cigars generally are accurate. Other figures herein given have been obtained from sources that are believed to be reliable, and it is believed these figures can be fully substantiated by facts.

Tariff is levied for two purposes:

(a) The production of revenue.

(b) The protection of home industries.

The clear Havana manufacturer of this country is fully protected by existing law against competition from foreign manufacturers. Therefore, the measure now under consideration must be dealt with solely upon its merits as a producer of revenue. It has been well said by Mr. Cooley in his work on taxation "that the power to tax is the power to destroy." Surely Congress has no desire to destroy the clear Havana cigar industry of this country. It must, therefore, realize that in order for any system of taxation upon this industry to be effective as a producer of revenue, it must be so arranged as to enable the manufacturer to operate his business at a reasonable profit. The industry is now in a most precarious condition. If the Government expects it to produce revenue, it must be fostered, not hampered by additional burdens that will make its expansion or even further conduct impossible.

Considering the question in this light, there would seem, in view of the facts presented, to be only one course for Congress to pursue, and that is to leave the duty on leaf and scrap tobacco as it was under the act of 1913 or reduce it.

STATEMENT OF E. PENDAS, TAMPA, FLA.

Senator SMOOT. Mr. Pendas, before you begin your statement I want to ask you a question for my information.

In the tariff act of 1909, and also in the tariff act of 1913, wrapper tobacco and filler tobacco when mixed or packed with more than 15 per cent of this wrapper tobacco, then the duty was imposed. The House bill now pending here provides that wrapper tobacco and filler tobacco when mixed or packed with more than 50 per cent of wrapper tobacco, then the duty is imposed. Is not that a protection for you?

Mr. PENDAS. We do not believe that is fair. We do not believe that is fair to the Government, and we do not believe the Government will receive full value in wrapper tobacco, on account of the packing of wrappers in Cuba, that a full bale of wrapper tobacco will ever come into the United States.

Senator SMOOT. Under the 50 per cent provision?

Mr. PENDAS. Yes, sir.

Senator SMOOT. Explain that. I can not see the reason why. Nobody has touched that question. I wish you would explain it, because I understand you are a tobacco man.

Mr. PENDAS. The island of Cuba does not produce wrappers quite as uniform as those that are used in this country or some other parts

of the world from which wrappers are imported. The people wh
pack the tobacco in Cuba have never in my experience packed a bal
of wrappers that contained 100 per cent.

Senator SMOOT. The provision in the House bill is 50 per cent.

Mr. PENDAS. The farmer as a rule packs the tobacco himself. Pra-
tically every farmer in Cuba has a pretense of growing wrappers
and he gets out so-called wrappers whether they are wrappers or n
Many of them are not wrappers. The packing is most deficient.

I have seen a very considerable portion of almost all of the im
ported Havana tobacco of the 1920 crop. A good deal of it con
tained over 25 or 30 per cent at least of wrappers that, if put i
cigars, would be unmarketable.

Senator SMOOT. The provision here allows you 50 per cent, an
you say 30 per cent.

Mr. PENDAS. Yes, sir. I say even the best bales would have tha
much thrown out.

Senator SMOOT. This allows you 50 per cent.

Mr. PENDAS. Yes, sir; this allows us 50 per cent, but my ideas o
the subject may not be in accord with manufacturers and importers
who are even far apart themselves on this, but everyone getting
bale of tobacco has in mind the use that he can put it to. Conse
quently, very few people agree on the same percentage in a bale. I
would be very difficult to arrive at that.

But, as I stated before, there is not a bale of Havana wrapp
that does not contain a great portion of tobacco unfit for use
wrappers to be sold on cigars.

Senator McCUMBER. What percentage would you say?

Mr. PENDAS. It varies very much.

Senator McCUMBER. But can you not give a general average?

Mr. PENDAS. As I said before, the best bales in Cuba that I hav
seen in the last few crops—and I have seen some of the best—co
tained not less than 25 to 30 per cent that was unfit for wrappers.

Senator McCUMBER. What would the average bale contain th
would be unfit for wrappers?

Mr. PENDAS. I could not figure that.

Senator McCUMBER. Would it be more than 50 per cent, in you
judgment?

Mr. PENDAS. Many of them; yes, sir.

Senator McCUMBER. Would it average more than 50?

Mr. PENDAS. The majority would.

Senator McCUMBER. Then you mean it would average more tha
50 per cent?

Mr. PENDAS. The majority would.

Senator McCUMBER. Very well.

Senator SMOOT. Thank you for your statement.

Senator McLEAN. Is not this tobacco assorted and the wrapp
duty assessed upon the wrapper portion and the filler duty upon th
filler portion?

Mr. PENDAS. It has been so far.

Senator McLEAN. It has been so far? What would be the resu
under the new law? Would it not be assorted under the operation o
the new law?

Mr. PENDAS. I expect so; but, as I stated before, I do not believe at a full bale of wrappers would be imported from Cuba—a 100 per nt bale.

Senator McLEAN. I understood you to say at the opening of your marks that you disapprove of the change because it would not be ir to the Government?

Mr. PENDAS. I don't think it would.

Senator McLEAN. Why?

Mr. PENDAS. Because my opinion is that a good many of these bales ould not be uniform throughout the United States, with the different climates and the different views.

Senator McLEAN. Let me ask you a plain question: Is it your idea hat wrapper tobacco would be brought in under the filler duty?

Mr. PENDAS. I don't know.

Senator McLEAN. Is not that what you mean?

Mr. PENDAS. I can not make that assertion.

Senator SMOOT. I do not agree with you that the 15 per cent in the xisting law is unfair to the Government.

Mr. PENDAS. To a certain extent it might be.

Senator SMOOT. I do not see that to raise that percentage would be nfair to the manufacturer of tobacco. That is why I wanted you to ell me why the 50 per cent is too high—if it is too high, and I think ou have stated it is too high. I rather think so, too, but not that he 15 per cent is too low.

Mr. PENDAS. In my individual opinion, 50 per cent is too high, ecause I believe it will leave the door open to return too many bales.

Senator SMOOT. I think we understand your position on that.

Senator FLETCHER. You think 15 per cent is too low?

Mr. PENDAS. I think that is rather low.

Senator FLETCHER. What would you make it?

Mr. PENDAS. My candid opinion, Senator, is that 35 per cent would e high enough.

Senator SMOOT. Thirty-five per cent?

Mr. PENDAS. That is my opinion.

Senator SMOOT. I wanted to get your opinion on it.

Mr. PENDAS. Gentlemen, our purpose as manufacturers in appearg before the Senate committee is to, if possible, demonstrate to you e situation with which we are confronted. We will confine our rearks to Schedule 6, paragraphs 601 and 602. We believe that is schedule, with these paragraphs, adopted as it now reads, would sult in serious loss to the Government of revenue and would do conderable harm to the industry as we know it.

We do not know and are not entirely familiar with all classes of gars manufactured in the United States, but we are thoroughly miliar with the conditions existing in our section of the country; at is, the State of Florida. We see the cigar industry to-day with e radical changes that have taken place in the last two years, and it a sick patient. It is a very sick patient.

We have at the present time no means of ascertaining what the conions are going to be, for no man can tell what the future has in re, much less in business with these changed conditions.

Up to 1917 the production in our section of the country was about per cent, between 80 and 85 per cent, of cigars that retailed at 10

cents or two for a quarter, leaving little more if any than 15 per cent of cigars to retail at a higher price than two for a quarter. With the changed conditions since 1917, the enormous cost of material, as I stated it before, with the additional cost of everything that goes to place a cigar on the market, with the raise in taxes from $3, that was the general revenue for all kinds of cigars manufactured, to cigars selling up to 10 cents, $9 a thousand, as you know; from 10 to 15 cents, $12 a thousand, and from 20 cents up at $15 a thousand. This change alone has brought this condition about so that the cigars that are manufactured, even in the clear Havana—and that is what I am referring to particularly—the cigar that sold at 10 cents has disappeared, and since 1918 the two for a quarter has been negligible. The public accepted but very few, a negligible quantity of them. They were not worth the money, from the consumers' standpoint, and we believe they were not worth the money, so little could we give for that amount.

Under the changed conditions and under the abnormal circumstances, the prosperity of the country, with the workingmen making the money they were making for a year and a half, at least, the manufacturers did not miss the 15-cent or the two-for-a-quarter production very much, because for the 15-cent size sufficient demand prevailed to make us forget for the time being those conditions.

But, unfortunately, on the 14th day of April, 1920, the 12,000 or 13,000 employees in the cigar factories struck. They were not well enough and wanted to be worse, and struck, demanding a recognition of the union. That strike lasted 10 months. In these 10 months the economic conditions of the world unfortunately reached the United States, and when the workers came back to our factories they thought, as we had not changed the prices, as we had promised to maintain the same wages as those with which they went out, they came back hoping the world was the same, at least.

It appeared to be so for a few weeks, but having been out of the market for 10 long months, the conditions in the meantime having changed, automatically our orders began to be canceled. Sixty days after the doors were opened we found we could not keep on employing the same number of men. A reduction took place in great numbers, and all throughout the summer and early fall, as Senator Fletcher has stated, we were not working in the clear Havana factories 50 per cent, not 40, of normal.

In the last part of July we had to offer the workingmen a reduction in wages, which they accepted, although it did not leave a very good feeling. They claimed it was as high as 40 per cent, and as we figured it out it was 17 per cent, approximately. That is as near as figures would make it, about 17 per cent.

That 17 per cent reduction, gentlemen, we found that we had to impose, conditions being as they were in the country, to reduce the price of our cigars. We were not making a 10-cent cigar clear Havana, and no manufacturer can produce it with the present conditions, because we have bought tobacco at the highest prices I have ever known for the 1920 crop. Having had a strike during 1920 practically since the 14th of April, we did not use that tobacco.

In 1920, when we started to work and business fell off so materially, the manufacturers had a whole lot of that tobacco on hand. It is not possible for any man that I know of—and I wish if there

s anyone he would controvert it—that can manufacture the clear Havana cigars to retail at 10 cents.

We found other conditions. We cut out 80 per cent of our normal business before 1917, when we cut out the 10-cent and two-for-a-quarter sizes that constituted the 80 per cent. Without these two priced cigars that were the popular cigars with the masses and with the middle classes, we found ourselves situated so that our factories would soon be for rent. We tried to arrive at some way of giving the public some size. The 10-cent size had to be absolutely discontinued. I don't know of anybody that could produce a long-filler clear Havana cigar to retail for 10 cents.

With no idea that we might sell the 10-cent cigar, if we wanted to show a semblance of staying in business, we had to do something with the two for a quarter. We studied that proposition as best we could, and we found that to produce a standard clear Havana cigar, made the same in the first-class cigar factories in the United States as it is made in Cuba—and we claim we make as good cigars in this country as they make in Cuba, and sometimes the American public found it out by their patronage of the reputable clear Havana factories in this country—we found on close examination that with the cost of material, with the cost of labor—because we didn't bring labor down to the prewar prices—labor was cut about one-half of the raise we had made. We didn't want to take the whole hog, because the cost of living had not come down to that level, and we were as reasonable as we possibly could be.

Senator McLEAN. What did you pay during war times by the week or by the thousand, so the committee can get some idea what your reduction in wages amounted to?

Mr. PENDAS. I stated about 17 per cent.

Senator McLEAN. That does not mean anything to us. Seventeen per cent of what? What did you pay in 1918 and 1919, when the wages were high, per thousand or per week, and what do you pay now?

Mr. PENDAS. I wish I could answer the question as the Senator desires, but we have piecework mostly in the factories.

Senator McLEAN. How much per thousand?

Mr. PENDAS. It varies anywhere from $21.35, the lowest, up to $300 per thousand for the cigar maker alone.

Senator McLEAN. Take a 10-cent cigar; what do you pay per thousand?

Mr. PENDAS. We do not manufacture that cigar, Senator.

Senator McLEAN. Take a cigar that you do manufacture; take a 15-cent cigar?

Mr. PENDAS. For a 15-cent cigar we paid before the war $17.

Senator McLEAN. Per thousand?

Mr. PENDAS. Yes, sir.

Senator McLEAN. And what do you pay now?

Mr. PENDAS. $21.

Senator McLEAN. What did you pay at the highest point?

Mr. PENDAS. $24. I don't want to make a mistake or make a statement that is misleading. For a 15-cent cigar we paid the cigar maker before the war, before the abnormal conditions set in, $17. During the high prices that was raised to $24, and when we made a cut on that

particular cigar it came down to $21. Consequently, we have still $ above normal on that cigar, and so on the others, because the reduc tion on the cigars was made uniform.

Senator McLean. About how much would that amount to per wee on the 15-cent cigar?

Mr. Pendas. To the cigar maker?

Senator McLean. Yes.

Mr. Pendas. A cigar maker makes an average of 1,000 cigars week.

Senator McLean. That would be $24 a week?

Mr. Pendas. No, sir; do you mean the reduction?

Senator McLean. Before the reduction.

Mr. Pendas. Before the reduction for that cigar maker; yes. I is now $21.

Senator Calder. Men or women?

Mr. Pendas. Both. We pay the same price to men or women.

Senator Calder. Are most of your laborers men or women?

Mr. Pendas. Men.

Senator McLean. Are they mostly Cubans?

Mr. Pendas. Yes; there are Italians, Spaniards, Cubans, an Americans.

Senator McLean. What percentage are Cubans?

Mr. Pendas. The larger percentage; probably 40 per cent.

Senator McLean. How will the wages you pay compare with th wages paid in Cuba?

Mr. Pendas. Our wages are always higher, Senator.

Senator McLean. How much higher?

Mr. Pendas. For example, I have seen sizes that we pay $26 fo in this country, and the same cigar in Cuba they only paid $17.

Senator McLean. And you pay as high as $300 to $400 p thousand for some cigars?

Mr. Pendas. For the sizes that are sold in this country for 10 cent or two for a quarter or 15 cents, we pay better wages in that propo tion than the Cubans do. We always did.

Senator McLean. But take the high-priced cigar that you pay $3 or $400 a thousand for.

Mr. Pendas. There are very few made of that kind. I just sug gested those because that was the limit.

Senator McLean. What would you pay for a 25-cent cigar?

Mr. Pendas. We paid usually before the war for a 25-cent ciga about $33 per thousand. We paid more than the Cubans did for tha size.

Senator McLean. How much would the filler of that cigar co you?

Mr. Pendas. Per thousand?

Senator McLean. Yes.

Mr. Pendas. I don't quite understand the question. Do you mea the cost of buying the filler?

Senator McLean. To you. How much would the filler cost pe thousand?

Senator Fletcher. How many pounds of filler make a thousan cigars?

Mr. Pendas. Of that size it takes about 23 pounds, Senator.

Senator FLETCHER. To make 1,000 cigars?
Mr. PENDAS. Of that size.
Senator McLEAN. How much per pound?
Mr. PENDAS. You mean the value in Cuba?
Senator McLEAN. That is what I mean.
Mr. PENDAS. We can not estimate the value in Cuba, because it has changed. Fillers, as a rule, in the island of Cuba could be bought previous to the 1918 crop, good average fillers that grew in the best section of Cuba that made Cuba famous——
Senator McLEAN (interposing). Never mind that. Take a 25-cent cigar. What would the filler cost you?
Mr. PENDAS. Not everybody uses the same type of filler.
Senator McLEAN. What does it cost you?
Mr. PENDAS. $1.50 or $1.60 before the war.
Senator McLEAN. Per pound?
Mr. PENDAS. Yes, sir.
Senator McLEAN. And it is 20 pounds to the thousand?
Mr. PENDAS. No, sir. It is more than 20. It is about 23.
Senator McLEAN. Twenty-three?
Mr. PENDAS. Yes, sir.
Senator McLEAN. What would the wrapper cost you?
Mr. PENDAS. The wrapper in normal times?
Senator McLEAN. Take it now.
Mr. PENDAS. Now?
Senator McLEAN. Yes.
Mr. PENDAS. I am ashamed to give it to you, but it would cost us $24 or $25.
Senator McLEAN. Per pound?
Mr. PENDAS. No; per thousand. I will give you the pounds per thousand if you wish.
Senator McLEAN. I would like to have you state that. It is the 25-cent cigar.
Mr. PENDAS. Yes. I will give it to you. It would take about 6 pounds.
Senator McLEAN. Do you use any of the Sumatra?
Mr. PENDAS. No, sir.
Senator McLEAN. That is all.
Mr. PENDAS. Now, then, gentlemen, I believe I was talking about the two-for-a-quarter cigar. I had reached that far, if I do not make a mistake.

We found if we did not produce a two-for-a-quarter cigar we might as well make up our minds to go out of business, because while our production had increased so materially during the time that so many ships were being made and so many other things, and everybody was making six or eight or ten dollars a day, people bought 15 and 20 and 25 cent cigars; but that was not a normal condition, and we doubted very much, and the last few months have demonstrated to us, that condition is not going to continue. So we had to decide to look for a two-for-a-quarter cigar.

A two-for-a-quarter cigar, in order to give some value, we decided on a certain cigar, that it was necessary, and we figured out the cost of that cigar. The cost of the two-for-a-quarter cigar in the clear Habana factories, to the best of the ability of the bookkeepers—I

don't know how to make figures very well these days—is $90.50 per thousand, for a thousand clear Havana cigars that will go on the market, and we figured that we would have to sell them at $85.

Senator McLEAN. What size would that be?

Mr. PENDAS. That would be a 4½-inch cigar, with a diameter of about 41 ring. The cigars are measured in order to get them uniform. We have a length, and we have rims made of rubber, and they go in the factory by length and rim. Those are about 4½ inches by 41 ring.

As I stated, we found to produce that cigar would cost the manufacturer $90.50, and they would have to be sold for $85 per thousand. The idea did not look very good, but we found the majority of the jobbers of the United States telling us they could not do business with the $85 cigar selling to the retailers, and the retailers could not live on the margin and they could not pay $85 for the cigar that would actually cost under present conditions to produce $90.50. The great majority of these jobbers are paying only $83.50 per thousand.

Senator McLEAN. What do they retail that cigar for?

Mr. PENDAS. Two for a quarter.

Senator CALDER. How long has that been going on?

Mr. PENDAS. It has been going on since the 1st day of September with almost all the manufacturers of clear Havana cigars, and those making cigars at Tampa. We have no rule established, and some men probably would lower weeks before, but it was sometime about September 1.

Senator McLEAN. The 20-cent cigar went to 30 cents, and the 25-cent cigar went to 35 cents, as sold by the retailers. Those are the imported cigars. I do not know about the cigars you make.

Mr. PENDAS. The imported cigars went very high. I am not very familiar with the retail prices, because I never sold cigars directly myself. I am giving you the facts from the importers' and manufacturers' standpoint. I know little about the retail business. I happen to know about this, because it has been so much discussed that I know something about it. When you are losing money it impresses itself very strongly on you.

Now, these are the conditions with which the cigar industry in the part of the country that I am familiar with, as I stated before, is confronted with. We believe that a tariff for revenue is necessary for the support of the Government and all of us must contribute, but we hope these abnormal conditions will not continue much longer. How long it will exist no man can tell, but everybody will agree that is too adventurous to do business at a loss, and nobody can tell what the future has in store for us. However, we are hoping for better days and are not willing to abandon our plants, but will lose some money for the time being.

That is the actual condition of the cigar industry, and particularly the clear Havana cigar industry. While Senator Fletcher was speaking I believe some Senator said something about a moderate raise of 10 cents a pound on fillers. It is very moderate, but we must understand this: Our impression is that we can not very well stand the increase in duty, and we believe that the Government, as I stated at the beginning, is not going to get more revenue. That is our belief, as could be demonstrated by figures, but I will not attempt to do so.

The only thing I want to do is to impress as strongly as I can on iose who have made the law and those who will continue to do so iat we believe it would be a mistake to raise the duty at this parcular time on a business that is in a very precarious condition.

Now, 10 cents a pound on filler tobacco, we would allow 25 pounds) the thousand, and as far as I know, and I have been making gars 40 years, no manufacturer ever has had enough material llowed him with 25 pounds, because I know that manufacturers ave at the end of the year to pay the difference between the tobacco sed on the basis of 25 pounds or explain the reason why he has less bacco than he ought to have at the end of the year. Consequently, 5 pounds for a thousand, as a rule, does not cover it.

In the normal production of a thousand cigars the average thouand cigars that is being made to-day, since the 10-cent cigar has sappeared, is 21 pounds and over per thousand, and that 21 pounds over per thousand, if it comes to that, is $2.10 on fillers on every ousand cigars increase.

Senator McLEAN. $2.10 on the fillers?

Mr. PENDAS. On the fillers alone per thousand, the proposed inease.

Senator FLETCHER. That is at 10 cents?

Mr. PENDAS. Ten cents a pound.

Now, then, as the revenue regulations are to-day, we have the gars classified. The cigar that sells for 5 cents must carry a $4 amp; the cigar that sells for not over 8 cents must carry a $6 amp—$6 per thousand; the cigar that sells from 8 to 15 cents must rry a stamp of $12 per thousand, and so on. Under those condions the manufacturer either loses more money or he must raise e price. If he is going to raise $2.10 on the fillers, and whatever e amount is on the wrappers, then that will throw the cigar into the xt classification and we must add the $3 difference in the stamp. nder those conditions we have found that we can not and will not able to continue under present conditions, and we will not be able raise prices. That is the situation in the cigar industry.

Another reason why I believe that these filler rates of duty ought be cared for is that it is not in competition with any kind of toreo used by anybody in the United States. On the contrary, it rors, it helps, it increases the value of the large interests repreited by growers and a number of producers in this country.

Only a few years ago, as the gentlemen here know, Connecticut ide-grown wrapper tobacco was very little known, but it was found blend well with Cuban fillers, and as a consequence the value of h was enhanced by using in combination. So for the reason that importation of Cuban fillers helps rather than hurts the domestic oduct the duty should not be increased.

Besides, some manufacturers, if they are going to produce cigars a loss, will find a substitute for tobacco imported from Cuba, and Government will lose additional revenue on that account as well.

Gentlemen, I do not wish to take up your time. I could give you ny statistics. I haven't got them here, but we can get them. I lieve the Senator will be kind enough to interest himself to prent the statistics.

Senator McCUMBER. Any statistics you desire to present will be de part of your testimony.

Mr. PENDAS. I believe that unless the committee desires to p[...] some questions I am through.

Senator McCUMBER. The committee is very much obliged to y[...]

Senator McLEAN. I understand you are addressing yours[...] mostly to the filler.

Mr. PENDAS. I am addressing myself generally, but principal[...] to the filler.

STATEMENT OF CHARLES FOX, NEW YORK CITY, REPRESENTI[...] NATIONAL CIGAR LEAF TOBACCO ASSOCIATION.

Mr. FOX. Mr. Chairman and Senators, in deference to the wis[...] of the committee, we who are of one mind as to the proposed [...] tariff had selected Mr. Cullman to present our side of the case. [...] would not have spoken had no objection been raised to the pr[...] posed increase of the so-called 15 per cent clause to 50, not believ[...] that there was any opposition to that proposed increase.

However, as Mr. Pendas seems to think the 50 per cent clause [...] too high, I feel it incumbent upon me to state to you why I bel[...] it is not too high. I might further say that Mr. Cullman's speech [...] statement includes nothing in reference to the 50 per cent clause. [...] the very reason that I stated, that we did not believe there wo[...] be any opposition to it.

I agree fully with all that Mr. Pendas said as to the growing [...] wrapper tobaccos in Cuba and methods of packing. I further [...] lieve that the average, as Senator McLean asked, of wrapper [...] baccos in so-called wrapper bales is not over 50 per cent.

I do not know whether you gentlemen understand the 15 per c[...] clause. Under the present tariff with the 15 per cent clause, i[...] bale of tobacco imported from Cuba is found to contain over 15 [...] cent of wrapper tobacco, the entire bale is assessed at the wrap[...] rate. Our contention is that that is very unfair to the importer [...] Havana tobacco.

We further contend that by increasing the percentage to 50 we [...] bring into this country certain grades of wrapper tobacco which [...] could not bring in now by reason of the fact, as I have just explain[...] of being assessed wrapper duty on filler tobacco. So with the 50 [...] cent clause inserted in the new bill the manufacturer imports s[...] grades of wrapper tobacco from Cuba as he can use in cigars t[...] are made in this country, he would then be assessed wrapper duty [...] the wrappers it contained and filler duty on the balance.

I believe, gentlemen, it would not be an unfair request for us [...] make. It is a feature of the new tariff bill with which the Treas[...] Department is in harmony with us. As I understand it, it [...] recommended by the Treasury Department to the Ways and Me[...] Committee.

I can not agree with Mr. Pendas in his statement that 50 per c[...] would be too high and that 35 per cent would be fair.

That is all I wish to say on this subject, but I will further [...] permission of the committee to file, after Mr. Cullman has made [...] remarks, certain resolutions and briefs from various tobacco org[...] zations and cigar-manufacturing organizations from other section[...] the country.

Senator McCUMBER. That may be done.

'ATEMENT OF JOSEPH F. CULLMAN, SR., REPRESENTING THE NATIONAL CIGAR LEAF TOBACCO ASSOCIATION.

Mr. CULLMAN. Mr. Chairman and gentlemen, in order to econo-ize time, may I request that I be permitted to present my argument, the conclusion of which I would be delighted to answer any ques-ns that may be asked?

Senator MCCUMBER. I hope that request will be adhered to.

Mr. CULLMAN. On behalf of the National Cigar Leaf Tobacco sociation, which is composed of the great majority of importers Havana, Sumatra, and Java tobaccos, packers and dealers in leaf bacco, many of whom are interested in the growing of tobacco, as ll as the cigar-manufacturing branch of the industry generally, I sire to urge upon your honorable committee the vital importance amending the tobacco schedule of House bill 7456 in several par-ulars in order to avoid serious injury to the cigar industry of the ited States and to the growers and distributors of cigar leaf.

I have been requested to present the arguments by reason of having en engaged in the industry for over 50 years as a dealer and cker of cigar leaf in the States of Pennsylvania, Ohio, Wisconsin, w York, Connecticut, and Massachusetts, and as a grower in Con-cticut, as well as an importer of Sumatra, Java, and Havana baccos.

The amendments which will be suggested are absolutely necessary avoid further acceleration of the present downward tendency of gar production, which is rapidly reducing the Federal revenues m the internal tax on cigars and customs duties on imported gar leaf.

Only the most cursory examination of the statistics of production the cigar industry during the past 20 years is necessary to con-ce any intelligent person that the present situation is most critical d that only the wisest and most farsighted policy in the way of tax ljustment can rescue it from impending ruin. The table follow-g, showing the output of cigars and cigarettes since 1900, is incon-vertible evidence that the cigar manufacturers can carry no fur-er burdens but, indeed, must have substantial relief if the industry not to become moribund. These figures show that while the out-t of cigarettes in 1901 was but little more than one-third that of gars, it has now risen to nearly six times the cigar industry, which s practically stood still for 20 years, despite the enormous increase population.

Year.	Cigars.	Cigarettes.	Year.	Cigars.	Cigarettes.
[illegible]	6, [illegible] 12	2, [illegible] 97	1911	8,282,337,873	10
[illegible]	6, [illegible] 53	2, [illegible] 47	1912	8,099,448,730	13
[illegible]	7, [illegible] 50	3, [illegible] 15	1913	8,530,916,995	15
[illegible]	7, [illegible] 42	3, [illegible] 22	1914	8,248,891,047	16
[illegible]	7, [illegible] 93	3, [illegible] 11	1915	7,605,328,265	17
[illegible]	8, [illegible] 53	4, [illegible] 37	1916	7,932,610,191	25
[illegible]	8, [illegible] 97	5, [illegible] 38	1917	8,527,119,269	35
[illegible]	7, [illegible] 39	5, [illegible] 96	1918	7,901,015,823	46
[illegible]	7, [illegible] 74	6, [illegible] 35	1919	7,785,592,491	53
[illegible]	7, [illegible] 51	8, [illegible] 84	1920	8,549,960,895	47

The table below shows the production for the first nine months the calendar year 1921, as compared with the corresponding months

of 1920. It will be noted that the production of cigars for the firs nine months of 1921 has been at the rate of but 6,839,623,000 for th calendar year—a much smaller total than in any year since 1900:

	Cigars.	Cigarettes.
January-September, 1921	5,120,719,750	43,771,6[illegible]
January-September, 1920	6,132,717,200	39,392,[illegible]

The new tariff imposes heavy additional burdens upon the cig industry, which is already staggering under adverse conditions, th have prevented any increase in production during the past 20 yea and that are now restricting the output at a rate which promis smaller production for 1921 than in any other year since 190 Wrapper tobacco is raised by the new bill from $1.85 to $2.10 p pound, an increase of 25 cents; filler tobacco from 35 cents to 45 cen per pound. It goes without saying that these duties will be add to the cost of imported Sumatra wrappers and to Cuban fillers a scrap and will materially increase the cost of producing cigа Domestic growers of cigar leaf tobacco, however, will receive litt or no benefit, but in the main will be adversely affected, for t reason that both Sumatra wrappers and Havana fillers are used combination with cigar leaf of domestic production and are nec sary to sustain the demand for domestic leaf. If their price is rai because of the increased duty, the cigar manufacturers will have alternative but to reduce the price he can pay for domestic wrappe binders, and fillers, unless he can cut the wages of his workmen, wh is inadvisable.

To increase the price of any grade of cigars under existing c ditions is an absolute impossibility; on the contrary, the dema for lower prices for merchandise of every kind is being accentua in the case of cigars, and in the effort to maintain quantity prod tion on a scale that will continue to afford employment for work in the industry many factories are now operating on a dangerou narrow margin, where, indeed, they are making any money at all

It has been demonstrated beyond question that war prices cigars can no longer be maintained, and the general price tende throughout the industry is materially downward.

Nearly one-half of the cigars manufactured in the United Sta are wrapped with Sumatra leaf tobacco, which, although high price and burdened with a heavy duty, is so peculiarly suited to wrapping of cigars and can be so favorably worked in the factory to make it practicable to employ it in the production of mediu well as high priced goods. An increase of 25 cents per pound in duty on wrapper leaf tobacco will raise the cost of the 2 pounds Sumatra wrappers required to cover 1,000 cigars by 50 cents, amount which can not be absorbed by manufacturer, jobber, or tailer under existing conditions.

But this is not all. Under the present system of internal-reve taxation, adopted since the last tariff revision, cigars pay a tax sliding scale according to retail price. Thus, for example, the which retails at 8 cents pays an internal-revenue tax of $6 per t sand. If, however, the retail price of this cigar is raised by

nallest fraction of a cent, the cigar immediately becomes subject to ıx at the higher rate of $9 per thousand, an increase of $3.

Thus an increase of 25 cents per pound.in the duty on Sumatra af would raise the tax-paid production cost of the popular-priced gar $3.50 per thousand, making it imperative that the consumer ıall pay more for this cigar. It will be noted that these taxes relate ılely to cigars containing no imported filler tobacco. The effect of ıe proposed changes upon cigars manufactured with imported fillers s well as wrappers would be much more pronounced, and will be ointed out later in our discussion of the proposed rates on filler and rap tobacco.

As it is perfectly apparent that the price of the popular cigar can ıt be raised under existing conditions, the cigar manufacturer, if ıe cost of his Sumatra wrappers is increased, would be obliged to ıoose between two alternatives—equally disastrous to the country large—of reducing the wages of his employees or cutting the price pays to the farmers who grow his binders and fillers. It is impossible to escape this conclusion, which is based upon facts demonrated throughout the entire cigar industry.

The proposed increase in the duty on wrapper tobacco has been rged on behalf of the producers of so-called shade-grown tobacco of ew England, Georgia, and Florida. While we do not pose as philnthropists, we are vitally interested in the welfare of the American ırmers who grow cigar leaf tobacco other than shade-grown in the tates of New England, New York, Pennsylvania, Ohio, and Wisınsin approximating 200,000,000 pounds, as well as those in New ngland, Georgia, and Florida growing shade approximating 10,-),000 pounds. Any increase in the duty on wrapper tobacco above ıe former rate of $1,85 per pound would have disastrous conseuences not only for the cigar-making industry of the country but r all cigar-leaf growers.

While we are anxious to avoid any invidious comparisons, it is an ndeniable fact that the producers of shade-grown tobacco in New ngland are to-day the most prosperous raisers of cigar leaf tobacco ı the United States and do not need any more protection than they ave enjoyed during the past two decades. Consumption of New ngland shade wrappers has steadily increased in recent years, and ıere is undeniably an excellent market in this country for all of this obacco that can be raised. Any increase in the duty, therefore, is nnecessary and would only work a serious injury to the cigar trade nd to the farmers who grow filler and binder tobacco. Ultimately ıe New England growers themselves, of which there are about ,000 independent growers of tobacco as compared to about 25 corporations or firms raising shade, would be injured because of the duced prices obtained for their fillers and binders.

The domestic growers of shade wrapper leaf tobacco have steadily ıcreased their output during the past 10 years in the face of the fact ıat the cigar industry as a whole has remained at a standstill, a fact hich shows beyond a question that they do not need more protecon. Will Congress destroy a large part of the cigar industry in ıe hope of still further increasing the profits of a comparatively mall number of growers engaged in the production of shade wrapper af tobacco, of which there are only about 25 in New England and in lorida?

of 1920. It will be noted that the production of cigars for the firs nine months of 1921 has been at the rate of but 6,839,623,000 for th calendar year—a much smaller total than in any year since 1900:

	Cigars.	Cigarettes.
January–September, 1921	5,120,719,750	43,771,6[illegible]
January–September, 1920	6,132,717,200	39,392,9[illegible]

The new tariff imposes heavy additional burdens upon the cig industry, which is already staggering under adverse conditions, th have prevented any increase in production during the past 20 yea and that are now restricting the output at a rate which promis smaller production for 1921 than in any other year since 19 Wrapper tobacco is raised by the new bill from $1.85 to $2.10 p pound, an increase of 25 cents; filler tobacco from 35 cents to 45 cen per pound. It goes without saying that these duties will be adde to the cost of imported Sumatra wrappers and to Cuban fillers a scrap and will materially increase the cost of producing ciga Domestic growers of cigar leaf tobacco, however, will receive litt or no benefit, but in the main will be adversely affected, for t reason that both Sumatra wrappers and Havana fillers are used combination with cigar leaf of domestic production and are nec sary to sustain the demand for domestic leaf. If their price is rai because of the increased duty, the cigar manufacturers will have alternative but to reduce the price he can pay for domestic wrappe binders, and fillers, unless he can cut the wages of his workmen, whi is inadvisable.

To increase the price of any grade of cigars under existing co ditions is an absolute impossibility; on the contrary, the dema for lower prices for merchandise of every kind is being accentua in the case of cigars, and in the effort to maintain quantity produ tion on a scale that will continue to afford employment for work in the industry many factories are now operating on a dangerous narrow margin, where, indeed, they are making any money at all.

It has been demonstrated beyond question that war prices cigars can no longer be maintained, and the general price tende throughout the industry is materially downward.

Nearly one-half of the cigars manufactured in the United Sta are wrapped with Sumatra leaf tobacco, which, although high price and burdened with a heavy duty, is so peculiarly suited to t wrapping of cigars and can be so favorably worked in the factory to make it practicable to employ it in the production of medium well as high priced goods. An increase of 25 cents per pound in duty on wrapper leaf tobacco will raise the cost of the 2 pounds Sumatra wrappers required to cover 1,000 cigars by 50 cents. amount which can not be absorbed by manufacturer, jobber, or tailer under existing conditions.

But this is not all. Under the present system of internal-reve taxation, adopted since the last tariff revision, cigars pay a tax o sliding scale according to retail price. Thus, for example, the ci which retails at 8 cents pays an internal-revenue tax of $6 per th sand. If, however, the retail price of this cigar is raised by

smallest fraction of a cent, the cigar immediately becomes subject to tax at the higher rate of $9 per thousand, an increase of $3.

Thus an increase of 25 cents per pound in the duty on Sumatra leaf would raise the tax-paid production cost of the popular-priced cigar $3.50 per thousand, making it imperative that the consumer shall pay more for this cigar. It will be noted that these taxes relate solely to cigars containing no imported filler tobacco. The effect of the proposed changes upon cigars manufactured with imported fillers as well as wrappers would be much more pronounced, and will be pointed out later in our discussion of the proposed rates on filler and scrap tobacco.

As it is perfectly apparent that the price of the popular cigar can not be raised under existing conditions, the cigar manufacturer, if the cost of his Sumatra wrappers is increased, would be obliged to choose between two alternatives—equally disastrous to the country at large—of reducing the wages of his employees or cutting the price he pays to the farmers who grow his binders and fillers. It is impossible to escape this conclusion, which is based upon facts demonstrated throughout the entire cigar industry.

The proposed increase in the duty on wrapper tobacco has been urged on behalf of the producers of so-called shade-grown tobacco of New England, Georgia, and Florida. While we do not pose as philanthropists, we are vitally interested in the welfare of the American farmers who grow cigar leaf tobacco other than shade-grown in the States of New England, New York, Pennsylvania, Ohio, and Wisconsin approximating 200,000,000 pounds, as well as those in New England, Georgia, and Florida growing shade approximating 10,000,000 pounds. Any increase in the duty on wrapper tobacco above the former rate of $1,85 per pound would have disastrous consequences not only for the cigar-making industry of the country but for all cigar-leaf growers.

While we are anxious to avoid any invidious comparisons, it is an undeniable fact that the producers of shade-grown tobacco in New England are to-day the most prosperous raisers of cigar leaf tobacco in the United States and do not need any more protection than they have enjoyed during the past two decades. Consumption of New England shade wrappers has steadily increased in recent years, and there is undeniably an excellent market in this country for all of this tobacco that can be raised. Any increase in the duty, therefore, is unnecessary and would only work a serious injury to the cigar trade and to the farmers who grow filler and binder tobacco. Ultimately the New England growers themselves, of which there are about 5,000 independent growers of tobacco as compared to about 25 corporations or firms raising shade, would be injured because of the reduced prices obtained for their fillers and binders.

The domestic growers of shade wrapper leaf tobacco have steadily increased their output during the past 10 years in the face of the fact that the cigar industry as a whole has remained at a standstill, a fact which shows beyond a question that they do not need more protection. Will Congress destroy a large part of the cigar industry in the hope of still further increasing the profits of a comparatively small number of growers engaged in the production of shade wrapper leaf tobacco, of which there are only about 25 in New England and in Florida?

Studied effort has been made to give Congress the impression that a large number of farmers in New England are in sore need of an increased duty on wrappers. As a matter of fact, the individual grower of leaf tobacco under shade in New England is almost a myth. Approximately 35 per cent of the shade-grown tobacco of the States is raised by a single corporation, which is also reputed to produce more than 50 per cent of the tobacco grown under shade in southern Georgia and northern Florida, the only other shade-grown district in the country.

Between 80 and 85 per cent of the production of shade-grown tobacco in New England is raised by six or eight large concerns, and the business is in no way suited to the operations of the small farmer. From $750 to $1,000 capital per acre is required to grow this tobacco, and the tendency, therefore, is to confine its production to rich corporations and firms.

The tendency of the shade-grown industry as conducted in New England is toward corporation domination and absentee landlordism and against individual enterprise and diversification of crops on the part of the farmer. That can be proven by a statement made by Mr. Sheppard, representing the New England tobacco growers, before the Ways and Means Committee last January.[1]

The shade-grown industry in New England is less than 20 years old. In the first decade following 1900 its growth under individual initiative was slow, but since 1910, under corporate direction, the acreage has increased from 1,000 to 7,000 acres. During the same decade the market price of this tobacco has risen from $1.75 to as high as $5.25 per pound for the best grades.

Mr. FLOYD. Are you sure your figures are correct?

Mr. CULLMAN. I say during that period as high as $5.25, which was, if I mistake not, the very best grade.

Mr. FLOYD. To be sold at $1.25?

Mr. CULLMAN. $1.75. I may be mistaken. I think you sold some at $1.75. We desire especially to emphasize in this connection the testimony we have on so many occasions given before committees of Congress. The various types of tobacco stand or fall on their own merits. Sumatra tobacco is used for wrappers because of its suitability in both quality and appearance. New England shade wrappers have gained the position of high-priced wrappers used by our cigar manufacturers because they have demonstrated their peculiar fitness for certain types of cigars and because the consumer demands them. Florida wrapper tobacco remains to-day what it has always been—only a poor substitute for Sumatra. It has its place, and even its special value to the industry in the manufacture of a low-priced cigar, but we believe that there is no justification for upsetting established costs and desirable conditions in a great industry in order to stimulate the production of an article which it is claimed needs a protective duty of more than $1.85 per pound.

An inkling of what may be expected to happen in the event any increase is made in the duty on Sumatra tobacco may be gathered from the fact that as a result of the increase in the price level of the latest inscriptions or auctions of this tobacco recently held in Holland there has been a reduction in the purchases of this tobacco for

[1] See pages 1384–1385, hearings before Ways and Means Committee, Jan. 20, 1921

hipment to the United States from a normal quantity in excess of 3,000 bales to approximately 18,000 bales. This shrinkage in the mount of Sumatra tobacco to be imported during the coming year, pproximating 2,500,000 pounds, caused by the increased prices, educing consumption of cigars, will represent a loss to the United States Treasury in duties of nearly $6,000,000. It is obvious that ny increase in the duty on wrapper leaf tobacco would have the ame effect as an increase in the foreign price, which promises to educe current revenues so disastrously.

We are finally convinced that if Congress will consider, on the ne hand, the present condition of the decreasing cigar industry and hat of the tobacco growers of New England, New York, Pennsylvania, Ohio, and Wisconsin, who are facing actual disaster in 921, and, on the other hand, the corporations engaged in the production of shade-grown wrappers in New England, Georgia, and Florida, it will deny the appeal for any duty on wrapper tobacco bove $1.85 per pound, not only because it is unnecessary, but because t will reduce rather than increase revenue jointly derived from ustoms duties and internal-revenue taxes on cigars.

The proposed increase from 35 to 45 cents per pound in the luty on filler tobacco promises to be even more serious to the cigar ndustry than the increase on wrappers. Havana fillers, which contitute the great bulk of the importation of this class of cigar leaf, re used not only in the manufacture of clear Havana cigars, but onstitute the most desirable filler employed in cigars wrapped with Sumatra and with practically all domestic wrappers, including the ighest grades of New England shade-grown. In the case of those igars in which Havana fillers exclusively are used, an increase of 0 cents per pound in the duty will raise the cost of production approximately $2 per thousand, as 20 pounds of fillers per thousand igars is consumed. Of course, such an addition to the cost of production could not be absorbed by the manufacturer, nor could it ossibly be passed on to the consumer, as it would involve a higher nternal revenue tax, making a net increase of no less than $5 per housand, which, in the case of the Sumatra-wrapped cigar or that overed with New England shade-grown, would be increased 50 ents additional because of the higher duty on the wrappers. Any ttempt to secure such an advance in the retail price would meet with isastrous failure and would heavily curtail consumption and production and therefore both internal revenue and customs collection. Thus the proposed increase in the fiiller rate would force the manufacturer to resort to the same expedient that would be made necessary by a higher wrapper duty, namely, to cut the wages of his mployees or reduce the prices paid to the growers of domestic fillers, binders, and wrappers.

Any increase in the duty on filler tobacco would have an immediate and most injurious effect upon the domestic grower of shade-grown wrappers. The demand for a high-grade cigar has been met in recent years by the use of the Havana filler exclusively or a large percentage of Havana blended with the best domestic fillers and wrappers with Connecticut shade-grown leaf. Should manufacturers of these cigars be forced to the expedient of reducing the amount of Havana fillers in these goods, the reputation of the Con-

necticut-wrapped cigar would speedily be destroyed and its consumption materially reduced. This is a consideration of overshadowing importance because of the prominent position which this cigar has come to occupy during the last 10 years, owing to the liberal use of Havana tobacco in its manufacture.

So far as we are advised, there has been no suggestion that the proposed increase in the duty on filler tobacco would be of advantage to any class of domestic cigar-leaf growers. It is a well-known fact that there is absolutely no competition between imported and domestic fillers because of the great difference in the two types of tobacco. On the contrary, the importation of Havana fillers has stimulated the production of domestic leaf not only for wrapper purposes but to make satisfactory blends with imported fillers.

We trust that Congress has not gathered the impression that the duty on imported fillers is a matter of less consequence to the domestic cigar trade than the rate on wrappers, because of the fact that no representations have heretofore been made concerning this item. The trade was led to believe by the action taken on the emergency tariff bill that no increase on filler tobacco was contemplated, a belief which we submit was justified in view of the serious menace to our industry obviously involved in any proposition to increase the cost of Havana fillers.

The proposed increase in the duty on scrap tobacco from 35 cents to 55 cents per pound would also deal a serious blow to the cigar industry and particularly to those manufacturers who employ Havana fillers in the production of their goods. The great bulk of imported scrap tobacco is of Cuban origin and is used in combination with domestic filler leaf in the production of a cigar of excellent quality at a price within the reach of the masses. This cigar could not possibly be made under a higher rate of duty on scrap tobacco.

We would further call your attention to the fact that it is unfair and illogical to raise the duty on scrap tobacco for the reason that the rate of 50 cents per pound, fixed by the present law on stemmed filler, provides a differential of 15 cents per pound, which was specifically designed to take care of the stems and scraps. To illustrate: 100 pounds of unstemmed tobacco, at a duty of 35 cents per pound would pay the Government $35 or exactly the same amount of revenue that would be derived from the importation of 70 pounds of stemmed tobacco—the net result of stemming 100 pounds of leaf—at the rate of 50 cents per pound. It will thus be seen that there is no justification for the present rate of duty on scrap tobacco of 35 cents per pound, and that in fairness to all concerned it should be lowered rather than increased. As a matter of fact, if the total revenue derived were the only consideration, it would be to the advantage of the Government to admit scrap tobacco free of duty. Of course, we do not urge this but merely state it as an economic fact.

A consideration of overshadowing importance as to this proposed increase in the duty of scrap tobacco is the incontrovertible fact that the addition of 20 cents per pound would prove prohibitory. The Ways and Means Committee appears to have overlooked the fact that prior to the passage of the Underwood-Simmons Act of 1913 the duty on scrap tobacco was 55 cents and operated to exclude this form of cigar leaf. The act of 1913, however, reduced the scrap rate to 35 cents, with the result that substantial quantities of scrap to-

bacco have been imported and blended with domestic fillers in the production of a very acceptable low-priced cigar, covered with domestic binders and wrappers. Should the 55-cent rate be restored at this time, there can be no doubt whatever that it would operate merely to cut off the customs revenue now derived from scrap tobacco, reduce the quality of the moderate-priced cigar of good flavor, and substantially decrease consumption and production, thus causing a heavy shortage in the internal revenue from this class of goods.

We are fully alive to the necessities of the Government in the way of revenue, but we are confident the present customs duties on cigar-leaf tobacco and the internal revenue taxes on cigars are substantially above the revenue point. No wise business man would follow the policy of unnecessarily adding to the cost of a product, the sale of which he desires to increase, and it is submitted that the Government has much more to gain from a farsighted policy of taxation that will stimulate the cigar industry, increase consumption, and thus increase the internal revenue, while at the same time benefiting the industry and all those dependent upon it, than by adding burdens that only mean serious depression, if not absolute ruin.

The figures we have quoted showing the expansion of the cigarette industry graphically illustrate this point. The internal-revenue tax on cigarettes made during the fiscal year 1900 netted but $3,969,191, or about one-fifth the amount paid on cigars. During the fiscal year 1920 the cigarette tax produced no less than $151,494,415, or nearly three times the amount derived from the tax on cigars. It is obvious that if a sounder policy had been adopted in the taxing of cigars and cigar-leaf tobacco during the past 20 years, an increased production would have resulted in much larger aggregate revenue, even though the rate of taxation were more moderate.

It is only necessary to compare the figures for cigar production for the first nine months of the current calendar year with those for the corresponding period of 1920 to show where the real interest of the Government lies with respect to revenue derivable from this industry. The loss to the Government in the internal-revenue tax on cigars, owing to the depression in the industry, promises to exceed $14,000,000 for the current year, an amount substantially greater than the entire customs duties on the prospective importation on cigar leaf for the coming 12 months, which probably will not exceed $5,875,000 on wrappers and $6,480,000 on fillers, or a total of $12,355,000. These figures do not take into account the almost certain shrinkage due to the increased duties imposed by the so-called farmers' emergency tariff law now in force. The addition of further burdens will unquestionably accentuate the depression now prevailing and will cause further loss of revenue. If, on the other hand, the trade is assured of favorable conditions and reasonable taxation, both customs and internal revenue, it will undoubtedly rally strongly and Congress can confidently look forward to a recovery of the lost ground and to a very substantial increase in output and revenue during the coming year.

We would, therefore, earnestly urge the amendment of the pending bill by the restoration of the rates of the existing law on both filler and scrap tobacco, and by the adoption of a rate not exceeding $1.85 per pound on wrapper tobacco. Any rates higher than those we suggest will unquestionably prove to be above the scientific

revenue point, and will afford no needed protection to any class of leaf-tobacco growers. They will serve only to further burden an industry now carrying much more than its full share of the tax load.

Mr. Fox. Mr. Chairman, I now ask permission to file for the record the resolutions and documents I referred to.

Senator McCumber. That may be done.

(The documents referred to are as follows:)

CINCINNATI, OHIO, *December 5, 1921*

CHARLES FOX,
Care W. Z. Crouse, Washington, D. C.:

The Cincinnati Leaf Tobacco Board of Trade unanimously objects to any increase in tariff duty above the old rate on cigar leaf tobacco, as it would cause disaster to the cigar industry. It would also seriously injure the cigar leaf tobacco farmer owing to a close alliance between the two. If the cigar business is good, it creates a greater demand for tobacco; hence a better price, and vice versa.

GEORGE M. BERGER, *President.*

CINCINNATI, OHIO, *December 5, 1921.*

CHARLES FOX,
Care W. Z. Crouse, Washington, D. C.:

The Cincinnati Cigar Manufacturers' Association unanimously objects to any additional tariff duties above the old rates on cigar-leaf tobacco, as the industry is taxed at its utmost, and any additional will curtail our business as well as the Government income from same.

FRED W. TREFZGER, *President.*

NEW HAVEN CONN., *December 5, 1921.*

The FINANCE COMMITTEE, UNITED STATES SENATE:

Permit me in as few words as possible to present to you the cigar manufacturers' position in regards to the proposed increase in duty on wrapper and filler tobacco.

I wish to consider especially class B and class C cigars in view of the fact that these two classes constitute the greater proportion of the entire cigar output in the United States.

Previous to the war class B and class C cigars were popularly known as the 5 and 10 cent cigars and as such enjoyed at least their normal prosperity. During the war period, because of the increases in raw material, labor, and especially because of the enormous increase of internal revenue, the cost of production forced these former 5 and 10 cent cigars into revised classes, with limitations set at 8 and 15 cents, respectively.

During the first period of readjustment to these conditions it was found that class B, or former 5-cent cigars, increased in demand to the detriment of class C cigars, but after a few months the manufacturer found that in order to maintain the standard quality of his former 5-cent cigar he was compelled to change them into class C. This for a short time gave class C a strong position as to output. The increased sales of class C proved only temporary, however, as the change in classification demoralized standard values. As a result the production of both class B and C have been diminishing, especially during the past nine months.

Here in New England the old popular seed and Havana 10-cent cigar, now in class C selling at 13 to 15 cents, is filled with all-Cuban filler wrapped with either Connecticut or Sumatra, and the former 5-cent cigar, now 8 cents, is filled with domestic filler and wrapped with Sumatra or domestic leaf. It is a fact that the larger proportion of class C cigars here are filled entirely with Cuban tobacco, and it requires from 18 to 20 pounds of filler, subject to shapes and sizes, to produce 1,000 cigars, so that the proposed increase of 10 cents per pound would mean an increased cost of $1.80 to $2 per thousand. These cigars are sold to the retail dealer at from $95 to $108 per thousand and in

turn sold to the consumer at 13 cents or two for 25 cents. This does seem primarily too small a profit for the retail dealer who, in the face of contemplated increases, is demanding standard goods at less cost.

This condition has caused many manufacturers throughout the cigar industry to blend or mix class C cigars using part Cuban and part domestic filler. But even with all the attempted experiments the output of classes C and B have been and are to-day rapidly diminishing. The cigar industry is laboring under the tremendous cost of production while the consumer has, through economy or other reasons, either chosen the pipe or cigarette. It is evident that the consumption of cigars has not kept pace with the increase of population in the past 20 years.

The unemployment of cigarmakers is another very serious proposition which must be considered. Some local unions realizing the ever lessening demand for workers have voluntarily accepted wage decreases of from two to three dollars per thousand in order to stimulate sales. This fact proves the seriousness of the situation. It is the first time in the history of the Cigarmakers International Union where locals have been permitted to voluntarily reduce their wages. In the event that this proposed increase on Havana filler is accepted the employees' sacrifice has been to no avail.

In summing up conditions as they actually are it seems most unreasonable to revise taxation in a way that will further burden an industry already overburdened. The cigar industry to-day is fighting a noble battle to hold its own in the face of many obstacles. For months past records show that it is a losing fight. Surely there can not be an advantage to either the United States Treasury, the manufacturer or the employees of the industry to cause a further falling off of consumption which will be the inevitable result of the proposed taxation.

Respectfully submitted.

F. D. Grave.

Lancaster, Pa., *December 7, 1921.*

Hon. Boies Penrose,

Chairman, and Members of the Senate Finance Committee.

Gentlemen: In reference to the rate of duty on Sumatra and Havana tobacco, as it shall be written in the permanent tariff bill: Coming, as I do, from Lancaster County, Pa., where for generations our farmers have been producing tobacco and have gone to great expense to equip their farms with suitable curing barns and dampening cellars and have their land in the highest state of cultivation. Tobacco produced on our farms is used as a filler in a moderate-priced cigar. For this reason our farmers have never received the fancy prices that many other sections of our country have; but they are a hard-working, frugal class of people, and as a rule have prospered. Ninety per cent of our tobacco, or thereabout, goes into cigars that are wrapped with Sumatra tobacco. Should the permanent tariff be written for more than $2 per pound, and this is even going to work a hardship, but represents the very highest duty that the trade will be able to absorb, it is going to be a mighty burden and a heavy loss to our Lancaster County farmers. The manufacturer must and will have Sumatra. He can not raise the price of his cigars at this time, for he is in a very tight fix at present, with the public demanding cigars at a lower price. What must be the result? Either he must demand a reduction in the price of his filler and binder, reduce the quality of his cigar—and that will kill the brand—or cut down his production, which will happen if he raises his price, for consumption will fall off. This will mean that our manufacturers will use less Sumatra, and our Government will lose the revenue. In the same way would we be affected by a higher duty on Havana tobacco from the island of Cuba. Pennsylvania tobacco, on account of its mildness, is an ideal combination with Havana. Raising the duty would force the manufacturer to get a reduction some place to keep his cigars at a certain price and standard, and our Pennsylvania farmer again would be the loser.

Now, gentlemen, the tobacco and cigar industries are in a very precarious condition, and are in no position to assume additional burdens, and I pray you to give the above facts careful consideration.

Respectfully submitted.

Lancaster Leaf Tobacco Board of Trade,
William H. Rauch, *President.*

RESOLUTIONS OF THE PHILADELPHIA LEAF TOBACCO BOARD OF TRADE, OCTOBER 27, 1921.

Whereas the new tariff bill (H. R. 7456) recently passed by the House of Representatives makes material increases in the rates of import duties on cigar leaf tobacco; and

Whereas the cigar and leaf tobacco industries are now overburdened by import duties and internal revenue taxes to the extent that they have been practically at a standstill for the past 20 years: Therefore be it

Resolved, That the Philadelphia Leaf Tobacco Board of Trade urges the Finance Committee of the United States Senate to amend the tariff bill (H. R. 7456) by the substitution of the rates in force previous to the passage of the emergency tariff bill.

PHILADELPHIA LEAF TOBACCO BOARD OF TRADE,
Philadelphia, Pa., October 27, 1921.

Hon. BOIES PENROSE,
United States Senate, Washington, D. C.

DEAR SIR: We, the members of the Philadelphia Leaf Tobacco Board of Trade, respectfully, but most emphatically, wish to protest against any increase in the import duties on cigar leaf tobacco and beg to call your attention to the following facts in support of our contention.

We understand that the purpose of the proposed tariff revision is to stimulate American industry, and ours is an industry which is certainly in most serious need of a stimulus. The leaf tobacco and cigar industries of this country are now overburdened with import duties and internal revenue taxes and as a consequence have been practically at a standstill for the last 20 years, as can be readily verified by the reports of the Internal Revenue Department. What little expansion there has been has not even kept pace with the increase in the population of the country.

Any increase in the duty on cigar leaf tobacco would completely demoralize the entire industry, as the wages of cigar makers, the prices paid for domestic fillers and binders and the retail prices of cigars are all predicated on the present import duties. It follows, therefore, that the industry can hardly hold its own, much less expand, if there should be a substantial increase in the cost of its raw material.

An increase in the duty on cigar leaf tobacco could not be absorbed by the cigar manufacturer, but would result in an increase in the retail prices of cigars. In the case of many brands now selling on a small profit basis it would force them into a higher retail-price classification, thus raising the internal revenue tax thereon and necessitating a further advance in the price to cover this tax. Naturally these increases would restrict production, cut cigar makers' wages, and reduce the prices paid for cigar leaf tobacco to the farmers of Pennsylvania, Ohio, Wisconsin, New York, and Connecticut.

The former rates of duties on cigar leaf tobacco afford ample protection to the domestic grower. As far as the duties on fillers is concerned, the domestic grower receives no injury at present, because there is really no competition between his product and the imported one. Practically all the imported filler tobacco used in the manufacture of cigars in this country comes from Cuba. It is used principally to blend with domestic fillers and does not compete with the latter in any manner whatsoever. Any decrease in the importation of Cuban fillers would really result in a decrease in the consumption of domestic fillers. We should therefore encourage rather than discourage the importation of Cuban fillers.

Furthermore, Cuban tobacco is such as high-priced article that any increase in duty would result in either a tremendous decrease in its consumption, thereby reacting on the consumption of domestic fillers, as stated above, or, if consumed in any quantity, would reduce the price the manufacturer could afford to pay for the domestic filler used to blend with it, as it is impossible for him to increase the price of his cigars.

As for wrappers, the former rate of duty of $1.85 per pound affords ample protection to the domestic grower of wrapper leaf tobacco, as shown by the fact that the production and consumption of domestic wrappers has increased enormously in recent years, and their prices have advanced out of all proportion to those of other tobaccos. As a matter of fact, it is the only branch of the industry that has steadily expanded and therefore does not need additional protection.

If the above facts are true, it is evident that any increase in duties will so ncrease the cost of cigars as to necessitate an increase in the retail price of the inished product. Any attempt to raise cigar prices will decrease the output of he industry to such an extent as to cost the Government far more in the reduc-on in returns from internal-revenue taxes on cigars than it would gain in the ncreased duties on cigar leaf tobacco. Furthermore, owing to the reduction in he consumption of cigars, the importation of Sumatra and Cuban cigar leaf obacco would be greatly curtailed, so that in all probabilities there would be in actual loss in revenue to the Government.

We also beg to call your attention to the fact that the cigar and tobacco indus-ry now pays in stamp and import taxes over $310,000,000 annually, without ounting the income and other taxes paid by those engaged in the business. This, we submit, is far more than its fair proportionate share of the taxes ow levied by the Government, and it would be manifestly most unjust to urther burden it with any increases in duties or taxes.

Is Congress willing, therefore, to reduce the income of the Government, to increase the burden on the consumer, to lower the wages of cigar makers, to demoralize the entire cigar-manufacturing industry, and to injure the growers of domestic cigar leaf tobacco? Would not this be a most glaring instance of taxing an industry out of existence?

In conclusion, therefore, we would most earnestly urge that the pending bill be amended by the substitution of the rates of duties in force before the enact-ment of the present emergency tariff bill.

Very respectfully, yours,

JOHN R. YOUNG, Jr., *Secretary.*

CIGAR MANUFACTURERS' BRIEF AGAINST INCREASED DUTIES ON WRAPPER, FILLER, AND SCRAP TOBACCO.

Upon the demand of probably less than 100 tobacco growers, raising what is commonly but erroneously known as American Sumatra, and what is in fact, shade-grown wrapper tobacco, the House raised the duties on imported wrappers from $1.85 per pound to $2.10 for the unstemmed, and from $2.50 per pound to $2.75 for stemmed wrappers.

At the same time, and, apparently, upon no demand or suggestion from any tobacco grower, the House increased the duties on unstemmed filler tobacco from 35 cents per pound to 45 cents, and on stemmed filler from 50 cents to 60 cents per pound; also on scrap tobacco from 35 cents to 55 cents per pound. The present rates on fillers having been in force since 1882 and on scrap since 1913.

It is to be noted that the duty on wrapper tobacco was recently raised by the emergency tariff act without any previous notice or intimation to the cigar manufacturing trade, and without an opportunity to be heard. But as that act is merely of temporary nature, we are referring in this memorandum to the rates in force prior to its enactment and since 1898.

These increases in duties were passed by the House in spite of the facts—

That the whole cigar trade is in the throes of serious depression.

That its business since last December has declined over 20 per cent.

That 5,846 cigar manufacturers have gone out of business since 1914.

That the taxes on cigars have been raised since the war from a fixed rate of $3 per thousand to a graduated scale from $4 to $15 per thousand.

That at not time during the prosperous war days, while leaf tobacco increased from 64.08 per cent on Ohio tobacco, 196 per cent on Wisconsin, to 200 per cent on shade grown, and while the cost of labor, overhead, packing material, and all other items that go into the finished cigars, similarly climbed up to war-time prices, did the maximum increase in retail prices of cigars exceed 60 per cent of the prewar prices.

That the cigar industry has not only failed to keep pace with the growth of all other industries in this country, but that as a matter of fact our withdrawals for consumption in the fiscal year ending June 30, 1907, exactly 15 years ago, amounted to a little more than our withdrawals for consumption during the last fiscal year, as will be seen from the following figures:

Withdraws for consumption during the fiscal year ending—	
June 30, 1907	7,490,144,793
June 30, 1921	7,480,929,380
Decrease	9,215,413

Thus in the last 15 years the cigar industry shows a loss of 9,000,000 cigars.

And moreover not only did the number of cigars consumed in the last fiscal year fall below the consumption of 15 years ago, but the volume of business in dollars and cents has been alarmingly decreasing since last year.

The business on the higher priced cigars—that is, cigars retailing above 5 cents each—has been steadily going down, while those retailing at 5 cents or less, designated as class A, have been going up taking the place of the more expensive types.

A comparison of the withdrawals in October, 1921 (which is the last official report that we have), with the withdrawals in October, 1920, will be sufficient to demonstrate this point.

In October, 1920, class C cigars, retailing at between 8 and 15 cents, amounted to almost 46 per cent of the entire cigar business. In October, 1921, the same class of cigars went down to 39 per cent. Class B, the cigar that sells at between 5 and 8 cents each, constituted 28 per cent of the aggregate volume of business in October, 1920, and in the same month of this year it went down to 25 per cent; while class A cigars, which sell to the consumer at 5 cents and less, climbed up from 23 per cent in October, 1920, to 33 per cent in October last.

Thus cigars selling at 5 cents or less have gained 10 per cent of the whole cigar business, taking the place of the loss of business on grades of cigars that sell between 5 and 15 cents.

Surely these outstanding facts should be sufficiently convincing that the cigar industry can not stand the slightest increase in taxes, whether in the form of tariff duties or internal revenue.

The whole story of the cigar industry is told in the following chart:

DUTIES ON WRAPPERS.

As against the plea on behalf of 11,496 cigar manufacturers, there was a demand of the Connecticut, Florida, and Georgia farmers raising shade-grown tobacco, all told not more than about 100 in number, for an increased duty on imported Sumatra in order, as they claimed, to protect their shade-grown wrappers, which are sometimes erroneously referred to as "American Sumatra."

Do they really need additional protection because imported Sumatra is competing with their product? We emphatically say, "No."

They have raised their tobacco from $1.75 per pound in 1914 to $5.25 per pound in 1920 (House tariff hearings, p. 1580), in spite of the steady importation of Sumatra. (The present price being about $4 per pound.) They have increased production of Connecticut shade-grown wrappers from 1,200,000 pounds in 1910 to 7,467,000 pounds in 1918, the continued use of imported Sumatra notwithstanding (House tariff hearings, p. 1556). Subsequent figures which are not yet available will undoubtedly show a still further increase.

Do these facts show that they need additional protection? Certainly not.

What then is their motive for demanding additonal protection?

The answer is found in their own testimony.

Thus, at the House tariff hearing Mr. W. E. Smith, one of the tobacco growers' spokesmen, testified:

"Q. Mr. Garner. Mr. Smith, really what you want is $2.85 a pound levied as a tax at the customhouse on foreign importations in order that——

"A. Mr. Smith. On wrappers.

"Q. Mr. Garner. That you may get a better price for your tobacco?

"A. Mr. Smith. Yes, sir."

The cigar manufacturers have raised the prices of their products since the prewar times to a maximum of 60 per cent, while the growers have advanced their shade-grown wrappers during the same period from $1.75 in 1914 to $5.25, or 200 per cent, in 1920, the price is still maintained at $4 per pound, which is an increase of 129 per cent, and they ask for increased duties for the conceded purpose of getting still higher prices for their wrappers.

Indeed, this is not the first time that the very same tobacco growers' association demanded increased duties on wrapper tobacco, nor is their present argument in support of their demand altogether new. In 1913 they appeared before the Ways and Means Committee and submitted a similar demand, based upon the same reasoning, as may be seen from the following quotations of the arguments on both occasions:

EXCERPTS FROM THE BRIEF OF THE NEW ENGLAND TOBACCO GROWERS' ASSOCIATION FOR INCREASED DUTIES ON WRAPPERS.

1913.

[House tariff hearings, p. 2531.]

These expensive methods, worked out by the Government at an enormous expenditure of the people's money, have been, under the present customs tariff on wrapper tobacco, adopted to a large extent by many of the agriculturists in the several tobacco-producing States who have invested millions of dollars in proper lands for its growth, buildings, and equipment for its production, that a cigar wrapper leaf tobacco that would represent the most advanced type of wrapper might be produced that would acceptably take the place of the leaf now so largely imported. And we respectfully submit that such a leaf has been developed in this country and is being produced in increasing quantities from year to year and without the rate of customs duty now collected from such imported leaf it would be no longer possible for us to produce this high-grade, expensive cigar leaf, without which the labor and expenditures of this Government for years and the millions already invested by the American people in this industry would be forever lost, and the lands and property used in its production practically valueless.

1921.

[House tariff hearings, p. 1598.]

These expensive methods, worked out by the Government at an enormous expenditure of the people's money, have been, under the present customs tariff on wrapper tobacco, adopted to a large extent by many of the agriculturists in the several tobacco-producing States. The New England and Florida agriculturists have developed a cigar-wrapper leaf of the most advanced type and have invested their money in land, buildings, and equipment for the purpose of growing and marketing the product. Unless sufficient protection is maintained, the millions already invested by the American people in this industry will be forever lost, and the lands and property developed for the growth of tobacco will become practically worthless.

THE UNJUSTNESS OF THEIR CONTENTIONS.

Thus they argued in 1913, as they now contend, that unless the duty on wrapper be raised, the shade-grown industry would be destroyed. The duty was not raised in 1913 or since then, and yet the production of shade-grown wrapper in Connecticut alone has grown from approximately 2,000,000 pounds in 1913 to over 7,000,000 pounds, the present yield, while the prices have, during the same period, advanced from $1.75 per pound to $5.25 per pound. It may be noted here that the price has since been reduced to $4 per pound.

The fact is, as is clearly demonstrated in our brief (House tariff hearings, p. 555), that imported Sumatra does not compete with shade-grown wrappers, which are sometimes called American Sumatra. The former is used for one type of cigars, while the latter is used for an entirely different type of cigars. Neither is used as a substitute for the other.

These growers raising largely the shade-grown type of wrappers, which, as already stated, are commonly but erroneously known as American Sumatra, still contend as they contended years ago when the development of shade-grown tobacco in this country was first entered upon—that they must have higher tariff duties on Sumatra wrapper in order to protect the shade-grown industry. But their contentions are clearly refuted by the very growth of the shade-grown industry within the last 10 years or so, the importations of Sumatra notwithstanding.

Thus, as will be seen from the following tables covering a period of 10 years, from 1910 to 1920, that while we have continued to import Sumatra at the rate of between six and seven million pounds per annum—which is sufficient to cover between three and three and one-half billions of cigars, or between 40 and 47 per cent of our entire consumption of cigars—the shade-grown industry in the Connecticut district alone, which includes Massachusetts, has grown from

1,000 acres under cultivation in 1910 to 6,150 acres in 1918, and undoubtedly a still larger acreage in 1920 (the figures for 1919 and 1920 not being available), with an increased yield of wrappers from approximately 1,200,000 pounds in 1910 to 7,467,000 pounds in 1918.

We have no official figures showing the production of shade-grown tobacco in Georgia and Florida for the same period, as no official statistics in that respect have been published. But according to the report of the department of agriculture of Florida it appears that in 1917-18 Florida produced 2,123,427 pounds of shade-grown tobacco.

The Federal Department of Agriculture also reports a total production of cigar tobacco in Florida and Georgia in the year 1919 amounting to 5,890,[illegible] pounds, the great bulk of which, as we know, was wrappers; so that, adding the production of wrappers in Georgia and Florida to the 7,000,000 pounds of wrappers produced in Connecticut, it would show a total production of wrappers amounting to over 12,000,000 pounds. And all of that enormous production of a type of wrapper, which it is claimed competes with the imported Sumatra, has developed within the last 10 years, while our importations of Sumatra were kept up almost at a uniform rate of between 6,000,000 and 7,000,000 pounds per annum.

It is thus clearly shown that the importation of Sumatra wrappers has in no way interfered with the development of shade-grown wrappers in this country.

Acreage of shade-grown tobacco in the Connecticut Valley.

	Acres grown.		Acres grown.
1900	⅛	1910	1,[illegible]
1901	41	1911	1,[illegible]

[1] Figures of production not yet available. This represents the number of cigars [illegible] drawn for consumption during the fiscal years ending June 30. All other figures [illegible] production are for the calendar year.

THE DIFFERENTIAL UNDER THE OLD DUTY IS AMPLY SUFFICIENT TO PROTECT HOME GROWN WRAPPERS.

A great deal has been said about the difference in the cost of producing domestic shade-grown wrappers and imported Sumatra wrappers. It seems to [illegible]

however, that the important question to be considered is not what it costs to produce shade-grown wrappers as against the cost of imported Sumatra, but the difference in the cost of covering a thousand cigars with either of the two types of wrappers, for manifestly the cost of the wrapper on a cigar, like the cost of all other material, must ultimately be reflected in the price of the finished cigar.

At the present prices of both shade-grown and Sumatra a thousand 10-cent or higher-priced cigars can be readily covered with shade grown wrappers at a cost of between $8 and $9, while to cover the same grades of cigar selling at the same prices with imported Sumatra, dutiable at $1.85 per pound, costs between $10 and $12 per thousand.

It is entirely immaterial what it costs to produce shade-grown wrappers, for the fact is that manufacturers desiring to use the imported Sumatra on their 10-cent or higher priced cigars must pay between $2 and $3 more to cover a thousand cigars than it would cost them to cover the same cigars with the domestic wrappers.

Here, then, is a differential of between $2 and $3 in the cost of wrappers for a thousand cigars under the old tariff of $1.85 per pound, which, I believe, is more than sufficient to protect the shade-grown industry.

In regard to the lower priced cigars—that is, cigars retailing at between 5 and 10 cents—shade-grown wrappers are in no way an important factor, for most of these grades of cigars are and necessarily must be covered with imported Sumatra, because shade-grown wrapper does not mix well with filler tobacco grown in the United States. No manufactuer is known to have ever succeeded in making a combination of shade-grown wrappers with domestic fillers and producing a satisfactory cigar.

Most shade-grown wrappers are used on cigars containing Havana fillers, Porto Rico fillers or a blend of the two—on cigars which can not be sold at less than 10 cents, shade-grown tobacco therefore does not come into serious competition with the imported Sumatra that is used on cigars that are selling below 10 cents.

Surely, as between the comparatively few wrapper growers producing about 10,000,000 pounds of tobacco per annum, out of a total of about 1,500,000,000 pounds raised in this country, and cultivating about 10,000 acres out of a total of 1,900,000 acres of tobacco land under cultivation, on one side, and the 11,496 cigar manufacturers, employing 200,000 laborers and using approximately 154,000,000 pounds of tobacco per annum, on the other side, the interest of the latter are of far greater importance to the country's commerce and industry than that of the former.

DUTIES ON FILLERS.

What we have said in regard to the increased duties on wrappers applies with equal if not more force to the increased duties on filler tobacco, whether in leaves or in scrap.

The increases in duties of 10 cents per pound on the leaf fillers and 20 cents per pound on scrap fillers would add to the cost of production from $2 to $2.50 per thousand on cigars containing 100 per cent Havana filler and a proportionately smaller amount on blended cigars mixed with Havana fillers.

We believe that we have already demonstrated that the cigar industry can not possibly absorb these added items to the cost of production.

Surely, in face of the loss of over 20 per cent of cigar business since last November, bringing the cigar industry back to where it was about 15 years ago, there can not be added 1 cent to the selling prices of cigars without bringing disaster to the industry.

These additional duties would only force manufacturers to reduce the quantity of Havana fillers used in their cigars, thus changing the quality of their merchandise and ruining, if not altogether destroying, established brands or trade-marks of immense value.

The Government will surely receive no additional revenue from these increased duties, while the industry would suffer incalculable injury, not speaking of the fact that millions of cigar consumers would necessarily be deprived of the enjoyment of the smokes of the quality that they have been accustomed to.

As far as the records show, no American tobacco grower has asked for any additional protection on filler tobacco. No American farmer has complained that the imported cigar fillers are hurting American tobacco growers.

SCRAP TOBACCO—WHAT IT IS, WHAT IT IS USED FOR, AND THE DUTY THEREON

The word "scrap" as applied to tobacco is by no means used as an arbitrary or fanciful designation, it is used in its true literary sense to describe the ofa the shorts, the fragments, the scrap, or the left-overs from the tobacco leaves placed in cigars.

Manifestly, the scrap of tobacco, like the scrap of all other substances, can not possibly have the value of the original material that it comes from, nor can the article made up of scrap have as much value as an article made up of the material in its original form. And so in the tobacco industry, imported scrap is used for the cheaper grades of cigars and in little cheroots that sell at from 30 to 35 cents per package of 10.

The pending tariff bill provides for an increase in the duty on scrap tobacco from 35 cents to 55 cents per pound. Using about 12 pounds of scrap to a thousand cigars, the increased duty would add about $2.40 per thousand to the cost of production of cigars made of imported scraps.

Scrap is also a manufactured tobacco put up in small packages for sale to the consumer for chewing or pipe smoking. But the quantity of imported scrap used for that purpose is indeed insignificant. However, had this provision for increased duty on scrap tobacco been framed to apply only to manufactured tobacco put up in packages ready to be sold to the consumer in competition with domestic manufactured scrap tobacco there would, of course, be no objection. But, according to the language of the paragraph, the increased duty applies to both "manufactured or unmanufactured tobacco." Thus, scrap tobacco imported into this country by cigar manufacturers purely as filler tobacco to be used in the manufacture of cigars would be subject to the additional duty of 20 cents a pound.

No American tobacco grower has asked for additional protection on the tobacco imported from Cuba, for it is indeed well recognized that the importation of Cuban tobacco is a benefit rather than a detriment to American tobacco because it is the Cuban tobacco when used as a blend with domestic tobacco that gives the cigar a flavor or aroma that can not be obtained in any other way.

Indeed, we can hardly understand the attitude of the Ways and Means Committee in raising the duty on Sumatra wrapper and on scrap fillers, both of which are used in the poor man's smokes. The great bulk of Sumatra wrapper is used on cigars selling at 8 cents or less, while most of the imported scrap tobacco is used in cheroots or little cigars selling at less than 5 cents each (10 for 35 cents). It is needless to say that the margin of profit on these cheap articles must necessarily be exceedingly small, and that neither the manufacturer nor the jobber or retailer can absorb the least increase in cost or taxes.

Why, then, impose these additional burdens on the cigar industry, when as it must be clearly apparent, the manufacturer can not possibly absorb them? And to shift them on the consumer would mean a still further decline in business, which must not only result in disaster to the industry, but in a minimized revenue to the Government as well.

THE SMALL MANUFACTURER.

There is another phase of the situation to be considered—that is, the position of the small manufacturer. The big manufacturer, who makes several hundred million cigars a year, may be able to get along with a small profit, although operating on a small margin of profit in the tobacco business, where any change in atmospheric conditions or any slight mistake in the treatment of the tobacco may cause sufficient deterioration of the material to wipe out the entire profit and produce a substantial loss—is like skating on thin ice. But can the little fellow, who makes 10,000 cigars a week or 500,000 cigars a year, exist unless he makes a reasonable profit?

It will be seen from the records of the Internal Revenue Department that while there were 17,137 cigar manufacturers in business in 1914, there were only 11,291 manufacturers in business in 1919. Thus, 5,846 manufacturers have gone out of business since the war. What was the cause of it? The explanation is, indeed, simple. While the big manufacturers were able to withstand the increased cost of production and the higher rates of taxes, with the increased capital necessarily required in the carrying of high-priced material

ecause of their large outputs, the small man could not stand it and hence his nforced retirement from business.

Any incease in duties on wrappers, fillers, or scraps would impose a further ardship upon the small man not only because of the curtailment of his already inimized profit, but because of the additional cash investment required in the ayment of the increased duties.

This phase of the situation is respectfully brought to your attention not erely as a plea for the small man, but for the purpose of demonstrating the loseness of the margin of profit under which we have been operating since the ar. For with a reasonable profit on the business the small man can readily hrive, prosper, and succeed in spite of the competition of the large concern, ut with the profits minimized, as they have been minimized since the war, he difficulties of the small man were, indeed, more than he could stand, as is videnced by the fact that over 33 per cent of the small manufacturers have ithdrawn from the business since 1914.

ADDITIONAL DUTIES SHOULD BE ELIMINATED.

In view of the facts and circumstances thus presented, we respectfully urge hat any increase in the tariff duties on tobacco would cause disaster to the ndustry, as well as loss of revenue to the Government, and would in no way enefit the American tobacco growers, whose interests are more than sufficiently rotected under the present tariff rates, for the imported tobacco not only does ot compete with the domestic tobacco but is indeed essential in order to keep p our present rate of consumption.

All of which is respectfully submitted by Cigar Manufacturers Committee of he Tobacco Merchants' Association of the United States.

STATEMENT OF MARCUS L. FLOYD, REPRESENTING THE NEW ENGLAND TOBACCO GROWERS' ASSOCIATION AND THE FLORIDA AND GEORGIA TOBACCO GROWERS' ASSOCIATION.

Mr. FLOYD. Mr. Chairman and gentlemen, I think in coming here I probably represent one of the most important industries in this country, and that is the production of cigar-leaf tobacco. I want to say to that part of the committee that is here, and I will not make any apology to the part that is not here, that in order to stand well with you gentlemen I am going to tell you that I will not take up more than 10 minutes of your time. There are certain things that I want to call your attention to, but I will be very brief.

There is a letter here addressed to your chairman, with some figures attached to it, that I would like to have inserted in the record at this point.

Senator McCUMBER. That may be done.

(The documents referred to are as follows:)

AUGUST 18, 1921.

Hon. BOIES PENROSE,
Chairman Committee on Finance, United States Senate.

MY DEAR SENATOR: I herewith beg to hand you a memorandum showing comparative costs of raw material that enters into the manufacture of cigars. These figures show clearly that all grades of cigars, from the cheapest up to and including the 2-for-25-cents class, can be manufactured for a much less cost than obtained during the years 1919 and 1920.

Of course, the manufacturer does and will claim that he is stocked up with raw material purchased at prevailing high prices of 1919 and 1920, which in many cases is probably true. However, the decrease in cost of labor applies now and far more than offsets the advance in import duty we are asking for. Again, it must be borne in mind, we do not ask advanced import duty on tobaccos they do not own and have in stock, but on tobaccos which they will buy and bring into this country, tobaccos that no doubt will be purchased for much less money than the tobaccos they now have in stock.

Our statement shows that values of domestic leaf, whether wrapper, binder, or filler, have shrunk at least 20 per cent, while Porto Rico and Cuba leaf have shrunk in value from 30 to 40 per cent. Therefore, the claim on the part of the manufacturer, that if the import duty is changed from $1.85 to $2.50 per pound, it will force the so-called 8-cent cigar into a 9-cent class. This claim is preposterous and unjustifiable.

In my statement before the Ways and Means Committee of the House I called attention to the fact that a manufactured cigar was purely a fancy article, without intrinsic or fixed value. The making of prices on the part of the manufacturer is largely arbitrary. For example, a cigar that retails for 5 cents to the consumer may have been bought by the jobber from the manufacturer at anywhere from $28 to $32 per thousand. This cigar may retail at 5 cents or six for 25 cents. Now, then, the strictly 5-cent cigar the jobber may buy from the manufacturer at from $34 to $38 per thousand.

The cigar that retails at three for 25 cents the jobber buys from $40 to $55 per thousand, and the strictly 10-cent cigar he pays $55 to $65 per thousand for, and the two for 25 cents for $65 to $80 per thousand. You will notice as the retail prices advance a large margin between the lowest and highest jobbing price on that particular class of cigars.

I further made the statement before the Ways and Means Committee at which meeting there were a number of manufacturers and importers, that none of them, be they ever so experienced, could by examination or trial tell the difference between a $28-per-thousand cigar and a $32-per-thousand cigar. These cigars to be, of course, without trade-mark or brand. This is absolutely true regarding every class of cigar. I defy any manufacturer or importer to tell me by close examination whether a certain cigar should sell at wholesale for $34 to $36 a thousand, or in the high-class cigars, $80, $90, or $100 per thousand.

In concluding I wish to suggest, inasmuch as it seems to be clearly the purpose of the present Congress to obtain further revenue from tobacco, that this be done as far as may be by increasing the import duty; to levy an internal-revenue tax will burden the consumer without benefit to any branch of the tobacco industry; to levy an import duty or tax will place the same burden on the consumer, with positive benefit to farmers who produce similar tobaccos in this country.

Now, it is for you gentlemen to decide which you will choose: A tax that will burden all and benefit none or an import tax that will burden all and at the same time benefiting one of the most important industries of this country.

Very respectfully

M. L. F[illegible]

QUANTITIES OF LEAF TOBACCO REQUIRED FOR THE AVERAGE-SIZED CIGAR.

Wrapper: 1¾ to 2 pounds of Sumatra tobacco, or 1½ to 2 pounds of Florida and Georgia tobacco, or 4 to 10 pounds of Connecticut tobacco.

Binders: 5 to 6 pounds of Connecticut tobacco, or 6 to 7 pounds of Wisconsin or New York State tobacco.

Fillers: 18 to 20 pounds of domestic filler, or 16 to 18 pounds of Havana tobacco, or 16 to 18 pounds of Porto Rican tobacco.

PRICES FOR LABOR MANUFACTURING CIGARS IN PENNSYLVANIA.

For cigars known as the 8-cent or 2-for-15-cents grade: 1914, $7 per thousand; 1919, $11 per thousand; 1921, $9 per thousand; decrease since 1919, 18 per cent.

For cigars known as the 5 and 6 cent grade: 1914, $5.25 per thousand; 1919, $9 per thousand; 1921, $6 to $7 per thousand; decrease since 1919, 22 per cent.

For cigars known as the 10-cent straight or 2-for-25-cents grade: 1914, $9 per thousand; 1919, $15 to $16 per thousand; 1921, $10 to $12 per thousand; decrease since 1919, 20 per cent.

In the old ninth district of Pennsylvania, where low-priced cigars are being manufactured, the cost of labor is from $1 to $3 per thousand less than above specified. In other section of the country the scale per thousand varies from above schedule, ranging from $8 to $12 in 1914, $16 to $22 in 1919, and $12 to $20 at the present time, depending on the locality, also the size, shape, and general workmanship of the cigars.

The actual cost of labor for manufacturing cigars is about 20 per cent less than in 1919 and 1920, and there is also a decided reduction in the cost of cigar boxes, labor, etc., all of which will be the means of lowering manufacturing costs.

Average values of cigar leaf tobacco.

	1919-20, at $1.85 duty.	1921, at $1.85 duty.	192[illegible], at [illegible] duty.
2 pounds Sumatra tobacco	$8.20	$7.70	[illegible]
6 pounds Connecticut broad-leaf binders	5.70	4.50	[illegible]
18 pounds Havana tobacco	27.54	21.24	[illegible]
Labor	20.00	17.00	[illegible]
Total	61.44	50.44	[illegible]

PORTO RICAN FILLERS, TWO-FOR-A-QUARTER CIGAR.

	1919-20, at $1.85 duty.	1921, at $1.85 duty.	192[illegible], at [illegible] duty.
2 pounds Sumatra tobacco	$8.20	$7.70	[illegible]
6 pounds Connecticut broad-leaf binders	5.70	4.50	[illegible]
18 pounds Porto Rico fillers	28.80	15.30	[illegible]
Labor	20.00	17.00	[illegible]
Total	62.70	44.50	[illegible]

Mr. FLOYD. I think that covers clearly and concisely our contentions, and I think you will fully understand it.

The gentleman who just preceded me stated that we sold our highest grade of tobacco for $1.75, but at the high peak at $5 [illegible] pound. I just want to ask the gentleman if he will tell the committee the highest price of Sumatra tobacco in bond.

Mr. CULLMAN. I have sold it for $5.50 to $5.70.

Mr. FLOYD. In bond?

Mr. CULLMAN. In bond.

Mr. FLOYD. Tobacco produced in the island of Sumatra with the cheapest labor on earth, and yet in bond they sold it at $5.50 and have not committed any crime; and we sell it at $5 a pound at the peak of high costs, and we are charged with being inhuman [illegible] unkind.

Mr. CULLMAN. $5.50 a pound, plus a duty of $2.35 during the emergency bill.

Mr. FLOYD. If we committed a crime in selling tobacco that [illegible] us the peak of high prices and everything that enters into production, what kind of a crime have these gentlemen committed who [illegible] it at $5 in bond, produced by the cheapest labor on earth?

That is something to think of, gentlemen. Now, that is a tempest in a teapot. Two and a half—what we hope to get—is just [illegible] half a cent a cigar. You had a gentleman here a while ago who [illegible] you he bought bales of tobacco at 50 pounds a bale, for which [illegible] paid $15 a pound. Instead of coming to fight about that little amount, why in God's name does he not go back and try to buy [illegible] tobacco cheaper? Did you ever stop to think that that 50 cents [illegible]

Ways and Means Committee allowed us would amount to one-fifth of a cent a cigar, on the amount of $2.35?

You will see in that memorandum all those figures, and I challenge these gentlemen here now to tell me, without seeing the brand of the cigar, whether it would sell at $32 or $34. They can not do it unless it is a brand known to them. They can not tell whether it is $80 or $85 or $90. It is purely a fancy article, purely arbitrary on the part of the manufacturer, whether he asks $80 or $85, and no one can tell that. I will leave you with that statement. I could go over a lot of these things, but I have stated that I would not take too much of your time.

Senator LA FOLLETTE. You are doing pretty well. Go ahead.

Mr. FLOYD. I do not want to burden you. You have been very patient here to-day, and my little brief will tell you all that we have got to say, possibly. If you will take up the other brief we submitted to the Ways and Means Committee that will tell you our attitude.

Senator McLEAN. If you want opportunity to refute any matters of fact stated here to-day, you ought to have that privilege, because they have made some statements as to acreage, etc., which you might want to speak about.

Mr. FLOYD. Gentlemen, that, after all, is merely a tempest in a teapot. That $2.50 that we ask would be half a cent a cigar, and the duty we ask as an addition to the $1.85 would be one-fifth of a cent a cigar. The duty that the Ways and Means Committee saw fit to give us was one-tenth of a cent a cigar. Now, is that a burden? Is that going to kill the industry? Is that going to stop the importation of tobacco—one-tenth of a cigar? When they tell you here the enormous cost of labor and the enormous cost of raw material, I want to tell you right now—and those gentlemen will not deny it—that we can go out with honest cash and buy tobacco to-day cheaper than we ever could in 10 years. Is that true?

Mr. CULLMAN. That is correct.

Mr. FLOYD. Now, then, labor has come down about 20 per cent. You will find that all figured out for you there in that memorandum. Materials have come down enormously. A little over a year ago Porto Rican fillers were selling for $1.60 that you can buy for 60 cents now.

Mr. CULLMAN. About 70 cents or 75 cents.

Mr. FLOYD. And yet they say if you put this extra duty on they have got to advance the price of cigars. Isn't that funny? [Laughter.] It is a joke, gentlemen. When you add one-tenth of a cent, one of the Senators wants to stand pat. I don't. I want to protect. One Senator wants to stand pat——

Senator LA FOLLETTE. He is not all of the committee.

Senator McLEAN. It has been stated that the importations of Sumatra have greatly decreased in the last month or two.

Mr. FLOYD. Yes. Do you think they are going to bring it in for $2.35 when they think you are going to let them bring it in at $1.85? When the whole country is depressed, these men want to put the price up.

That reminds me of a little story. I have got an oil tank out at my place, and a few days ago a Standard Oil man came around and

said: "You had better let me fill that tank, because the price of gasoline is going up 2 cents."

If they are going in these times to advance the price of gasoline 2 cents, I have got no patience with them. I told that man, if you will pardon the expression, that he could go to hell with his advance.

If these Sumatra men in these trying times are advancing prices, I have got no respect for them. We are taking our medicine. We sold fillers at $3.50 last year in Florida, and I will sell you all you want to-day at $2.50. These Sumatra men say they have got to ask more, because they have got to pay more. Let me tell you they have a cheap class of labor, and I know something about that labor.

Those people in Sumatra wear about the same amount of clothing that Eve did in the Garden of Eden. They live on 15 to 25 cents a day and eat rice and coconut meal. You gentlemen do not want to reduce our people in this country to that kind of a standard of living. If you do what these people ask, you are going to reduce the standard of living in this country. I have very little patience with a man who in 1921 will stand up here and ask for free trade. I probably would make a poor politician, but I can not help believe that we Americans ought to stand together as Americans.

Senator McLEAN. You are a southern protectionist?

Mr. FLOYD. I was until I was nearly 40 years old, but now I am not, and I will tell you a little story about that. I appeared before the Ways and Means Committee with the Southern Tariff Association, and every gentleman, some 40, I believe, got up and made some sort of an apology such as this: "While I am a Democrat, I do believe we ought to have protection."

I said that reminds me of a man who is a Presbyterian and believes in immersion. Protection is one of the principles of the Republican Party; it is a part of their faith, and when I left the Democratic Party I left it because I changed my faith. I believed in protection then, and I do now, and I do not believe that rice ought to be brought in free, and I do not believe that cotton ought to be brought in free, or lemons, or oranges, or any other products that we can produce in this country, and by reason of bringing them in free put our people in absolute competition with that class of labor. I am preaching, I think, to Republicans, and I wish that the gentlemen from Missouri were here.

Mr. CULLMAN. Do you know what the cost of the last crop of Sumatra averaged?

Mr. FLOYD. Well, if it cost anything like what it cost us, there must be some bad management, because there was no increase in wages.

Mr. CULLMAN. There was.

Mr. FLOYD. What do they pay?

Mr. CULLMAN. They were formerly paid with Mexican dollars, when they were worth 50 cents. To-day they are paid in the same coin, which is worth about a dollar in gold, so their wages have practically doubled. The cost of Sumatra tobacco last year for the entire crop was 75 cents per pound——

Mr. FLOYD. Finished?

Mr. CULLMAN. Finished; and shade-grown tobacco was $1.25 per pound finished.

Mr. FLOYD. You have got another guess coming on that.

Mr. CULLMAN. I took that statement from your own people.

Mr. FLOYD. Another thing, gentlemen, that you must bear in mind, when we are talking about $2.50; you must keep in mind all the time that you are only protecting a very small percentage of our production. The Sumatra is over 15 to 20 per cent——

Mr. CULLMAN. There were approximately 5,000,000 pounds of tobacco.

Mr. FLOYD. And that is about what per cent of the crop?

Mr. CULLMAN. Not to exceed 15 per cent.

Mr. FLOYD. You are protecting us on about that per cent of tobacco—about 15 per cent. What per cent do we get out of high-grade Habana seed——

Mr. CULLMAN. Is it not a fact that we raise in the United States about 200,000,000 pounds of cigar leaf?

Mr. FLOYD. Yes.

Mr. CULLMAN. And is it not a fact that you only raise 10,000,000 pounds of shade-grown in Florida?

Mr. FLOYD. Yes; but I want to call your attention to one thing. In 1918 they brought to this country—the importation got down to about 12,000 bales. Is that right?

Mr. CULLMAN. From where?

Mr. FLOYD. From Sumatra.

Mr. CULLMAN. No, sir. During the war, under the provision of the United States Government, there were import licenses granted to import 33,000 bales of tobacco——

Mr. FLOYD. In 1918?

Mr. CULLMAN. In 1919.

Mr. FLOYD. I said in 1918.

Mr. CULLMAN. In 1919, when there was no trading between Holland and the United States, about the same amount was imported direct from India to the United States.

Mr. FLOYD. I think the records show 12,000 to 15,000.

Mr. W. L. CROUNSE. There were about 33,000 bales.

Senator MCLEAN. The quantity from the Netherlands in 1920 was 1,512,000 pounds, and in 1921 it was 7,868,000.

Mr. CROUNSE. Those importations were from Holland, whereas these importations were from Sumatra and Java.

Mr. FLOYD. Do you find the figure for 1918?

Senator MCLEAN. No; it is not given. But they show a tremendous increase in the importation.

Mr. FLOYD. During that time we made more cigars in this country than we ever made before or since. Now, I will tell you what happened here. We were asked by the Shipping Board to come down and bring them figures to show exactly the status of the tobacco business in this country, whether there were wrappers enough, and whether it was necessary to use American bottoms to bring them in in order to save the industry. At a good deal of expense and trouble we got the statistics—you told me to go on, Mr. Chairman.

Senator MCCUMBER. The 10 minutes has grown to about 15 minutes already, but I appreciate the fact that it is very hard for you to cut your statement down.

Senator MCLEAN. The other side had all the afternoon.

Senator McCUMBER. I have an engagement at this time, and I will ask you to excuse me, but if some of the other Senators would like to stay, Mr. Floyd can continue his statement.

Mr. FLOYD. I would like you to hear what I have to say, Senator, and then I will be through. It is very short. As I was saying, we brought those figures at great trouble and expense before the Shipping Board, and they gave us a good hearing and cross-questioned us, and in the meantime the boats of the Sumatra tobacco people were at the island of Sumatra being loaded. How they did that I do not know.

Mr. CULLMAN. Is it not a fact that the department in Washington, recognizing the necessity of the manufacturers using the Sumatra tobacco, granted an import license for a certain quantity of that tobacco to be imported?

Mr. FLOYD. Sure; but the farce of it was, why did they have us come down here after they had granted that? That makes a fellow feel a little small when a thing like that happens.

I think that is all, gentlemen. I thank you.

INDEX TO SCHEDULE 6.

NAMES.

SUBJECTS.

HEARINGS

BEFORE THE

COMMITTEE ON FINANCE

UNITED STATES SENATE

ON THE PROPOSED

TARIFF ACT OF 1921

(H. R. 7456)

SCHEDULE 7

AGRICULTURAL PRODUCTS AND PROVISIONS

SCHEDULE 8

SPIRITS, WINES, AND OTHER BEVERAGES

Revised and Indexed

WASHINGTON
GOVERNMENT PRINTING OFFICE
1922

COMMITTEE ON FINANCE.

BOIES PENROSE, Pennsylvania, *Chairman.*

PORTER J. McCUMBER, North Dakota.
REED SMOOT, Utah.
ROBERT M. LA FOLLETTE, Wisconsin.
WILLIAM P. DILLINGHAM, Vermont.
GEORGE P. McLEAN, Connecticut.
CHARLES CURTIS, Kansas.
JAMES E. WATSON, Indiana.
WILLIAM M. CALDER, New York.
HOWARD SUTHERLAND, West Virginia.

FURNIFOLD M. SIMMONS, North Carolina
JOHN SHARP WILLIAMS, Mississippi.
ANDRIEUS A. JONES, New Mexico.
PETER G. GERRY, Rhode Island.
JAMES A. REED, Missouri.
DAVID I. WALSH, Massachusetts.

LEIGHTON C. TAYLOR, *Clerk.*
W. B. STEWART, *Assistant Clerk.*

NOTE.

Believing the greatest demand for the Tariff Hearings before the Senate Finance Committee on H. R. 7456 will be only for those schedules containing the particular items in which each individual is interested, the preliminary prints have been revised and indexed and printed by schedules.

The hearings are paged consecutively and comprise the following separate documents:

American Valuation.
Dyes Embargo.
Schedule 1.—Chemicals, Oils, and Paints.
Schedule 2.—Earths, Earthenware, and Glassware.
Schedule 3.—Metals and Manufactures of.
Schedule 4.—Wood and Manufactures of.
Schedule 5.—Sugar, Molasses, and Manufactures of.
Schedule 6.—Tobacco and Manufactures of.
Schedule 7.—Agricultural Products and Provisions } combined.
Schedule 8.—Spirits, Wines, and Other Beverages }
Schedule 9.—Cotton Manufactures.
Schedule 10.—Flax, Hemp, and Jute, and Manufactures of.
Schedule 11.—Wool and Manufactures of.
Schedule 12.—Silk and Silk Goods.
Schedule 13.—Papers and Books.
Schedule 14.—Sundries.
Schedule 15.—Free list.
Special and Administrative Provisions, and Appendix containing briefs received too late for printing in the volume containing the hearings upon the various schedules.

LEIGHTON C. TAYLOR, *Clerk*.

SCHEDULE 7.

AGRICULTURAL PRODUCTS AND PROVISIONS.

AGRICULTURE IN GENERAL.

STATEMENT OF PROF. THOMAS C. ATKESON, WASHINGTON, D. C., REPRESENTING NATIONAL GRANGE, PATRONS OF HUSBANDRY.

Prof. ATKESON. Mr. Chairman and gentlemen of the committee, my name is T. C. Atkeson, representing the National Grange.

I am not here as an individual, but as a representative of an organization of farmers that has a half century of experience and observation behind it, with a membership of approximately 1,000,000 people. This organization has lived through a great many tariff bills and other bills, and it has lived through calamitous times like these and other calamities, and it is still in existence and in some measure performs its function. It will hold its next, its fifty-fifth, annual session at Portland, Oreg., beginning next week.

The CHAIRMAN. How long have you been at the head of this organization, Professor? You are president now?

Prof. ATKESON. I am not master of the grange at all. Mr. S. J. Lowell, of New York, is the present master. I am the Washington representative of the grange. I have been a member of the grange for more than 40 years and have served it in many official capacities.

Our organization in its experience has had a good deal to do, of necessity, with problems involved in the tariff—in taxation and support of the governmental machinery in all its relations—and some 30 or 40 years ago we undertook to determine where our organization stood and, so far as it represented the farmers of the country, where the farmers stood on the question of tariff, and particularly protective tariff, or the protective principle involved in the tariff problem. We found that we had a good many men in our membership who were high protectionists, men who were free traders, men who favored a tariff for revenue only with incidental protection, and men who favored tariff for protection with incidental revenue.

We found that with this various membership in our organization it was impossible for us to determine or for us to take the position for or against protection, and as impossible as it would have been to take a position for or against the Methodist or the Baptist or the Presbyterian churches, in view of the dogmas and doctrines that come into our organization through the affiliation of our membership with all these churches and in the various relations of life, and

that it was absolutely impossible to reach a definite or anything like a satisfactory decision in favor of problems of that kind.

We are absolutely nonpolitical in our organization. I think that we would not have lived so long if we had been a little more political than we have been. The experience of other organizations that got into politics has been that they got out of business sooner or later.

Being a nonpolitical organization we have not tried to settle the tariff policy of the country. But some 30 or 40 years ago our organization adopted a resolution reading about like this: That so long as protection is the policy of the Government, we demand for agriculture and agricultural products a fair and equal protection under the tariff laws of the country.

In one form of words or another, for 30 or 40 years we have reiterated that position, and that is what I am here to reiterate to-day.

In the early discussion of the tariff question much was said about raw materials being placed on the free list, and that manufactured or finished products should have a protective tariff, and I was confronted, and our organization was confronted, in an effort to determine what constituted a "raw material." And I am wondering if there is any Senator wise enough to tell us what is a raw material that has to be admitted tariff free. Perhaps any of you at first thought would undertake to answer that question. But it is not so easy of answer.

In my conception the only raw material is the thing as the Creator made it, where he made it, if you want a definition of raw material—it may be iron in the mine, or coal in the mine, or plant food in the soil, in the air, or in the water; all those things, in my conception, are raw materials, and nothing else is.

In order to produce a crop of corn or wheat the farmer must plow and cultivate and harvest and take care of his crop. He has done something with what nature provided; that is, his farm has been a factory. He has converted into a commercial commodity some of those properties suitable for immediate use and consumption, others requiring further manipulation and manufacture on the way to the ultimate consumer. But so far as the farmer is concerned, the products of his farm are the products of his factory and are absolutely as essential as the product of any factory can be to the product of that factory. A factory takes a commodity at some stage of its existence and adds something to it, or does something to it, that further fits it for final consumption; and every manufacturing interest would like to assume that the thing at the place where it takes it is raw material and would like to have it on the free list, and at the place where he lets it go that it be considered the finished product, and he would like to have it protected.

So we repudiate entirely the old dictum of tariff philosophers—that the product of the farm is a raw material. So far as the farmer is concerned it is a finished product; it is an eternally finished product—at the place where he lets it go, whatever it may be, whether it is consumed in the form in which he lets it go or whether somebody adds something to it following his disposition of it.

I would like for this committee in considering agricultural tariffs to keep that in mind.

Then, another question arises, which is fundamental to fair consideration of this question, and that is whether a tariff can protect an agricultural commodity or not and just to what extent it may be protected or its price increased—and that is what you mean by protection, its price being increased—and you will find a great diversity of opinion among Senators and Congressmen, as well as among farmers and economists everywhere, as to the things that may or may not be protected by a tariff.

Therefore, we fall back on this and the enunciation of the National Grange, that is 30 or 40 years old, and depend largely upon the wisdom and the honesty of purpose and the patriotism of the American Congress to see that agriculture is not discriminated against and, so far as possible under the tariff schedules, to see that the products of agriculture receive a fair and just protection so long as protection is the policy of the Government. If the Government should adopt a free-trade policy absolutely, we will try and survive; we will still be in favor of the policy of the Government. The responsibility for the policy of the Government is upon the American Congress and not upon us. But so long as protection is the policy, we contend for our place under that policy—and we accept that as the fixed policy of the present administration.

I have said about all, I think, Mr. Chairman, that it is necessary for me to say, because, as the schedule of hearings indicate, the proponents of the different farm commodities will expect to be heard at considerable length, and if I may I will not enter into the discussion of any of those special items in the farm schedule. I understand that sheep and wool and mutton products are to be taken up next. I think I will close, Mr. Chairman.

Senator JONES. They will undertake to show us as to how a tariff would affect the different farm commodities and products, whether the tariff would benefit one class or not or another class or not.

Prof. ATKESON. Well, if a tariff performs any of its purposes, it always benefits one class to the more or less disadvantage of some other class. That is fundamental.

Senator JONES. What I meant was, these other people who are to be heard here will undertake to show how the tariff will affect the specific product which they represent.

Prof. ATKESON. Undoubtedly. It seems unnecessary for me to go into that now. I would not hesitate to discuss the wool question; but since there are gentlemen here who are going to discuss that question specifically, I just wanted to lay down a few principles that seem to me basic and underlying the question of agricultural protection, and the one that I would rather that you would not get away from than any other is the fact that when the farmer disposes of his product that it is a finished product, as far as he is concerned.

BRIEF OF GRAY SILVER, REPRESENTING THE AMERICAN FARM BUREAU FEDERATION.

This organization, with a membership of more than 1,000,000 farmers located in 46 States, necessarily views the tariff from the broad national standpoint. Various representatives of the federation have appeared to discuss the schedules in detail when they were under consideration by the Finance Committee. Our specialists have made studies of the need and effect of tariff on farm products in view of the peculiar and unprecedented situation in world trade at this time.

Since the expressed policy of the Nation is for a protective tariff, the problem before Congress is to so adjust the duties as to afford the most thorough protection to the industries that should be fostered for the national welfare, while at the same time not adversely affecting foreign trade, or international economic relations.

The farmers' interest in tariff question in the past has been twofold.

(1) As a producer he desires protection in fair relation to the protection given to manufacturing industries from the competition of foreign products produced under conditions of natural advantage or very cheap labor.

(2) As a consumer he is opposed to excessively high tariffs which would unduly increase the price of the supplies which enter into the cost of his product, and rates which unduly increase the cost of manufactured products which farmers use as a part of the general consuming public.

At this time farmers have a third interest in the tariff and its effects, namely:

(3) As an exporter of over half of the Nation's excess balance of exports in foreign trade, he is interested in the effect of the tariff on foreign demands for his products and in maintaining the balance of exports over imports.

PROTECTION FOR FARM PRODUCERS.

Certain American farm products meet competition in the markets from the same or similar products produced at much lower cost in foreign countries. To allow these cheap products to flow into our markets unchecked would immediately result in so depressing our own industry in these lines as to reflect seriously on other lines of production that are of vital importance. Public welfare is best served by preserving a balanced agricultural production which will afford a reasonable profit and maintain a prosperous agricultural commodity. Rates of duty should only be high enough to prevent the depression of our markets by the importation of large quantities of foreign goods. Prohibitory tariffs are seldom desirable and often injurious to trade in general.

Since protection against foreign competition is a national policy, it is essential that agriculture be considered in its proper relation to the protection of the entire country. The production of our farms must be considered the finished product of this industry in the same manner that machinery, shoes, clothing, etc., are considered finished products of other industry.

Experience with previous tariffs has given some indication of the rates of duty to be assessed to afford a certain protection to a farm product. The testimony of groups of producers of various commodities before committees of Congress shows the amount of protection that is regarded by them as necessary to maintain a given industry in competition with foreign goods.

Certain products may be produced in quantities sufficient to meet practically all needs of the country, provided the difference in cost in this and other countries is covered by a duty. While we have the soil and climate to produce wool and sugar equal to our entire needs, without a duty we can produce but a small part of our annual consumption because of the lower cost abroad. The point to be decided from a national standpoint is, What amount of our production of each commodity shall and can be assured by a protective tariff? The public interest demands that a balance be made between the advantages of complete domestic production and lower cost of imported products. Excessive tariffs which would increase all prices would not be to the advantage of the Nation nor to the producers ultimately.

TARIFF ON PRODUCTS THE FARMER BUYS.

The greatest single group of consumers in the Nation are our agricultural people who are interested in getting the goods they consume at the lowest cost consistent with prosperous conditions in industry, which in turn assures a normal consumption of farm products. The American farmer has the highest standard of living of any agricultural producer in the world and consumes more manufactured goods per capita than the people of any other country. He normally offers the greatest market for American manufactured products and also the greatest attraction for the foreign manufacturer. The proposed protection of his industry will be of little advantage to him if the cost of the things he buys are relatively higher and if his buying power is not increased. The price the farmer receives for his product is, in the last analysis, the amount of articles for consumption for which he can exchange his crop. Consequently, the tariff on the products which he sells must bear a fair relation to the duty on the supplies which he buys. A high duty on supplies which are imported, such as fertilizers, jute bags, etc., increases farmers' cost and tends to restrict production.

Any scale of rates of duty on farm products must be judged by two conditions: First, it is sufficient to cover the labor cost differential between American and foreign production; and, second, does it bear the proper relation to the rate on manufactured products which this same producer must buy?

TARIFF AND FOREIGN MARKETS.

The American farmer produces a surplus of several products which must be marketed abroad, and is vitally concerned in the effect the tariff may have upon the outlet for his export surplus. The Nation as a whole has had a favorable foreign trade balance almost continuously for 100 years; only 3 years since 1897 have the imports exceeded exports in value, and that was in relatively small amounts. On the contrary, the excess of exports has grown since the depression of 1893, averaging near to one-half billion dollars until the beginning of the World War, when values began to rise and the excess of exports amounted to over $4,000,000,000 in the calendar year 1919.

Agriculture has provided the largest part of this excess of exports from our earliest history. From 1852 to 1881 agricultural products made about 80 per cent of the total of domestic exports. During the next 30 years there was a decline until in 1911 when agricultural products provided about 54 per cent of all exports. This decline was checked by the opening of the World War and the volume of exports increased steadily until 1920. The increase in values was even more rapid, due to the advancing prices. The beginning of the decline in value was shown in 1919 while the difference in tonnage was relatively small.

There has been a tendency in recent years for agricultural exports to be offset by relatively larger proportion of agricultural imports, thus imposing on agriculture a heavier share of foreign competition.

ADJUSTING THE TARIFF TO CHANGING CONDITIONS.

At the present time the economic relations of nations are subject to changes that can not be anticipated. This makes it especially difficult to fix rates of duty which will meet all emergencies.

A means of tariff adjustment which will operate quickly is needed. The extension of the powers of the President or the Tariff Commission to meet any emergency, operating within limits fixed by Congress, would aid greatly in increasing the protective services of the tariff.

By constant study and investigation this body should be able to quickly adjust tariff rates to changing conditions in international trade without the delay of referring the entire matter to Congress.

THE BASIS OF VALUATION.

In the present tariff bill there appears the new American valuation plan. The adoption of this system would involve radical changes in the system of collecting customs duties and require the entire reorganization of the revenue service.

The first effect of this system of valuation would be to increase the amount of duty to be paid, since the Fordney bill provides that the duty be calculated upon the wholesale market price which includes distribution costs in addition to production costs. When goods are imported that have not been sold here, an American price must be named by the customs officials which in effect obligates them to perform a price-fixing duty.

In view of the discussion of the effect of this American valuation, present rates as determined for farm products must be regarded as tentative until the rates on supplies which the farmer purchases have been revised. A proper balance must be maintained. Since most agricultural duties are on a specific basis and most other duties are on the ad valorem basis, the American valuation would disturb the relations of these rates seriously if it should have the effect of increasing duties as is generally stated. The rate of duty should be sufficient to cover the advantages in lower labor cost and a part of natural advantages of foreign producers, but not the difference due to business inefficiency.

The importation of foreign goods would be disturbed because of the uncertainty as to the amount of the duty if it should be based upon a fluctuating wholesale price.

GENERAL TARIFF RELATIONS.

1. The farmers of the country are generally in favor of tariffs that will protect American producers against the competition of extremely cheap goods produced in

other countries where labor is maintained under very low standards of living. They believe in a fair relation of tariffs between farm products and manufactured products.

(2) The agricultural products upon which a protective tariff is effective are relatively few. The recent experience with the emergency tariff indicates that the restrictive effect on trade of agricultural products is slight except in a few instances. Moderate tariffs will not seriously change the rate of trade, but excessive tariffs would probably do so to the ultimate disadvantage of the country.

(3) Farmers interest in protection is not confined alone to his industry but extends to American manufacturers. American industries and business provide the greatest market for American farm products. Normal employment is necessary to maintain normal agricultural consumption. Maximum income on farms means maximum consumption of manufactured goods. Consequently the protection of agriculture is also protection for our other industries since it conserves their home market through sustained buying power of farmers.

No tariff can protect the American farmer from the competition of the cheaper products which his surplus meets in the foreign market, therefore the home market must be carefully safeguarded.

(4) There must be reasonable limits to such protection, however, in order not to foster profiteering and to preserve the force of competition of the foreign products. Protection for manufacturers must bear a fair relation to protection for agriculture.

(5) The nature of foreign trade will determine the status of agriculture. Two outstanding examples of this are Great Britain and Germany. For 50 years previous to the recent war Great Britain allowed her agriculture to suffer without affording it protection. While her tariffs were not at first designed to be protective tariffs such have been adopted since the war under the title of safeguarding of industries. Protection of British industries was afforded through cheap ocean freight rates.

In Germany the policy of the Government to foster agriculture through effective protection developed a much stronger agriculture, though the purpose was to gain military power. The advantage of such a policy was clearly shown in the war when without the aid of other nations, Great Britain alone would probably have been defeated because of the shortage of food without aid from the United States while Germany was not starved. A prosperous agriculture is the basis of national prosperity.

(6) To preserve foreign trade there must be a large balance of imports to offset exports. In the past agriculture has borne an equal share of imports as compared with exports. This ratio should not be seriously changed. Tariffs that are prohibitory on imported products that make up the large part of our trade must therefore be objected to by farmers. A reasonable rate of duty that will not seriously disturb the balance of imports is more desirable than an excessive rate which would act as a tariff barrier.

(7) The constant production of a surplus of foodstuffs is the consumer's best insurance against a scarcity and the resulting high price. Without an outlet the American farmer would be penalized when he produced a surplus by the low prices due to a restricted market. He would have no incentive to expand production and output would decline; the farmer as a consumer of manufactured goods would be weakened and all business would feel the effects just as it has this year when farm depression has been reflected throughout the business structure. If a shortage resulted and high prices came the consumer would be forced to pay more. Manufacturers would be forced to seek a market for their goods abroad in competition with those of other manufacturing nations.

Moderate rates or protection on agricultural products with a moderate rate on corresponding manufactured product is to the best interests of both producer and consumer.

Farmers are asking only for a rate that will afford them an even opportunity with foreign producers to maintain the industries in their present development, with opportunities to grow as a means of cheaper production are devised by better practices and scientific improvements.

It is not desirable from the national standpoint to have rates of protection of manufactured products which will enable them to be sold constantly at far above the level of prices of similar products in other countries. Such an artificial trade barrier is not only unjust but dangerous and doomed to collapse sooner or later with disastrous effects upon business as a whole, though a few individuals might temporarily make large profits.

Valuation for importation should reflect the cost of production and the duty represent the difference in labor cost. Tariffs above that become embargo. Such valuation can only be secured in the country where the imports originate.

Trade is a matter of fair exchange and relations with the United States to other nations are now such that a large volume of trade must be maintained. A healthy foreign trade in agricultural products is the best stimulant to American agricultural production.

STATEMENT OF JOHN H. KIRBY, PRESIDENT SOUTHERN TARIFF ASSOCIATION, HOUSTON, TEX.

Senator GOODING. I want to say, Mr. Chairman, that a little more than a year ago an organization was formed in the State of Texas, known as the Southern Tariff Association. Since that time every Southern State has become a member of that association—in fact, several Eastern and Western States—so that to-day they have a membership of 41 States. This association represents 62 different industries, and linked with it is membership of 247 State and local organizations. The president of that association is here this morning, Mr. Chairman, and I would like to ask him to tell the committee why this organization was formed, its purposes and aims. I have the pleasure of introducing Mr. John H. Kirby, of Texas, president of the Southern Tariff Association.

Senator MCCUMBER. Mr. Kirby, we shall be very glad to hear from you.

Mr. KIRBY. Thank you, Senator. We of the South thoroughly appreciate the courtesy of this committee in giving us this chance to present some of our problems, which, of course, we must do in a very brief way.

Following the suggestion made by Senator Gooding, I will state that the Southern Tariff Association grew out of the distress, largely, of the agricultural elements of the South, under the application of the new doctrine which has come to be known as the doctrine of free raw materials.

Personally, I am not a producer of any product—my leading business being the manufacture of lumber—that solicits or desires or would be affected by any form of tariff legislation with respect to that particular commodity. But I am interested in the public welfare and in the thrift of my customers and in the progress and prosperity of my country. Therefore, upon the urgent request of the farmers and stock raisers of Texas, I took upon myself the work and the duty of acting as president of this association at its inception.

The association was first composed of farmers and stock raisers in Texas. Then it grew and other southern States became attracted to us, until it has reached the magnitude outlined to you by Senator Gooding.

Distress brought it into being. The cotton farmer of Texas in 1920 found that his cotton seed had undergone frightful shrinkage in value—that was true not alone of Texas but all of the South—the shrinkage amounting to something like $300,000,000. We knew that a part of this was in consequence of the deflation program of the Government through the Federal Reserve Board, but we were convinced that the greater part of it resulted from the importation duty free of vegetable oils from the Orient and from the Tropics.

The peanut farmer in the South, whose crop in 1919 had sold for practically $100,000,000, could not in 1920 sell for $10,000,000, largely from the same cause.

The egg and poultry growers of the South, who had enjoyed some prosperity prior to 1920, found themselves unable to keep their hens, largely from the importation free of duty of eggs from China.

The woolgrowers of Texas found their spring clip and their fall clip still in the warehouses at San Antonio, San Angelo, Del Rio,

and El Paso, and other concentration points, without a bidder for that commodity, all through the free importation into this country of foreign wools, largely from Australia and Argentina.

The cattle raisers of Texas (and every farmer in Texas is a cattle raiser; not big herds, though some men have large herds) found that their meats had shrunk until there was no demand for their steers, all through the free importation of meats from Argentina. We can not compete anywhere in this country on our ranges with the ranges of Argentina; we can not fatten our steers anywhere in this country with the expensive feed that we must provide for them in competition with the steer growers of Argentina.

There they plant clover, and inclose it, and then at feeding time, instead of employing men and buying expensive feed, they turn their steers into these clover fields, so that a steer in Argentina 3½ years old will weigh 200 pounds more than a steer of the same age anywhere in the United States. They can kill and dress those steers in Argentina for less money than we can here, because they have a lower wage scale; they can load them in the refrigerator ships in the ports of Argentina and ship those carcasses to the principal markets of this country for less freight than we must pay from Fort Worth, Tex., to those principal markets.

Under these circumstances of free importation of meats the cattle industry is being ruined.

The free importation of hides was taking the hide industry away from us. So that it really did not pay to skin an animal, unless you skinned him for other purposes than the recovery of his hide.

The free importation of mutton from Australia and New Zealand into the markets of this country in refrigerator ships destroyed the demand for American sheep.

So all down the line, the agriculturist of the South found everything that he produced practically on the free list, while he was compelled to buy his supplies in a taxed market.

Under those circumstances the Southern Tariff Association was organized to protest against the doctrine of free raw material and to contend that in all tariff levies, whether for revenue or for protective purposes, there should be no discrimination against any industry or any section of the country. That is the way we started.

We have been charged with being a Republican side show. Permit me to say that 95 per cent of our members are Democrats. I do not want to introduce any controversial question, but I just want to put our position squarely before you. We come to you pleading for justice, not for favor, and to ask you that in the levies that you make you will give the agriculturists of our section of the country and all the products of our section of the country the same character of treatment that you accord other sections of the country, without discrimination toward them or toward us.

Senator McCumber. Let me say, Mr. Kirby, that the view of this side of the chamber has always been that the tariff is not a local but national question; and we want to do entire justice. Sometimes, however, it is a little difficult when we always find the votes from your section against us in the matter of expanding our policy of protection over the whole country.

Mr. Kirby. We have been taught, Mr. Chairman, that protection was a wicked device of the Republican Party, created for the pur

pose of imposing unjust burdens upon the South. That has been the political contention heretofore, but we have been making some investigations upon our own account. We find that instead of this device having been invented by the Republican Party for wicked and despoiling purposes, that it originated with the Constitution itself; that the very first general act passed by the First Congress of the United States was a protective act, and one that recited in its preamble its purposes—to raise revenue to defray the expenses of the Government, and to encourage and protect manufactures against foreign goods, wares, and merchandise.

There were notorious impostors in that Congress, according to our modern philosophy in the South, because they gave assent to that preamble and bill; and among those impostors were men whose names appeared signed to the Declaration of Independence, men who had assisted in formulating the Constitution of the confederation under which we fought the Revolutionary War, men who sat in the convention that framed the present Constitution—James Madison was there, Richard Henry Lee, Charles Carroll of Carrollton, Elbridge Gerry, Abraham Baldwin, and many others who represented the brains and patriotism and purpose of the Republic at that time. And the act was vitalized by the signature of a man who was "First in war, first in peace, and first in the hearts of his countrymen."

Modern men there may be who say that the first act of the legislative body would perhaps be a per diem and mileage bill. That was not what those old patriots thought. The first thing was to protect American industry and give us a position in the world; that is what they thought, and that is what they have handed down to us and for which we steadfastly contended even up to the times of "Hickory Jackson"——

Senator McCumber (interposing). I wish to make clear that while we recognize your sympathy with our views, your vote is always against us; and we would like you to impress your influence upon the vote that will help us crystallize into law what their sentiments are where they agree with you.

Mr. Kirby. We are trying to tell you, Senator McCumber, why we are not following our southern politicians. The business men of the South, the producers of the South, the bankers of the South—in fact, the whole South has awakened on this question.

Senator McLean. All but the voters.

Mr. Kirby. They have awakened also. Did you notice what you got in the South the last time?

Senator McLean. We did not get enough.

Mr. Kirby. You did in some States. You carried some States, to your amazement.

Senator Watson. I think you ought to be congratulated upon the promise and the hope that you hold out. [Applause.]

Mr. Kirby. I thank you; that is the encouragement we need.

We have come to look upon this as a purely economic question and not really one that ought to be the football of partisan politics.

There are a great many men affiliated with us who earnestly believe in a protective tariff, who have been investigating this economic question, and who believe—who know from history—that there has

never been any prosperity in this country under a low tariff, when national and international conditions were normal.

Of course, my Democratic friends contend that under the Walker tariff of 1846 we had marvelous prosperity for a period of almost 10 years. But they have not stopped to consider world conditions and what brought about that prosperity. We prospered then, as I now know, but did not used to know, in spite of the Walker tariff. It was not a free-trade tariff, and it was not a discriminating tariff, but it was a low tariff. We prospered in spite of the Walker tariff, because immediately following its enactment we went into war with Mexico. By the time peace was restored we discovered gold in California. About that time the third Napoleon ascended the throne of France through revolution and all Europe went to arms; and in 1854 France and Great Britain put in with Turkey to whip Russia, and Russia was under blockade for a couple of years.

Then we had in that same period the Irish famine and short crops and distress throughout Europe, all of which made great drafts upon our farms, fields, and factories. So that we prospered in that time in spite of that Walker tariff.

But just as soon as peace came to Europe and the men who had been engaged in military lines went back to the arts of peace and useful, productive employment we had the panic of 1857. We have had panic and distress following every low tariff that has ever been put on the statute books in this country.

That is what we know down South, and that is the doctrine we are preaching, and that is the doctrine we stand for. But we are not standing for it in order to curry favor with the Republican Party and we are not standing for it as partisans. We are standing for it as business men, as Americans who want to build up the country to assist in continuing here the greatest country in the world. A country that has only 6 per cent of the area of the world and only 6 per cent of the population of the world and yet owns one-third of the property of the world and more than 40 per cent of the gold of the world and more than 40 per cent of the railroad mileage of the world is worth preserving.

I was old enough to know something of the conditions that fell upon the South after the Civil War. If you look at me you will see I am still a youth, but I was there at the time. [Laughter.]

The condition of the South at that time is duplicated to-day in Europe. I was a babe when the war broke out, and my father at that time was sheriff of our county, a man of property, who also owned slaves. But when I grew up—a few years after the war, say, within 10 years after the war—I plowed a yoke of oxen, because that father of mine was not able to buy another horse. My mother and my sisters spun and wove the cloth out of which the family clothing was made. My father made the family shoes from leather obtained from rude tanyards in the neighborhood. We worked long hours for little pay. Why? Because we were broke. Our Government was broke, our State government was broke, our county government was broke, and our municipal governments were broke. All our industries were broke and all our people were broke.

That same condition exists in Europe to-day. They will make the cheapest merchandise, the cheapest goods that ever came into the markets of the world. If you do not accord to American toil some

protection against those cheap-made goods our American toilers will go to the level of the pauperized peoples of Europe and Asia to-day.

There are 20,000,000 people directly and indirectly engaged in manufacturing enterprises in this country. More than 50 per cent of them will be tramps if you do not continue this American policy, instituted by our forefathers in the first general act of the first Congress that sat under this Constitution; if you do not continue that general policy in the present economic condition of the world you are going to bring distress not only to every toiler, but you are going to bring tears and heartaches to every man and woman in America.

In that policy we agree with you, and we want to be represented in it with justice and without discrimination.

Now, I want to introduce these resolutions passed by a congress of this association held in Greensboro, N. C., on August 16 last [reading]:

> First. That the tariff policy of the Sixty-seventh Congress was definitely settled at the November election.
>
> Second. That we recommend such tariff schedules on southern products as will equalize the cost of production in this country with that of foreign countries, so far as may be consistent with the public welfare, such schedules to be so placed as to fairly distribute the burden and benefits among all industries without discriminating against any section, class, or product, to the end that there may be maintained American standards of living in every line of effort.
>
> Third. That we are opposed to the doctrine of free raw materials on agricultural, pastoral, and mineral products.
>
> Fourth. That we appeal to all Congressmen to give consideration to the economic welfare of the South by favoring the same tariff policy for southern products that is applied to the products of other sections.

That resolution not only met with unanimous report of the congress held in Greensboro on the 16th day of September, but bears the signature of 414 banks in the State of North Carolina, being 70 per cent of all the banks in the State, and from which State all of the banks have not been heard from, but the relation of the banks in North Carolina to this resolution stood 414 to 11 against. In Mississippi there were 243 for to 5 against, or 81 per cent of all the banks in Mississippi signed this resolution; 269 banks, constituting [?] per cent of all the banks in the State of South Carolina; 257 banks, constituting 50 per cent of all banks in Virginia; and 239 banks, constituting 80 per cent of the banks in the State of Louisiana, signed this resolution, together with other banks from other Southern States, aggregating 2,254 banks voting in the affirmative and 32 banks declining to sign.

Senator WATSON. When you say that a bank signed, what do you mean?

Mr. KIRBY. The responsible officers of the bank, president or cashier, which bears the signature of the bank, and those signatures are here on file with your committee. I am just summarizing for your information.

Senator WATSON. I was wondering whether one person of a certain bank signed, or was some action taken by the board of directors; did the president and vice president sign it?

Mr. KIRBY. We think in most instances the board of directors acted, because we had in some instances statements from the officers of the bank that there was opposition, and notwithstanding the fact

that the board of directors were in the majority for it, they would have to vote in the negative because it was their policy not to carry anything except by unanimous vote.

Senator Watson. Where they signed, was it unanimous?

Mr. Kirby. Yes, sir. In addition to that, certain agricultural commissioners of certain Southern States signed, including W. A. Graham, commissioner of agriculture in the State of North Carolina; B. Harris, commissioner of agriculture of the State of South Carolina; G .W. Koiner, of the State of Virginia; and Dr. F. A. Woods, of the State of Maryland. No commissioner of agriculture, so far as we are informed, has declined to sign, but these were merely signatures sent in by those interested in our work in the various localities.

Senator Simmons. Will you let me have a copy of this resolution?

Mr. Kirby. We intend to file it. I think it is on file already, but you are welcome to that copy [handing copy of resolutions to Senator Simmons].

Senator Simmons. Is this what you call the signatures down here [indicating]?

Mr. Kirby. Yes.

Senator Simmons. You mean these printed signatures?

Mr. Kirby. The original, with written signatures, is on file with your committee here. That was typewritten for convenience.

Senator Simmons. Mr. Kirby, how did you procure the signatures of these banks? Did you have somebody to go around to each bank?

Mr. Kirby. I did not handle it myself, Senator, but I do not understand that that has been the method. E. P. Wharton, of Greensboro, whom you doubtless know, and who is a friend of yours——

Senator Simmons (interposing). Yes.

Senator McCumber. If you will permit me, I will explain it.

Senator Simmons. I would just as soon Mr. Kirby should explain it; he is the president of the Tariff Association.

Mr. Kirby. Mr. Wharton was created chairman of the North Carolina division of this association, and the circular to the banks and the resolution were sent to the banks through Mr. Wharton, or under his direction—I do not know just the method. But the signatures came back and were filed with us at the central headquarters.

Senator Simmons. You do not know what sort of a presentation was made to the bank or whether any was made or not?

Mr. Kirby. I do not know what kind of a letter accompanied the resolution.

Senator Simmons. Your impression is that it was just sent to them and sent back?

Mr. Kirby. My impression is that the resolution was sent to them in printed form, together with the request to give it consideration and that they approved it, signed it, and returned it.

Senator Simmons. And you say that the commissioner of agriculture of North Carolina signed that?

Mr. Kirby. Yes, sir.

Senator Simmons. And the State commissioners of agriculture—

Mr. Kirby (interposing). South Carolina, Virginia, Maryland, and Louisiana are the only signatures we have here. We know that the commissioner of agriculture in Texas is sympathetic, but I do not know whether he added his signature or not.

ITALIAN PRODUCTS.

'TATEMENT OF L. J. SCARAMELLI, REPRESENTING ITALIAN CHAMBER OF COMMERCE, NEW YORK,

Mr. SCARAMELLI. Mr. Chairman and gentlemen of the Senate 'inance Committee——

The CHAIRMAN (interposing). You reside in New York?

Mr. SCARAMELLI. I do.

The CHAIRMAN. What is your occupation and business?

Mr. SCARAMELLI. I am a merchant. I come before you as the resident of the Italian Chamber of Commerce of New York.

The CHAIRMAN. Proceed.

Senator CALDER. That chamber of commerce is an organization of merican business men dealing with Italian products?

Mr. SCARAMELLI. I was going to explain that, Senator. The alian Chamber of Commerce is an American association of business ien. It was incorporated and organized in 1886 under the laws of ie State of New York and, with the exception of a few associate embers with no voting power residing in Italy, the balance of them—arly a thousand—are American business men.

Senator MCCUMBER. Why the particular name—the Italian Cham- r of Commerce?

Mr. SCARAMELLI. It was organized in 1886, and the name has mained the same ever since.

Senator WATSON. Are all the members Italians?

Mr. SCARAMELLI. Oh, no; we have practically all the largest Ameri- n bankers in New York City. Our chamber is composed of import- s and exporters, representing Italian manufacturers and American anufacturers.

Senator WATSON. You merchandise to and from Italy exclusively?

Mr. SCARAMELLI. Our chamber is for the purpose of increasing and omoting business between the United States and Italy.

Senator MCCUMBER. That is the reason you use the Italian name?

Mr. SCARAMELLI. That is the reason.

The opinion and facts which I am about to give you represent the neral view of our members interested in tariff matters. In order save time, if you will allow me, I will go right in and begin to speak a few articles, and I shall take, first, cheese.

The Payne-Aldrich bill had 6 cents a pound duty; the Underwood l changed it to 20 per cent ad valorem; the emergency tariff 23 r cent ad valorem.

The Fordney bill provides for 5 cents a pound up to the valuation 30 cents a pound and above that 25 per cent ad valorem. You n see that we are going from bad to worse. Just imagine, gentle- n, cheese worth 30 cents a pound will pay 5 cents and cheese rth 31 cents will pay 7½ cents a pound duty. I never could see y the Underwood bill changed from specific tariff to ad valorem; e reason, of course, was to reduce the tariff, and they did, because en times were normal 20 per cent meant 4 cents a pound, and that ant 2 cents lower than the Payne-Aldrich. Twenty-three per it ad valorem, as per the emergency tariff bill, means exactly 12

cents per pound. The only cheese that runs anywhere like th cheese——

Senator SMOOT (interposing). It means 12 cents a pound?

Mr. SCARAMELLI. It means 12 cents a pound on foreign chees coming into this country.

Gentlemen, if you will allow me to explain and then ask me al the questions you desire, we will proceed faster.

What I want to get at is this: The cheese that we manufactu in this country that might feel competition is the domestic Swis cheese. We all know that Wisconsin and other States are makin Swiss cheese in large quantities. To-day the imported Swiss chees costs to import 65 cents per pound, New York City, duty paid If you add 10 per cent, the usual wholesale profit, it makes a sellin price of 72 cents a pound. The domestic Swiss sells from 25 cent to 45 cents a pound, and the cheese selling at 45 cents a pound i near in quality to the imported. There you can see a differenc of 30 cents a pound in the selling price, and I ask you why we nee 12 cents per pound protection?

Senator WATSON. You say that the 45 cents domestic Swiss chee and the best grade that you import from Italy is comparable?

Mr. SCARAMELLI. About the same as to quality.

Senator WATSON. At what do you lay down the Italian importe Swiss cheese in the United States—what does it cost?

Mr. SCARAMELLI. Sixty-five cents.

Senator WATSON. Where does it come from?

Mr. SCARAMELLI. This Swiss cheese generally comes from Switz land.

Senator MCCUMBER. How are you able to sell in competition wi 45-cent cheese?

Mr. SCARAMELLI. We are not selling it. There is only a sm quantity coming in now.

Senator MCCUMBER. Is it made from the same kind of milk?

Mr. SCARAMELLI. It is made from the same kind of milk and abo the same percentage of butter fat.

Senator MCCUMBER. Is it made from cow's milk?

Mr. SCARAMELLI. It is made from cow's milk.

Senator MCCUMBER. And not from goat's milk?

Mr. SCARAMELLI. No; Swiss cheese is made from cow's milk.

Senator SUTHERLAND. They must make a very much larger pr than they do upon our cheese. It certainly does not cost more th American cheese—American Swiss cheese—does.

Mr. SCARAMELLI. I would say to you that it costs a great deal m money than to manufacture domestic Swiss cheese. Switzerland a gold basis prewar exchange.

Senator WATSON. Why do they not buy the American product 45 cents when they have to pay 65 cents for the other?

Mr. SCARAMELLI. They have to pay 75 cents for the imported.

Senator WATSON. What do we want? Why not buy the Am ican?

Mr. SCARAMELLI. We do; but is it fair for cheese coming here fo century to be prohibited from importation just so long as it does create competition with the American?

Senator WATSON. It would be prohibited anyway, would it not

Mr. SCARAMELLI. Why?

Senator WATSON. But you have to pay 65 cents a pound for one nd 45 cents a pound for the other; that of itself would prohibit, ould it not?

Senator McCUMBER (interposing). Even though you deduct 12 ents a pound.

Senator WATSON. If you did not have any tariff, absolute free rade, are people going to pay 65 cents for foreign cheese when they an get almost as good cheese at 45 cents a pound produced in the nited States?

Mr. SCARAMELLI. The fact remains that there is a demand for the nported cheese. A certain clientele has been getting it for years nd years, and it is unjust, it seems to me, to prevent our people from etting it if they want it.

Senator WATSON. Is the American cheese just as good, so they an not tell them apart?

Mr. SCARAMELLI. I tell you some of it is just as good as the imported n my opinion, but others do not think the same because they demand he imported.

Senator WATSON. Can you tell one from the other if it were put n a plate, by sight or taste?

Mr. SCARAMELLI. By sight and also by taste you can tell the ifference.

The cheeses coming from Italy—none are manufactured in this ountry to any extent. During the war, I, for one, started to make ome Italian-type cheese here, but we could not succeed. In the rst place, some of them, such as Roman cheese, is made of sheep's ilk.

Senator WATSON. Is not imported Swiss cheese made of goat's ilk?

Mr. SCARAMELLI. No; it is made of cow's milk. I am talking about oman cheese now.

The CHAIRMAN. Milk in the dairies over there does not have the areful governmental inspection that it has here?

Mr. SCARAMELLI. Yes, they are subjected to inspection.

Senator SIMMONS. Do the cows over there give the same kind of ilk they do over here?

Mr. SCARAMELLI. I suppose they do.

Senator SIMMONS. They do, if they are the same kind of cows.

Mr. SCARAMELLI. Gentlemen, if you will let me go along with the gument, we will proceed faster.

The Roman cheese, as I stated, which is made out of sheep's milk— uring the war we put the proposition up to the farmers in this ountry to see whether it was worth while to milk sheep and make at cheese, but we found it would require a great many years to erfect the industry, and in addition to that the individual business ould not have been big enough to make it worth while. Some one ied to make an imitation with cow's milk, but they did not succeed. So we have the genuine article imported from Italy to this country, hich is used by those men who are laying your railroad tracks, and e are charging them 23 per cent ad valorem. We claim that just long as such chesse is not manufactured in this country, just so ng as it is used by the poor laboring classes—because cheese, we

all agree, is the next thing to meat, and should be cheaper than meat (and it is not at the present time)—12 cents a pound duty is entirely too high. We recommend that you should go back to a specific duty. If you do nothing else for us, gentlemen, have the Fordney bill go back to a specific duty, make it 5 cents a pound, and if you can not give us 5 cents a pound straight, let us go back to 6 cents, the same as the Payne-Aldrich, but please let us have a specific duty.

Senator McCUMBER. This is made out of sheep's milk, you say?

Mr. SCARAMELLI. Yes.

Senator McCUMBER. What does it sell for in this country?

Mr. SCARAMELLI. It costs 63 cents a pound to import.

Senator McCUMBER. Is that any better than the 45 cents per pound cheese?

Mr. SCARAMELLI. It is not comparable, sir. This is what is known as Roman cheese, made out of sheep's milk. It has a different quality, and there is no comparison whatsoever.

Senator WATSON. And you say that laboring people laying rail road track buy that cheese?

Mr. SCARAMELLI. Yes, sir. They used to at one time buy it by the pound, and now they buy one-half of a pound only. They hav been accustomed to use it from their youth, accustomed to that par ticular taste of cheese, and it will be a hardship for them to be de prived of it. So, if you can not do anything else, go back to a specif rate, make it 6 cents, if you desire, but forget the present rate, whic is unfair to our working man.

In addition to that, I want to explain another matter concernin specific duty: For the last eight years we have experienced all kin of trouble in establishing the real market value before the apprais in New York City, due to the fact that all this cheese is cured fro one to two and three years before it is marketed, and the curin process makes practically every loaf of different quality; and I. I wanted to be a sharp importer, could enter my cheese at 5 ce lower than any of my competitors, and the examiner would absolutely helpless to determine as to whether I was wrong or rig due to the variation in quality.

We had a case the other day at the appraiser's store. The Go ernment advanced some invoices, if I am correctly informed, ju because an agent of this Government in Italy cabled market valu of that particular kind of cheese, which was Roman cheese. W tried the case before the appraiser, and won out, in spite of the fa that you had your own agents cabling the market values. Th goes to give you an idea of how the examiner is all up in the air. T examiner, perhaps one of the poorest paid of Government employe can not expect to be an expert and capable of passing on the val of this class of cheese.

Senator WATSON. Where is Roman cheese made?

Mr. SCARAMELLI. Roman cheese is made in Italy.

Senator WATSON. How much of it is brought in in a year?

Mr. SCARAMELLI. Not very much now, because the production not so very big at the present time.

Senator WATSON. It is not even mentioned in the report.

Senator SMOOT. You say the laboring man buys that cheese a pays a dollar a pound for it?

Mr. SCARAMELLI. He does; though instead of buying 1 pound as ıe used to he now buys one-fourth of a pound, but he wants that kind f cheese; and any time, if you have any Italians in your neighborıood, you see them and inquire about Roman cheese they will tell ou right away whether they want the Roman cheese or not.

It is not fair, gentlemen, that you should insist upon a duty of 25 per cent, which is equal to prohibition.

Senator McCUMBER. What effect does the longer curing have upon he cheese?

Mr. SCARAMELLI. The older it gets the better quality, and some heese is cured as long as four years.

Senator McCUMBER. It gets riper?

Mr. SCARAMELLI. It cures, I should call it. It has a sharp taste, which, for food purposes, is preferable, and none of it is made here.

Senator McCUMBER. It does not have the fragrance of the limerger? [Laughter.]

Mr. SCARAMELLI. Limberger is a different kind of cheese entirely. None of that comes from Italy. Limberger used to come from Gernany.

Senator WATSON. The import of all kinds of cheese is 15,992,000 ounds, 5,000,000 of that was Roman; that leaves 10,000,000 of all ther cheeses.

Mr. SCARAMELLI. I guess it is right. The largest importation of heese in this country now comes from Italy. The next one, I beeve, is Switzerland.

Senator McCUMBER. You do not think that kind of cheese that ou are now speaking of is really competitive with any of the other rands, do you?

Mr. SCARAMELLI. There is none made in this country that finds ompetition with any of the imported.

Senator McCUMBER. I would not think so, if they were willing to ay $1 a pound for it.

Mr. SCARAMELLI. I do not exactly say a dollar a pound. But I mply say to you that it is not made here and there is a big demand r that cheese by the laboring classes.

As I stated, we ask the specific rate of duty be put back.

Senator SIMMONS. You say the laboring man buys and consumes hat $1 a pound cheese?

Mr. SCARAMELLI. Yes, sir; they are doing it now.

Senator SIMMONS. And this duty you speak of does not protect ny American industry?

Mr. SCARAMELLI. It does not, which adds too much to the cost of ving of the laboring classes.

Senator WATSON. Is there any of that kind of cheese produced in his country?

Mr. SCARAMELLI. Absolutely none.

I want to say something about the contracts and call your attenon to the fact that at the present ad valorem duty we can not conract for any cheeses abroad, because with an excitable market three onths from to-day the value may be higher or lower and therefore e can not recontract here in advance without taking a gambling hance.

If you can not see your way clear to make it 5 cents a pound make it 6 cents; but let us go back to a specific duty, because, after all, the valuation of all kinds of imported cheeses does not average more than 10 per cent difference.

I want to say a few words about lemons. The Payne-Aldrich bill had 2 cents per pound on lemons; the Underwood bill lowered it to one-half cent per pound. Now, the emergency tariff bill is 2 cents, and the Fordney bill 2 cents a pound.

There is very little to say about this article except the statistics show that California is supplying to-day 5,000,000 boxes of lemons against 1,000,000 boxes imported from Italy. I am a Republican and have been since I became an American citizen, and expect to be for the balance of my life; and if you can show me that California in increasing this industry to such a large production still needs 10 cents per pound protection in order to get a fair profit out of it let us give it to her—but I do know she is now making a handsome profit—and is it fair, gentlemen, to compel the poor classes to pay so much for lemons, which have become one of the necessities of our table? You have taken wine and beer away from us, and it is up to you to see that we get cheaper lemonade. [Laughter.]

The same thing applies to walnuts from California. Their industry has grown tremendously. I am selling them myself in New York City and prefer selling California walnuts because I get 10 cents a pound higher than for any imported walnuts. Just imagine, 10 cents a pound more, and I can not get enough from California; and yet the Fordney bill wants an increase from 2 to 5 cents a pound.

Senator McCUMBER. You say the California walnut demands a higher price?

Mr. SCARAMELLI. Sells at 10 cents a pound higher than any imported walnuts, and we can not get enough of them from California because they do not grow enough; the consumers prefer the California walnuts.

Senator WATSON. And if we sufficiently protect the industry they will soon be furnishing enough of them to meet your requirements.

Mr. SCARAMELLI. They do furnish them.

Senator WATSON. But I mean enough to supply your demand.

Mr. SCARAMELLI. The reason they sell them is because of the quality. They have been able to establish a demand for their goods and gradually will put the importers out of business. We are having less coming from Europe every year. If you think California is losing money, let us give them 10 cents a pound protection. I want to say to you that we from New York believe that the million people, at least, who live between New York and Chicago claim that California, in this tariff, is getting undue advantage, and we believe it is up to you to see that we get a square deal in the East.

Senator McLEAN. Do you handle the pecan nut?

Mr. SCARAMELLI. No; I do not handle pecans.

Another article that I want to say a few words about is olive oil. The Payne-Aldrich bill had 40 cents per gallon in bulk and 50 cents on 1-gallon cans. The Underwood reduced it to 20 and 30; the emergency tariff 40 and 50, the same as the Payne-Aldrich; and now the Fordney bill changed it from gallon to pound in cans, which means still another addition of 10 cents a gallon in bulk and 25 cents a gallon additional in cans.

Olive oil is, in my estimation, a necessity for everyone, and parcularly the poor classes, and is needed for medicinal purposes. alifornia only grows enough to hardly supply the drug stores. I ill give you the exact figures of the importation of olive oil, which 5,000,000 gallons a year, and California only supplies 350,000 allons.

We are perfectly willing to go back to the Payne-Aldrich bill, of 0 and 50 per gallon, but please stop there.

If you have never tried olive oil, tell your wife to fry fish in it, nd then you will know how good olive oil is. It should be substituted for a great many fats, and I want to tell you if that was one your stomach would feel a great deal better.

Others have been before your committee on olive oil and asked a lifference from bulk to canned, some asking 30 cents, some 15, and ome 20. We claim that 10 cents is sufficient, but if you can not ee your way clear we are perfectly willing to accept 35 cents a gallon in bulk and 50 cents a gallon in cans. Do not forget that a great part of the olive oil coming from Italy is packed with American inplate, and if you could see your way clear in this tariff to give a preferential rate to the countries which use American raw products t might be a good plan. In order to protect California, which does not make enough oil to supply its own State, you are going to have olive oil pay the highest tariff in history; if you think that is right, go to it. But I know you are going to reduce the tariff to what you think is just, and at least back to the Payne-Aldrich bill, when the conditions were normal; and you will make no mistake to use that basis.

We have another article from the Pacific coast, and that is cherries, which had formerly been free since the beginning of history of the cherry trade. They have been taken from the free list, now assessed at 3 cents per pound in the emergency tariff, and the Fordney bill puts it back to 1½ cents a pound.

Gentlemen, every year 75,000 barrels of cherries come from Italy, and only 3,000 barrels are grown in the State of Oregon. The cherries coming from Italy are small for dipping purposes and are used by the American manufacturers here. Are we going to put a duty on cherries, which are needed by the American manufacturers, and are we going to deprive our poor people in the summer time, and particularly the Jewish race, from getting a nice cherry drink from our fountains? It is only fair to state, I would be perfectly willing to accept 3 cents a pound if it can be shown cherries are competitive. It is a different quality of cherries. They do not grow here. The Italian cherries are small, while those grown on the Pacific coast are big cherries. The Fordney bill has given some consideration to my argument, as I spoke before the Ways and Means Committee.

Senator McCUMBER. This argument is made in favor of the higher duty of our growers of cherries in Oregon, namely, that the cherry in Italy being so very much smaller, there are a greater number of them to the quart and to the pound, and in use of a single cherry in the top of ice cream or similar purpose, that you get so many per quart that they can take the place entirely of the American cherry, which is a very much larger fruit and perhaps equal if not more luscious. They base their claim on account of the number of cherries, the very thing which you speak of.

Mr. SCARAMELLI. That is just exactly what I say, because they are small they are preferred and demanded by American manufac- turers; they can use them to better advantage for dipping purposes, and even if they could use the big ones there would not be enough to supply the industry of the United States.

Going to another article, and that is tomato paste and Italian tomatoes: The tomato paste in the Payne-Aldrich bill was 40 per cent ad valorem; under the Underwood bill it went back to 25 per cent and the Fordney bill has advanced it to 28 per cent. Perhaps one reason it was only increased 3 per cent is because I argued this article before the Ways and Means and probably had some weight.

I have a factory in Maryland which cost $75,000 and I make this paste. [Exhibiting sample to the committee.] This other sample is the imported. [Exhibiting another sample.] They are both the same size, 200 cans to a case, and about the same quality inside. I can manufacture for $8 a case. We contracted last summer at $1[illegible] a case. This [imported] cost $14 f. o. b. Naples, with $3.50 duty makes $17.50, and with 50 cents freight makes $18. I find I do not need any protection.

Senator McCUMBER. How can you sell that, or practically have to sell it, for $18 in competition with another which you can sell for $[illegible]

Mr. SCARAMELLI. We do not sell enough of it; that is the trouble. It used to be a bigger industry than it is, and it will come back if you don't pass a prohibitive tariff. I might say to you that the flavor of imported is better than the flavor of the domestic, due to the nature of the tomatoes. There is more food value in this shape of tomatoes than there is to the American, and it has a particular taste which is preferred by the immigrants. They want them, and are willing to pay $5 a case more. Just so long as the high tariff compels them to do so we do not need any more protection. At the present rate of exchange I am figuring the cost when I say $18 per case.

We also have a great deal of trouble in establishing market value. We would much prefer changing this article also to a specific rate of duty. Before the war, under the Payne-Aldrich, we used to get an average of $1.25 per case duty; we are willing to pay $2 and make the price 1½ cents per pound on gross weight; $3.50 is not fair, because while we want to increase the revenue of this country we do not believe it is just to expect that the poorer class should pay $3.50 duty on a case of goods like this. [Indicating.]

Senator WALSH. Are there any other manufacturers of tomato paste than yourself?

Mr. SCARAMELLI. Plenty of them.

Senator WALSH. Then, do you claim that the tariff simply gives you an opportunity to make profits?

Mr. SCARAMELLI. No; it does not make any profit for us [im- porters].

Senator WALSH. You say you can manufacture yours for less than the imported?

Mr. SCARAMELLI. Yes.

Senator WALSH. And can sell it for less?

Mr. SCARAMELLI. Yes.

Senator WALSH. Is there not a temptation to raise your price in harmony with the figure the imported brings in order to make all that you can?

Mr. SCARAMELLI. Certainly; I understand now, you mean that in charging $3.50 duty I can raise the price on domestic accordingly?

Senator WALSH. So the tariff amounts to being a part of additional profit to you?

Mr. SCARAMELLI. Yes. I believe in protection, but if I can make a reasonable profit I do not want any more.

Senator McLEAN. Is there domestic competition?

Mr. SCARAMELLI. A lot of it.

Senator McLEAN. Does not that regulate the price?

Mr. SCARAMELLI. Of course, consumption and demand regulates the price of almost anything; but the main question is, just so long as the American manufacturer can sell his products to a profit, why should you charge $3.50 on the imported, when $2 would be plenty, and you be treating the poor people with justice? Here is a can of tomatoes. The Fordney bill has reduced the tariff to 10 per cent. Of course, that is right. From 25 per cent in the Underwood tariff the Fordney bill reduced it to 10 per cent. Here is the article [exhibiting can of tomatoes to the committee]. It is not manufactured in this country. This [indicating] is the shape of tomatoes that grow in Italy. At my factory in Maryland I have tried to grow these tomatoes, but the farmers would not grow them, because they said it takes too long to pick them. These are the same size cans as domestic and sell at $3 per dozen and the domestic sell at $1.40. We need no protection, and the Fordney bill did rightfully reduce it to 10 per cent, but we claim that instead of keeping it at 10 per cent, which does cause a lot of trouble in establishing market value, we should change to a specific duty and make it ¾ cent per pound, which will give you the same amount of revenue and we will be much happier and satisfied.

The chamber of commerce has made up a series of briefs, which I am not going to read, but which I am offering to be made a part of the record, with your permission, and in one of them is explained our views on the American valuation, which we do not approve of.

In closing, I say to you that my personal opinion, as I did not have a chance to discuss it with the board of directors of the chamber nor with the members—that in reading the President's message, I saw that if it was possible to apply American valuations on such articles that are destroying the industry of our country it may be a good policy. As a matter of fact, personally, I would prefer this, so long as we dealt with justice on the other side; Europe should see that justice be done to us as well; and if any one of those countries over there are shipping goods here that would mean the closing of the industries of the United States, we should protect ourselves.

If the Tariff Commission could gather information and submit proper changes with the consent and approval of the Senate, I believe that from time to time in these days, with everything upset, we would be able to change our tariff without playing politics with it.

Senator WALSH. You preach democracy and vote republicanism, do you not? [Laughter.]

Mr. SCARAMELLI. No, Senator; I believe in the protection of American industry, but at the same time I do not believe in increasing the tariff when it has a tendency to monopoly.

BRIEF OF L. J. SCARAMELLI, NEW YORK CITY, REPRESENTING THE ITALIAN CHAMBER OF COMMERCE OF NEW YORK.

We beg to submit the following statements and recommendations with regard to custom tariff revision:

CHEESE AND SUBSTITUTES THEREFOR.

[Paragraph 710.]

This chamber desires to bring to the attention of your honorable committee facts which which they feel amply justify their contention that the present and proposed method of assessing duty on cheese demands revision.

The Fordney tariff bill levies a rate of 5 cents per pound on cheese valued at less than 30 cents per pound and a duty of 25 per cent ad valorem on cheese valued at 30 cents or more per pound.

In the first place, this chamber is firmly convinced that the duty should be made specific, as it always has been in tariffs previous to the last, the present ad valorem rate having proved unworkable. That it should not be more than an all-round rate of 5 or at the most of 6 cents per pound.

This chamber is opposed to the ad valorem rate, which we consider difficult of application, a breeder of unnecessary litigation, and in the last analysis working to the detriment of the honest merchant and to the advantage of the dishonest, who has no scruples about undervalueing his wares:

When we consider the diversified character of the cheeses imported—each specialty of the different countries from which they come—you will easily understand the task that confronts the appraiser. To add to this difficulty, is the fact that there are various grades of each of the qualities imported. While theoretically it may be possible, we doubt if a man could be found expert enough to do justice to such a task.

Besides, value is not stable, but varies considerably, and this is especially so at the present time, due to unsettled conditions of the foreign-exchange market. It is [illegible] a hardship on the importer who buys in large quantities or upon contract. He has to enter his goods at times at the value paid by a competitor, who buys in much inferior quantities and with goods contracted for which are not all delivered at one time, but is at times compelled to change his entering price on each shipment to make market price, which puts him at a disadvantage in merchandising his goods at these [illegible] with the importer practically out of this market.

The prices of domestic cheese have greatly receded from the high levels reached during the war. This is entirely due to conditions of readjustment, as the imported have in no way offered competition. We are strongly of the opinion that prices will eventually arrive at a level very near prewar times. The domestic varieties will be affected sooner, as its sources of supply have greatly increased during the war, while the imported, with greatly dimished sources, may be more retarded in the decline [illegible] their prices.

This chamber, in consideration of the above stated facts, recommends an all-round duty of 5 cents per pound. This would supply, as it did formerly, ample protection to domestic production, and would be best as a revenue producer, as any higher increase of duty, especially at this time, would, we believe, prove disastrous to the future importation of cheese.

LEMONS.

[Paragraph 743.]

The duty on lemons, equivalent to about one-half cent a pound in the tariff of [illegible] was increased in the emergency tariff to 2 cents per pound since incorporated in [illegible] permanent tariff bill. Now, it is a well-recognized fact that the only lemons imported into this country come from Italy, which supplied, prior to the war, about 2,000,[illegible] boxes a year, out of a consumption of about 5,000,000. The State of California [illegible] sole source of domestic supply, does not produce sufficient to adequately [illegible] domestic demands. During the hot spell experienced in the past summer this [illegible] illustrated when, in the absence of an adequate foreign supply, discouraged by [illegible] high duty, lemons were sold in the New York wholesale market from $12 to $15 per [illegible] This was a sad imposition upon the public during a time when lemons are most [illegible] and most in demand, and many of the less fortunate were necessarily deprived [illegible] price of their salutary use. These unheard of prices for lemons were due to the [illegible] of an adequate supply to meet the requirements of the hot spell, and may happen [illegible] at any time. With the arrival of additional supplies and the passing of the [illegible] heat these prices soon collapsed and shortly after lemons sold around $3 per [illegible]

This conclusively proves the futility of an excessive duty to stabilize prices, and the ultimate danger to the trade and inconvenience to the public involved in the exclusion of the imported article. This might be even more poignantly and sorrowfully brought home in the event of a failure of the California crop, not without possibility, considering its susceptibility to frosts.

Under the circumstances, we consider that the exigencies of the situation would dictate the encouragement of imported lemons under a reasonable tariff, as a protection to the domestic demand and as a safeguard against excessive prices. The high freight rate of $1.50 per box from California to the East, which was used effectively by the lemon growers in obtaining the advance in duty, has been greatly overcome by transportation by water. It now costs about 65 cents to transport a box of lemons from the Pacific coast by the water route, through the Panama Canal, and there is further a great possibility that rail rates will be materially revised downward in the near future, not to speak of the further reduction which will be made possible by the proposed repeal of the Panama toll act, as affecting American vessels engaged in the coastwise trade.

The importation of lemons, which had contracted during the war to about one and one-fourth million boxes, owing to difficulties of transportation, has since shown tendency to recover, but in such moderate proportion (1,419,000 boxes in 1920) as not to represent any obstacle to the profitable marketing of the domestic production, while operating as a safeguard against any monopoly of the market by the organization of domestic lemon growers.

The unprofitable character of the 1920 campaign, both for domestic as well as for imported lemons, which has been hysterically seized upon by the California growers as an argument for the present prohibitive rate on imported lemons, does not prove any ability on the part of imported lemons to undersell the California product, as it it is a well-known fact that the campaign in question proved disastrous for all concerned. That depression was an unavoidable consequence of after-war readjustment, and especially of the closing of the saloons through the enactment of prohibition and the temporary suppression of this important avenue of consumption, as well as a consequence of the high cost of sugar, and above all, of the cool summer, a factor, the temperature being of great moment in the fortunes of the lemon market.

The depression in the Italian exchange which was brought forward as the main argument for the prohibitive rate of 2 cents per pound enacted on lemons with the emergency tariff is a fallacious argument, since, whatever the disparity of the currency, the cost of merchandise is established on a gold basis, and will be higher or lower in lire according to the fluctuations of the exchange. We may state, on the authority of the New York Fruit Exchange, that, reckoning over a period of years, the seasonal average cost of the imported lemons is about $2.50 f. o. b. Sicily, to which, adding $1.58 as the expense incurred in delivering a box of lemons from Sicily to New York, we reach a total cost, for the imported fruit in New York, of $4.08 per box, against an average selling price of California lemons for the last 16 years of $3.92. Under these conditions we fail to see how a tariff of 2 cents per pound on lemons can be sought for any other purpose than that of stopping importation and securing a monopoly of the American market to domestic growers.

In conclusion, this chamber, from the facts above stated, feels justified in respectfully recommending to your honorable committee that the duty on lemons be reduced to 1 cent per pound, or should this be impossible, no higher rate be imposed than that of the Payne-Aldrich tariff of 1½ cents per pound.

WALNUTS.

[Paragraph 758.]

The Fordney tariff bill raises the duty on this commodity from 2 to 2½ cents per pound for walnuts not shelled and from 4 to 7½ cents per pound for shelled walnuts.

This chamber can not consider that the domestic walnut growers are justified in their contention that they require greater protection by higher duties on this article. The California walnut trade has experienced great prosperity in the last few years. From an output of 9,600 tons in 1910, domestic production increased to 28,100 tons in 1919. Such enormous increase, as these figures represent, does not bear out well the contention of domestic producers that they are not sufficiently protected.

While it is true that the importations during that time have also shown an increase, they are nowise so striking.

The total imports of fiscal year 1913 amount to about 13,331 tons, of which 8,145 were unshelled and 5,186 tons shelled. In fiscal year 1920 the importation had increased to 22,391 tons, of which 13,639 were unshelled and only 8,752 were shelled.

These figures demonstrate that, while in the past 10 years California has trebled its production, the imported show only an increase of a little over 60 per cent in the shelled and of about 70 per cent in the unshelled.

We fail to see how these figures bear out the statement that the California producers have suffered from competition of the foreign nuts. It may, therefore, be stated that besides the increase of production, the enormous prices at which their crop has been sold in the past few years greatly added to the prosperity of those growers. As the imported have not competed with them in quantity, neither have they competed in price, the California product having consistently sold at prices far above those realized by the imported.

It may be noted, however, that in these past few years the high prices obtained have shown a tendency to curtail demand, and the best informed men in the trade realize that, if this trade is to maintain the prosperity it has enjoyed in the past, prices must evidently settle at a level somewhat lower than those lately prevailing.

For these reasons this chamber is opposed to any increase of duty at this time, it being convinced that the present duty, having been sufficient for protection and revenue up to now, will be even more so in the future.

Walnuts, like the other nuts in this schedule, are a nutritious food, and consumption should be encouraged rather than discountenanced. The unshelled walnuts, like all other unshelled nuts imported, are used strictly in connection with baking and the manufacture of confectionery. They compete with no industry in this country, and are a necessary article to the trade which they supply. Coming in, as they do, as a raw material, and competing with no home product, duty should only be levied in the interest of revenue. The present rate of 4 cents per pound should be considered ample for this. Any advance would only embarrass this trade, curtail imports, and cause unnecessary high prices here.

This chamber, therefore, respectfully recommends that the duty of 2 cents per pound on unshelled walnuts and of 4 cents per pound on shelled walnuts be unchanged, and in case that is not possible no higher rates be levied than provided by the Fordney tariff bill.

OLIVE OIL.

[Paragraph 50.]

The Fordney tariff bill proposes a duty of 7½ cents per pound both on container and contents, if in containers weighing with the immediate container less than 44 pounds, and of 6½ cents per pound of olive oil not specially provided for. The emergency tariff levies 50 cents per gallon on olive oil in bottles, jars, kegs, tins, or other packages having a capacity of less than 5 standard gallons each; and of 40 cents per gallon in other containers not specifically provided for in said section.

The proposed rates mean an increase over the present duties respectively of [illegible] cents per gallon on oil in bulk and of 7 cents per gallon on oil in packages.

This chamber desires, first of all, to impress upon your committee the necessity that the duty on olive oil should continue at no higher rates than those of the emergency tariff now in force, which already represent an increase of 100 per cent in the duty on oil in bulk and of 66⅔ per cent on oil in package, over the former rates.

Olive oil is a food of prime necessity and medicine besides to a great number of the population of this country, many among the poorer classes in whose diet it takes the place of butter and other fats, with the advantages of the greater economy and the hygienic benefits, exclusively identified with nourishing, upbuilding, and health-giving qualities.

The war has done considerable, and, if not remedied, irreparable damage to the importation of olive oil into the United States. This importation, which previous to our entry into the war had been increasing annually at a rate of from one-half to [illegible] million gallons, has since decreased to an alarming extent and is still far from recovery, as the following figures will show:

United States imports of olive oil.

	Gallons.		Gallons.
1910–11	4,405,827	1916–17	7,533,14[illegible]
1911–12	4,836,515	1917–18	2,537,51[illegible]
1912–13	5,221,001	1918–19	4,283,1[illegible]
1913–14	6,217,560	1919–20	6,312,[illegible]
1914–15	6,710,967	1920 [1]	4,078,81[illegible]
1915–16	7,224,431		

[1] Calendar year.

The reasons of this decrease are numerous and varied. Production has fallen somewhat during the war, owing to the cutting down of olive trees for wood in some parts of Italy due to the penury of fuel, to the lack of fertilizers not always obtainable, to the ravages of the olive fly, and to the lesser care of cultivation forced by the scarcity of labor, called under the colors. The available supply of olive oil, therefore, is lesser to-day than it was before the war, no new planting, except perhaps to replace dead trees, having taken place in the meantime, and, even if it had, with the slow growth of olive trees, requiring decades before they come into bearing, production not becoming available before at least 15 years, unless olive groves are extended in Italy, which was not the tendency in prewar times, there is not likely to be in future, even in favorable years, an oversupply of olive oil in that country.

According to statistics recently published in the New York Journal of Commerce, the olive oil crop in the Mediterranean countries for the season 1920–21 has been estimated at 597,000 metric tons, the following countries contributing to this total: Spain, 210,000 tons; Portugal, 35,000 tons; Italy, 150,000 tons; France, 10,000 tons; Algeria, 15,000 tons; Tunis, 15,000 tons; Morocco, 12,000 tons; New Greece, 70,000 tons; other countries, 80,000 tons. The total world's production of olive oil was estimated a decade ago as ranging between 733,000 and 916,000 metric tons, the decrease in supply being thus manifest.

While the output has been lesser, the cost of production has, on the other hand, greatly increased. To begin with labor, its cost is now seven times greater than before the war, while the day's work, which used to be from sunup to sundown, has dwindled to eight hours. Then the cost of material has greatly increased, the item of tins and cases alone, which was before the war about 10 centesimi (hundredths) of lira per gallon, having reached now 3 lire per gallon. Maritime freight, which figured at 2 cents per gallon in prewar times, is now 10 cents per gallon. Besides this, consideration should be given to the notable increase that has taken place in the price of the oil itself at the primary markets. The result is that to-day American consumers, finding olive oil out of their reach on account of its exceptional high prices, may be compelled to resort to surrogates, such as cotton, corn, peanut, and soya-bean oils, tending to displace it, not on account of their intrinsic qualities, but by reason of their low prices. The fall in the price of surrogates, such as cottonseed oil, is due in large part to the failure to do the usual export business.

The olive-oil trade should be encouraged in the interest of public health. The medical profession universally indorses its high medicinal properties. It does not compete with any home industry. California, the only State producing a little olive oil, and being, next to New York, the largest consumer of imported olive oil, is not a factor in the olive-oil trade, as it does not even produce enough for her own consumption, and has to import largely of this commodity, notwithstanding the advantages of a 50 cents per gallon protective duty, of a 22 cents per gallon transcontinental freight, and of freedom from any fiscal restrictions as to trade operating as a further protection.

The present total area of olive groves in California was estimated in 1918 by the State Department of Agriculture equal to 31,023 acres, of which only 18,801 were bearing fruit and 12,222 had not come yet into bearing. The yield in 1919 was 14,000 tons of olives. It is estimated that with the entire 31,023 acres yielding their full capacity the total would not exceed 24,000 tons, an output, however, which will require many years before it can be reached. As it takes about 1 ton of olives to yield 40 gallons of olive oil, California could not possibly hope to produce in any one year more than 960,000 gallons of olive oil. This represents only 11½ per cent of the total annual consumption of olive oil in this country, which is estimated, according to the importations for calendar year 1919, at about 8,302,000 gallons. But, as a matter of fact, less than one-half of the California olive crop is pressed into olive oil, the balance being packed into tins and otherwise prepared. E. F. Woodward, a California olive grower and authority on this subject, estimated the California olive-oil crop in 1908 at about 350,000 gallons, and it can not have materially increased since then.

Developments of recent years cause us to view the olive-oil importation from another angle. It is coming more and more to be imported as a raw material entering into and developing industry in this country. In the past few years packers of fish—especially tuna and sardines—have used vast quantities of olive oil in their packing. This is practically a new industry developed since the war, and increased cost of olive oil would greatly retard, if not destroy, it. Besides, the packing of olive oil, imported in bulk, into bottles and tins has grown to considerable dimensions, gives employment to many people, and creates a demand for tins, bottles, shooks, and other materials, all of which benefits industry here.

A slight survey of figures gives us a vivid proof of this. Whereas, before the war in 1913, only about one-third of the olive oil was in bulk, we find that in 1919 this had risen to about seven-eighths of the total importation. So that to-day we must consider and treat olive oil more in the light of a raw material feeding an industry here than as a finished or manufactured article entering into immediate consumption.

On account of the material of American origin that the packing abroad requires the importation of olive oil in this country should be looked upon in the light not of competition but as a stimulus to American industry and trade.

While this chamber is in favor of maintaining a difference as now existing in the rates of duty between olive oil in bulk and olive oil in packages of smaller size than 5 gallons, this difference should remain as it is, in order to encourage the use of oil in its original package, and to give to the consumer the guaranty that is carr with it; to discountenance the mixing of a lower with a higher grade of oil, a because most of the packing material, such as tinplate and shooks, used for the oli oil imported, is after all of American origin, of which Italy is the largest buyer in this country, and for which American packing has the advantage of lesser cost.

If the overseas trade of this country, built during the war, is to be continued, must be prepared to take back some merchandise in exchange, as this country ca not expect to be paid always in gold. To this end, it seems advisable to encourag the importation of an article which is one of the staple productions of the Mediter ranean countries and which does not enter into competition with any home produ and besides aids in the development of business at home. Under such a categor should olive oil be classed.

In conclusion this chamber recommends that the rates of duty on olive oil shou remain as they are at present in the emergency tariff, representing already an increa of from 66⅔ to 100 per cent over the former rates, namely, that they continue at cents per gallon on olive oil in bulk and of 50 cents per gallon on olive oil in co tainers of less than 5 gallons. These rates, while ample for the purpose of protectio are also sufficient for revenue purposes.

CHERRIES IN BRINE.

[Paragraph 738.]

They have been taken from the free list of the tariff act of 1913 and assessed 3 c per pound in the emergency tariff. The Fordney tariff bill has assessed them cents per pound.

Cherries in brine have been imported in former years to the extent of 75,000 barrels. These are in the nature of a raw material for use by confectioners and bakers. Cherr of the variety imported, which are smaller in size than the domestic, are not grow to any appreciable extent in this country, and, therefore, do not enter into compe tion with any domestic product. There is no possibility of any large production this article in this country for many years, as the very nature of the tree requir many years before it will bear in sufficient quantity to be of commercial value. Si the 3 cents impost has been in effect the importation has greatly contracted and sm have been the shipments of cherries in brine this year, greatly to the detriment the American confectionery industry, which depends so much upon that import product.

This chamber therefore recommends that, if it is not possible to return them to free list, where they should be, they should be assessed no more than proposed by Fordney tariff bill, namely, at the rate of 1½ cents per pound.

FILBERTS.

[Paragraph 755.]

The Fordney tariff bill raises the duty from 2 to 2½ cents per pound on filberts shelled and from 4 to 5 cents per pound on shelled filberts.

Filberts are not produced in this country in a commercial way, so that the ques of protection to domestic industry has no bearing in the consideration of the du this article.

As a means of revenue, we consider that the present duty, of 2 cents per pound the unshelled and 4 cents per pound on the shelled, is sufficient. Any mate increase in these rates, we are convinced would curtail consumption and defeat ends of revenue.

The unshelled filberts are used chiefly for domestic consumption, and, while exactly a luxury, experience has taught us that a too enhanced value easily

make them become a luxury. At convenient prices, on the other hand, they are readily sold. High prices practically destroy their demand. This has been more than once illustrated in the case of the high prices that have prevailed during the war.

The shelled filberts are consumed almost entirely as a raw material in baking and in the manufacture of candy. To increase the duty it would only add an unnecessary burden to their trade, which would eventually show decrease in demand, as the trade would be forced to use cheaper substitutes.

That the present tariff has worked well for revenue is shown by the fact that importations, from 8,480,118 pounds of unshelled and 1,946,488 pounds of shelled nuts, under the old rates of 3 cents and 5 cents per pound in fiscal year 1913, yielding, respectively, $257,588 and $72,531, with a total in duties of $330,119, increased to 20,581,528 pounds of unshelled and 6,970,072 pounds of shelled nuts, yielding in revenue, respectively, $411,628 and $288,802, namely, a total of $700,430 in 1920 under the present rates.

From the foregoing statement, this chamber concludes that the prevailing rates are the best adapted for the needs of revenue and respectfully recommends that the present rates of 2 cents per pound for unshelled filberts and 4 cents per pound for shelled filberts be continued as they are.

TOMATO PASTE OR SAUCE.

[Paragraph 770.]

The Fordney tariff bill raises the duty on tomato paste from 25 to 28 per cent.

Prior to the war, the importation of this article was about 300,000 cases annually. During its forced absence, American manufacturers have tried to supply this demand, but the greatest output scarcely exceeded 100,000 cases. This is chiefly due to the fact that the domestic product does not attain the high flavoring qualities, nourishing value, and color of the imported. For this reason many consumers have preferred to do without it, rather than use the domestic sauce, which they found unsatisfactory, and consumption was, therefore, curtailed. Prior to the war the domestic, then an insignificant factor, sold at $4 per case of 200 tins of 6½ ounces each, and the imported for about $8. During the early part of the war the price of the imported soared as high as $24 per case, at which price it was preferred to the domestic, which had risen to $12. With the passing of the imported from the market, owing to embargoes, the domestic sold as high as $18 per case, consumption fell considerably, and never reached over 30,000 cases per year. While the cost of production may have increased during the war, it was not enough to justify the rise from $4 to $18 per case. It was simply taking advantage of the absence of the imported. The higher the tariff burden on the imported, the greater the chance given to the domestic to take advantage of the market, profiteering to the detriment of the consuming American public. This article is essentially a part of a poor man's diet, and, going on record in favor of a specific duty equivalent to the present ad valorem rate as applied to prewar or normal prices, this chamber recommends that the duty be assessed at 1 cent per pound.

This rate will approximately assess this commodity at the same duty which prevailed before the war, and, furthermore, taking into account the prewar market price for this commodity, the duty recommended by this chamber will approximately be the same as the duty which is now levied on this article under the present tariff.

CANNED TOMATOES.

[Paragraph 770.]

The Fordney tariff bill provides a duty of 10 per cent on canned tomatoes.

The variety of canned tomatoes imported from Italy is the egg or pear shaped description, not canned here. It could never come in sufficient quantity to seriously affect the immense American pack of tomatoes, which is the largest in the world, and has little to fear from this imported specialty. This is true as to price as well as to the quantity and quality.

Calculating a specific duty on similar lines as above, this chamber recommends a specific rate for this product of one-half cent per pound, which is equivalent to the proposed 10 per cent.

ARTICHOKES, PEPPERS, AND OTHER PRESERVED CANNED VEGETABLES.

[Paragraph 773.]

Likewise artichokes, peppers, and other preserved canned vegetables, which, while grown, have never been successfully canned here in any quantity and which the Fordney tariff bill assesses like the present tariff at 25 per cent, should also be assessed at the same rate of specific duty of 1 cent per pound.

PRESERVED FISH.

[Paragraph 721.]

Many of the varieties of imported fish are assessed under paragraph 721 of the Fordney tariff bill at the rate of 26 per cent ad valorem if packed in oil, and at the rate of 20 per cent if salted and in immediate containers, weighing with their contents not more than 30 pounds each, and at the rate of 1½ cents per pound if in containers weighing with their contents more than 30 pounds each, including the weight of the immediate container with the contents. They generally follow the lines of other imports in being specialities, and as a rule not found or not much produced in this country. Some, like the anchovies, have not adequate substitutes here. Of other qualities, like tunny, while good imitations are packed on the Pacific coast, it may, however, be said that they are not the same type of fish. The tunny from the Pacific coast, while an excellent fish, has not the taste of the Mediterranean and does not adequately supply the wants of those seeking the latter. While sardines have been extensively packed in olive oil during the war, they have not succeeded, however, in acquiring the patronage of the consumers of sardines. The latter-day demand is falling off considerably for these articles, showing conclusively that the discriminating public, when it can not have the genuine article prefers to do without it.

Duties should, therefore, be assessed so as not to put too great a premium on the justifiable satisfying of the wants of this particular consuming public. The fish, packed in oil, is now to be assessed 26 per cent. Following our suggestion to make rates of duty specific, and equivalent to the present ad valorem rate as applied to normal prewar prices, this chamber recommends that the duty on fish in oil be placed at 2½ cents per pound. As to fish in brine, this chamber recommends that it be assessed at the specific rate of 1½ cents per pound, excepting salted sardines or sardelle, which is a cheap variety of fish not prepared in this country, for which this chamber recommends a specific duty at the rate of 1 cent per pound.

PEAS AND BEANS, PREPARED AND PRESERVED.

[Paragraphs 763 and 767.]

The Fordney tariff bill raises the duty on these commodities from 1 to 2 cents per pound, an increase which this chamber considers excessive.

There is no question that, considering the advantages of modern facilities employed in packing and the vaster supply of the raw materials, prepared vegetables can be packed at least as cheap in this as in any country of the world, even allowing for the higher cost of labor, the difference of which in the aftermath of war is comparatively less to-day than it once was. In general, during the war the importation of the articles covered by the above-stated paragraphs was practically stopped by embargoes placed by foreign Governments on the export of food products from their respective countries. A survey of statistics gives us ample proof of this, as imports of prepared vegetables, which in fiscal year 1914 had reached the total of $4,710,137, fell to $1,593,[illegible] in fiscal year 1919.

This chamber, while considering the rates superfluously high, and believing that 1 cent per pound would be ample, indorsed, however, the principle of assessing the duties on preserved vegetables, and generally on food products whenever practicable, on a specific basis. Ad valorem duties are always more or less breeders of misunderstanding or litigation. Many times the honest importer becomes an innocent victim. The dishonest is ofttimes benefited. Specific duties would do away with these injustices and the unpleasantness of litigation.

Value is a fluctuating quantity and is not easily arrived at. This is more so in the case of imported articles, which are more or less specialties, and in the case of which prices vary according to the prestige of the different packers. Another fault of the ad valorem duty is that it presupposes that all exporters sell and all merchants here purchase at the same price, as the entering price is the same for all.

This is far from true and works to the detriment of the larger operator or of the brewder merchant. It works to the disadvantage of the man who buys on contract or future delivery, as the entering prices may be changed on each arrival and place him at times in great difficulty to ascertain the proper entering value. It increase the hazard of the importer's speculation, for, besides the danger of fluctuation of the goods, he must also contend with similar fluctuation in the duty.

HEMP AND HEMP TOW AND HEMP HACKLED, KNOWN AS "LINE OF HEMP."

[Paragraph 1001.]

The Fordney tariff bill takes this raw material from the free list and levies on hemp and hemp tow a duty of three-fourths of 1 cent per pound and on hackled hemp 1½ cents per pound.

Hemp is a raw material essential to and largely employed in the manufacture of high-grade cordage and twine, in which is required great tensile strength, of shoe and harness threads, in which like qualities are also of primary importance, of carpet yarns, and of rough linens; all uses, these, for which the Italian raw hemp has valuable qualities of its own, far superior to all other hemps, that can not be substituted by any other fiber. The best twine, for special purposes, are made of this material, which has strength and durability superior to those of any other hemp, surpassing them in quality and usefulness.

It is, therefore, important that this article, representing a raw material necessary to American industry, should be maintained on the free list, where it was placed at the last tariff revision, in recognition of the just claims of American manufacturers of cordage, twine, carpet yarns, and linen to have it exempted from fiscal burden. Any duty on it now would be a hindrance to American manufacturers, and a burden to American consumers, who for special purposes can not do without it.

According to the census of 1914, the cordage, twine, and linen industries of this country alone used 22,752,353 pounds of hemp and hemp tow, valued at $1,861,817, against 19,724,070 pounds for $1,496,125 in 1909. Of the amount used in 1914, ,318,771 pounds valued at $1,583,354 were manufactured into hemp twine, an increase over the corresponding production of 1909 of 8,013,349 pounds, valued at 1,091,291. In 1914, 5,707,668 pounds, valued at $3,409,136, of linen thread and ,739,628 square yards for $1,765,798 of linen fabrics were produced in the United States, showing increased value in comparison to 1909. The fact that, besides the cordage, twine, and linen industries, with a yearly aggregate output of products valued $65,000,000, the use of hemp is allied to a good many others, such as the carpet industry, representing alone a yearly production of $69,000,000, shows how wide is the field of application and usefulness of this article.

Hemp was largely imported before the war. In fiscal year 1914, 8,339 tons, valued $1,472,460, were received. Although war restrictions and requirements interfered with this trade during the last five or six years, and a difficulty in procuring this material was experienced in every industry using it, because of its having been requisitioned for war purposes, with the cessation of hostilities it again became available in the usual channels of commerce, but under the disadvantage of the high prices to which the war has raised this article, as shown by an average cost of $666.25 in 1919 against $177.34 per ton in 1914, little has so far been imported.

Its use will unquestionably increase with the approaching of normal prices, provided its cost is not increased by a duty impost, which would be injurious to many industries hitherto employing this hemp, and made possible by reason of its freedom from duties. As it can not be substituted by any other material, its higher cost and consequent lesser use would only cause less efficiency and lesser possibility for American manufacturers of competing successfully in the world's markets with their products.

This chamber does not ignore that the high prices which have prevailed during the war have stimulated the production of hemp in the United States, especially in the fertile limestone soils of the blue-grass region of Kentucky, in the rich prairie and limestone soils of Wisconsin, on the alluvial bottoms and basins of California, and on the muck lands of Ohio, Indiana, and Michigan. Production in this country has developed under the present fiscal regime of exemption from duty, because the price of hemp has been profitable. Otherwise it will pay the American farmers far better to grow other crops, such as wheat and tobacco, giving better financial returns. In fact, notwithstanding the protection at first of $20 and then $22.50 per ton on hemp, which existed in the two tariffs that preceded the present, domestic production never exceeded a yearly output of 5,000 tons, and was usually below that figure; while in

1917, without any protective duty on hemp, whether raw or hackled, domestic pr duction was reported to have increased to about 25,000 tons.

The growing of hemp is in a thriving condition, because machinery has brou about a revolution in this industry. Hemp is now grown and handled as easily a staple American crop. The drudgery of hand labor has been eliminated, and the few years' crops have been handled throughout by labor-saving machinery. Pr viously the crudest devices had been used in growing and handling the crop, wit excess of hand labor that made the production too expensive. All this has changed.

The hemp harvester, which was used for the first time in 1917, has become other specially devised machinery now used in this country, a revolutionary f in hemp production. This machine, another American invention to be proud of, and spreads the hemp stalks at one operation, and it does a better job of spreading retting than is done by hand, as they still do abroad. And while prior to 1917 lifting and breaking of the stalks was done by hand, now a gather binder is used

Central mills for breaking the hemp stalks and cleaning the fiber by efficient chinery are another recent and far-reaching addition to the hemp industry breaking and scutching process, which remained a back-breaking drudgery recent years, is now performed in this country entirely mechanically, so that production of hemp, from the time when the seed is planted in the ground latter stages of elaboration of the fiber in its finished baled condition of hemp, of hemp, and hemp tow, is performed by such modern and improved labor-saving chinery as to reduce the factor of labor in its cost of production to a minimum. to these improvements, hemp is produced to-day in this country, notwithstandi the higher cost of labor, far more cheaply than abroad, where hand labor still pr requiring a far greater number of operatives to perform the same work which is done by machinery with very little help.

The above is sufficient evidence that the hemp industry has not only been tained but actually prospered without governmental aid. It has, in fact, a competitor of the imported, now confined to the manufacture of high-grade as shown by the decreased importations of this article since 1917, the year that the revival of the American hemp industry, when importations have been as fol Fiscal year 1917, tons 9,635, valued at $2,487,477; 1918, tons 6,813, worth $2,7 1919, tons 2,396, valued at $1,601,349; 1920, tons 4,076 for $1,735,273.

From the foregoing facts it is evident that no duty is needed by American gr of raw hemp for the purpose of protection, as their industry, under free trade grown to such an extent that it is capable to exist and prosper on its own me Further, that exemption of hemp from duty means protection to American ma facturers, who, by the free avenues of supply of this raw material, are enabled develop the production of the manufactured article and to stimulate consum of which the first to benefit is American production. Furthermore, that the ing of any duty on raw hemp would yield very little revenue to the Govern $100,000 or $125,000 at the most, would handicap manufacturers, and bring no to the growers.

This chamber, therefore, respectfully recommends that hemp and tow of he and hemp hackled, known as line of hemp, which does not advance it further th condition of raw material, be returned to the free list.

HEMP YARNS.

[Paragraph 1004.]

Imported now under duty on the basis of 12 per cent ad valorem on yarn no than 8 lea or number; 20 per cent ad valorem finer than 8 lea or number and finer than 80 lea or number; finer than 80 lea or number, 10 per cent ad valor it is strongly recommended that these duties be maintained without the incre proposed by the Fordney tariff bill, which would levy on single hemp yarns not than 8 lea, 8 cents per pound, but not less than 20 per cent; finer than 8 lea and finer than 60 lea, 8 cents per pound plus one-half cent per additional lea, but less than 23 per cent; finer than 60 lea, 35 cents per pound, but not less than cent. The proposed increases would stop all importation of a semiraw mat such as this, which is in the interest of American manufacturers in various lin industry to obtain at the least possible cost.

Previous to 1913 yarns of this nature were not imported to any extent, and over the figures showing the importation for the following years, it is to be that, while not in very large quantities, these yarns were, however, import quantities varying from several thousands of pounds in 1913 to about 300,

,000 pounds in 1914, and about 1,000,000 pounds in 1915–16, decreasing again in down to zero in 1918, on account of transportation difficulties and export restrics at countries of origin. In 1919 the importation again started, reaching about 0,000 pounds in 1920.

hat has been imported is almost all yarns of the coarser grades suitable for twine cordage making or for filling purposes in the manufacture of carpets. The conption of this yarn by the home industries, is without comparison, by far, greater the amount of pounds imported and likely to be imported in the future under present tariff, which proves that the present tariff protects amply the home stry of hemp yarns. It gives, in fact, possibility of importation on a very comtive price and on a very small scale; while on the other hand it is very advanous to American industries using these yarns, as this competition keeps the price just level (the raw material being free of duty) and assures the consumer of havalways the best material, which answers its purpose best.

ported hemp yarns, especially those not finer than 8 lea, supply a pressing need e American carpet industry. Yarns of this class are scarcely manufactured in United States owing to the difficulty of production, and to the objection of labor e hard work necessary to their manufacture. Some spinners have been coml to abandon the production of this line of yarns because of unwillingness of labor rk at it, so that there are only two or three spinners in the United States producing kind of yarns and providing an insufficient supply of same for the needs of the rtant carpet industry of this country. Carpet manufacturers are therefore coml to resort to more expensive substitutes, to the detriment of their industry.

returning the raw hemp on the free list (therefore placing the American yarn facturers from the start on the same basis of the foreign), it would seem that a ranging from a minimum of 12 per cent to a maximum of 20 per cent ad valorem ld protect the American manufacturer to such an extent (also in consideration of t that the ocean freight and insurance on yarn is evidently much higher than ean freight on raw material) that any higher duty should be unfair to the ultimate ican consumer of the yarn.

wever, it seems as if a lower rate of duty should be advantageous to American t manufacturers on these yarns, as the price of same would consequently lessen. present basis of duty guarantees a steady revenue to the United States Treasury, on the basis of 12 to 20 per cent must have varied, it is presumed, anywhere $20,000 to $50,000 yearly. If the duty should be increased, this revenue would ubtedly be stopped immediately.

chamber, in consideration of the above-stated facts, recommends respectfully the proposed rates of the Fordney tariff bill on hemp yarns be reduced 75 or 50 cent less than the proposed figures; and, should this be impossible, then that they replaced by paragraph 341 of the Payne-Aldrich tariff (1909) substituting, however, ad valorem rates therein stated by equivalent specific rates.

HEMP THREADS, TWINES, OR CORDS.

[Paragraph 1004.]

The Fordney tariff bill assesses duties on threads, twines, and cords not finer than 8 , 16 cents per pound; finer than 8 lea and not finer than 60 lea, 16 cents per pound d three-fourths of 1 cent for each additional lea or part of lea in excess of 8; and r than 60 lea, 56 cents per pound; but in all such cases not less than 23 per cent.

The importation of these articles has been practically nil under the present tariff of per cent if not finer than 5 lea and of 25 per cent if finer than the proposed Fordney much higher than even the Payne-Aldrich tariff rates would make importation lutely prohibitive.

The chamber therefore respectfully recommends that the proposed rates on threads, es, and cords of the Fordney tariff bill be reduced to 75 or 50 per cent less than the osed figures; and should this be impossible, then that they be replaced by paraph 340 of the Payne-Aldrich tariff of 1909.

LEATHER GLOVES.

[Paragraph 1433.]

his chamber does not ignore that the manufacture of gloves has become an imtant industry in the United States, turning out, according to the census figures 914, 3,082,376 dozen pairs of gloves, valued at $21,614,107. Compared to these res, the 562,018 dozen pairs of gloves, valued at $7,920,750, imported in fiscal

year 1920 are a relatively unimportant factor, importation supplying only one-fifth of the consumption.

The gloves import trade has been hurt considerably by war conditions, which have practically reduced it to one-half of its former level of 1,183,443 dozen pairs, imported in fiscal year 1913. This has given American manufacture an opportunity to replace the gloves formerly supplied by foreign countries, a trade which has labored since the war with restrictions and difficulties of all kinds, chiefly lack of materials, increased cost of production, and taxation, higher freights and insurance rates.

To-day imported gloves play but a secondary rôle in the supply of American consumption, and their field is practically confined to women's gloves, which is not the principal line of production in this country. While, in fact, 76.8 per cent of the domestic production was in 1914 of men's gloves, 9.4 per cent of gloves for boys, only 13.8 per cent represented women's and children's gloves. On the other hand practically 9[illegible] per cent of the importation in fiscal year 1920 was of women's gloves, and only [illegible] per cent of men's gloves.

Importation, therefore, takes place in a line of production that affects the least the domestic manufacture. The latter, notwithstanding the higher cost of labor in this country, can partly offset this disadvantage by more intensive, more systematic and quicker methods of production, by lesser cost of power, by greater economy in freight and distributing expenses, and by the privilege of nearness to market. By the further aid of reasonable and not prohibitory duties, which are sufficient for protection on an article, like gloves, of ordinary apparel and not a luxury, is well able to maintain its dominant position in the supply of consumption, notwithstanding any temporary ability, through abnormally depreciated exchange, of foreign manufacture to supply this market at attractive prices. Any such possibility is, however, only temporary, as no stable business can be developed on a unstable exchange, which is bound to recover from its present depression in a no distant future.

Had it not been for the fact that the rates on gloves of the Underwood tariff are not of a prohibitory character, importations would have been impossible since the war. Now that it is showing symptoms of recovery, after unprecedented difficulties, it should not be killed by the reenactment of prohibitive rates such as those proposed in the Fordney tariff bill equivalent to an increase of at least 100 per cent on foreign cost.

This chamber, after careful study of the fiscal régime on gloves, begs leave to submit hereunto a comparative statement of the present (Underwood) and the proposed (Fordney) rates, together with its own recommendations in the matter, to which it respectfully bespeaks the consideration of this honorable committee:

Gloves (leather).

	Underwood tariff.	Fordney bill.	Our recommendations.
1. Men's, women's, or children's glace-finish Schmaschen (of sheep origin).	Not over 14 inches in length, $1 per dozen pairs and 25 cents extra per dozen pairs additional for each inch in excess of 14 inches.	Not over 12 inches in length, men's, $4; women's and children's, $3 per dozen pairs and 50 cents extra per dozen pairs for each inch in excess of 12 inches.	Not over 14 inches in length, $1.50 per dozen pairs and 25 cents extra per dozen pairs for each inch in excess.
2. All other women's and children's gloves wholly of leather.	Not over 14 inches in length, $2 per dozen pairs and 25 cents extra per dozen pairs for each inch in excess.	....	Not over 14 inches in length, $3 per dozen pairs and 25 cents extra for each inch in excess.
3. All men's leather gloves, n. s. p. f.	$2.50 extra per dozen pairs.	....	$3.50 extra per dozen pairs.
4. If lined with cotton or other vegetable fiber.	25 cents extra per dozen pairs.	$2.40 extra per dozen pairs (except if lined with leather).	75 cents extra per dozen pairs.
Lined with knitted glove or with silk, leather, or wool.	50 cents extra per dozen pairs.	....	
Lined with fur...........	$2 extra per dozen pairs..	Lined with fur or leather, $4 extra per dozen pairs.	$3 extra per dozen pairs.
All pique and prix seam gloves.	25 cents extra per dozen pairs.	Embroidered or embellished, 40 cents extra per dozen pairs.	40 cents extra per dozen pairs.

ARGOLS OR CRUDE TARTARS AND WINE LEES, AND TARTARIC ACID.

[Paragraphs 1 and 9.]

Argols and tartaric raw materials, containing no more than 90 per cent of potassium bitartrate, are subjected by the Fordney tariff bill to a duty of 5 per cent ad valorem, namely, to the same rate as at present in force and containing above 90 per cent of potassium bitartrate to 5 cents per pound, the same rate being levied on cream of tartar and Rochelle salts; tartaric acid is rated at 6 cents per pound.

The proposed rates represent an increase of 100 per cent on argols containing more than 90 per cent of potassium bitartrate on cream of tartar and Rochelle salts, and an increase of 87.50 per cent on tartaric acid.

Argols and wine lees are the raw materials from which cream of tartar, Rochelle salts, and tartaric acid are manufactured. They are by-products of the wine industry, the only available source of tartaric acid which has not yet been obtained synthetically. Tartaric acid and its salts are used chiefly in the preparation of medicinal compounds and of food products, as in baking powders and beverages, as mordants in the printing of fabrics and in other technical uses. The most important use is in the manufacture of one variety of baking powder, extensively consumed in this country in domestic bread making and also exported. The yearly output of the baking-powder industry alone represented in the United States, according to the census of 1914, a value of nearly $22,500,000 and an invested capital of over $35,000,000, giving work to over 3,600 persons. Exports of these, which had, like the industry, been steadily increasing, represented in fiscal year 1918 nearly $2,000,000. Even before prohibition was enacted, which cut off any American supply, the American wine industry furnished only 1 per cent of the world supply of tartaric raw materials. This country to-day is wholly dependent upon the wine-making countries of the Mediterranean, and chiefly upon Italy, France, Algeria, Spain, and Portugal, for its importations of tartaric raw materials. Importations, taking one year with another and allowing for war or tariff conditions, have been pretty steady, with a tendency of late years to increase, as shown by the fact that, while during the first five years of the past decade they averaged yearly about 28,035,000 pounds, they have during the last five years averaged 30,050,000 pounds.

It has been the traditional policy of the United States to encourage the importation of these crude materials, and this policy should be adhered to by leaving unchanged the present ad valorem rate of duty on argols or crude tartars and wine lees, which befits a product the value of which varies according to its actual contents in tartaric acid.

Imports of cream of tartar gained with the removal of the 5-cent rate which obtained previous to fiscal year 1914, and had kept importations for the period 1911–1913 at a yearly average of 57,710 pounds. The present rate of 2½ cents per pound, which replaced the former in 1914, has increased importations to a yearly average for the three fiscal years ending June 30, 1918, to 68,556 pounds, the large amounts imported in 1914 and 1915, respectively, of 812,857 and 764,868 pounds being due not solely to the change in the tariff but mostly to the stress of war conditions, stimulating importations in order to provide for emergencies as evinced by their falling back to a more conservative average in the following years. This shows that the readjustment of the rate under the tariff act of 1913 has operated advantageously for the interest of revenue and practically without prejudice to American refiners, as the unabated, in fact increased, imports of raw materials clearly demonstrate.

A somewhat analogous course is shown by the importations of tartaric acid, which from a yearly average of 149,014 pounds for the period of fiscal years 1909–1913, when the rate was first 7 and then 5 cents per pound, increased with its reduction to 3½ cents in the last tariff act to an annual average of 393,588 pounds during the last five fiscal years, after having attained somewhat striking totals in 1914 with 848,574 pounds, under the stimulus of the tariff change, and in 1915 with 820,105 pounds under the stress of providing for war emergencies. It is true that importation from a moderate increase in previous years, accentuated somewhat in 1920, when a total of 797,367 pounds was reached; but this is solely to the exceptional conditions of the foreign exchange, which have prevailed during that period, the only time when it became possible for foreign manufacturers, on account of the unprecedented depreciation of the lira, to sell their articles to any extent on this market, which had always before been controlled almost entirely by home manufacturers. Had it not been for the exceptionally abnormal exchange, foreign manufacturers would not have been able to sell to any appreciable extent on this market, the tariff having, since the war, played a relatively unimportant rôle in influencing imports into the United States in comparison to the exchange, with its striking fluctuations.

The present spasmodic conditions of exchange can not, however, last much longer, as they are neither in the interest of Europe nor of this country. A more settled and stable condition is bound to follow in the no great distant future, and it would unquestionably be unfair and inequitable to base our calculation in assessing duties to-day on the existing disparity, which can not endure. If they were so based, upon return to more normal conditions the protection accorded to domestic manufacturers would be increased to such extent as to work prohibitively on importation, and, while giving the manufacturers in this country an undesirable monopoly of the market, would also void the purposes of revenue and destroy a sound competition that alone would ultimately benefit the consumer.

The cost of manufacture in Italy has increased greatly since the war, labor being paid now for an 8-hour day fivefold what it received before the war for a 9-hour day. In the supply of materials required in the manufacture other than tartaric raw materials it is almost superfluous to state that Italy is at a great disadvantage when compared with this country, expecially in the items of machinery, coal, and chemical supplies, which it has to import from this country, on which it has to pay freight and duty, and which offset any disadvantage of the American manufacturer for the difference of freight paid on the greater bulk of the tartaric crude material in comparison to the finished products.

As soon as an improvement in exchange shall have eliminated that the margin which only of late has made possible importations into this country, and as soon as a more settled state of industrial conditions, both here and abroad, shall have made more stable the present fluctuating cost of production, it will be seen that the present rate on tartaric acid is sufficiently protective for domestic manufacturers, who have found in the increased consumption of tartaric acid, through the enactment of prohibition, a compensating factor for the temporarily increased imports of this useful organic acid.

On the contrary, the proposed increase from 3½ to 6 cents per pound on tartaric acid could operate as injurious to the importation of this commodity as did the Dingley rate of 7 cents and the Payne-Aldrich rate of 5 cents, which practically killed the import trade.

The present rates of 3½ cents per pound on tartaric acid and of 2½ cents per pound on cream of tartar have stimulated imports without visible prejudice to American manufacturers, whose importations of crude materials have continued to be equivalent to more than five times those of the refined articles, and appear therefore to this chamber as the optimum rates both for the purpose of revenue and for that of protection, and this chamber therefore asks that they continue unchanged. Should, however, an increase be deemed unavoidable, this chamber respectfully recommends that the rate on tartaric acid be fixed at no more than 5 cents per pound.

CITRATE OF LIME AND CITRIC ACID.

[Paragraphs 1 and 46.]

The Fordney tariff bill places a duty of 7 cents per pound on citrate of lime, an increase of 700 per cent against the present duty of 1 cent per pound, on raw material necessary to American industry and hardly produced in this country.

Citrate of lime, the raw material from which citric acid is manufactured, is an indispensable material to American manufacture, of which this country imported annually before the war between five and six million pounds and to a somewhat greater extent in fiscal years 1915, 1916, and 1917 to make up for the lesser amount imported in 1914, when it had just been taken off the free list, and placed for revenue purposes under a duty of 1 cent per pound. During the two fiscal years that followed our entry into the war, importations were restricted owing to the unsettled conditions of shipping, so that receipts in fiscal year of 1920, amounting to about 10,500,000 pounds, made up for the deficiency of the two previous years.

While California has, since the war, started the industry of citrus by-products, its production is still of small importance in comparison to the large amount of citrate of lime needed by American manufacturers of citric acid. In 1919 the California production of this raw material was reported equal to about 232,000 pounds, and that of citric acid to about 75,000 pounds, which means that California does not supply at the present time more than 5 per cent of the citrate of lime annually imported in the United States, and does not produce more than 2 per cent of the citric acid manufactured in this country. Even allowing for such increase in the output of domestic citrate of lime as seems reasonable, in view of 75 per cent increase in acreage of now nonbearing lemon trees coming into production in the distant future, it is hardly to be expected that the output of citrate of lime in California would

rease to any important percentage of the supply needed by American manufacturers of citric acid. The production of it has increased from 2,102,256 pounds in 1916 to ,032,897 in 1917, notwithstanding the lowering of the rate of duty from 7 to 5 cents per pound at the last tariff revision, which deduction, while it increased importations from a yearly average of 78,964 pounds during the period of fiscal years 1910-1913 to an average of 571,765 pounds since 1913, did not reduce the average annual importation of citrate of lime into this country. The latter increased on the contrary from a yearly average of 5,152,864 pounds in the period 1910-1913 to one of 5,867,000 during the last seven fiscal years ending June 30, 1920. This shows that the moderate lowering of the rate on citric acid has not worked to the prejudice of American manufacturers, while any loss to revenue ($10,435) has been amply offset by the gain from the 1-cent rate on citrate of lime ($58,670) assessed for revenue purpose.

The manufacture of citrate of lime in Sicily, from which is derived 95 per cent of our supply of this imported raw material, is an important feature of the lemon industry, of which it absorbs the culls, representing about 30 per cent of the lemon production. It had to be organized in a sort of cooperative form to insure its existence from the ruinous depression that ruled formerly. During the war, which had a depressing effect on the exportation of the fruit, owing to unsettled shipping conditions, it converted into citrate of lime the surplus cull production, which was somewhat greater than usual, but owing to the scarcity of labor, the shorter hours of work, at least the fivefold increase in wages, and the much higher cost of coal and other materials the cost of manufacture has also augmented greatly the price of citrate of lime, which was 8? 5 lire per quintal, having risen to 700 lire per quintal in 1919.

Under the increased cost of this raw material and other disadvantages confronting manufacturers in this country, such as increased freights, increased costs of labor and materials, etc., and considering that even for a good many years to come California will not be in a position to supply any appreciable amount of this article, we believe that no higher duty than the present rate of 1 cent per pound should be levied on citrate of lime and such is the earnest and respectful recommendation of this chamber.

The Fordney tariff bill proposes a duty of 12 cents per pound on citric against 5 cents in the present tariff.

Citric acid is consumed principally in the manufacture of beverages and effervescent salts; also in some lines of technical use. After the spurt in imports, caused by the shipment in 1914 of amounts which had been held up previously in expectation of a tariff change, and in 1915 by war-emergency requirements, especially since New York replaced London to a large extent for the reexportation of citric acid to Central America, the West Indies, and Far East, it was only with the abnormal conditions of exchange, which in this, as in many other cases, has influenced importations more than the tariff itself, that any chance of business has existed for imported citric acid, a condition which is only temporary and will disappear as soon as the exchange shall have dropped to a less abnormal level, an improvement which can not be too far distant.

It would be not only unwise, but also unfair, in the present unsettled and particularly hysteric condition of the exchange, when cost of production abroad, as well as here, can not always be reliably calculated, to base rates of duty, which are destined to become permanent, on criteria to offset the depreciated currency of the country of origin, as, upon return to more stable conditions this would eliminate any further possibility of importation and give the manufacturers in this country a monopoly of a market which they are unable to supply.

If cost of production has increased in this country since the war, it has to a far greater extent augmented on the other side, where the economic changes brought about by the war have been felt even more acutely than here, in the cost of labor no less than in that of fuel and materials other than citrate of lime, in freights no less than in overhead expenses, without the favorable prospect for increased consumption of citric acid shown by this country since the advent of prohibition.

The domestic industry, notwithstanding the higher cost of labor enjoys over Sicily decided advantages in the cost of production of citric acid. In fact, while citrus culls in California are shipped to the factory by the carload, in Sicily they have to be carried in most cases by animal traction at a relatively higher cost of transportation. Moreover, the cost of fuel and materials, important items of the cost of production, is higher in Sicily than in this country, and the wider use of labor saving machinery by domestic manufacturers counterbalances to a great extent the higher cost of labor.

With reference to a statement made by H. M. May of the Exchange Products Co. of Corona, Calif., before the Ways and Means Committee of the House, relative to the cost of working 1 ton of lemons into citric acid, reported in a total of $14.76, equal to a unitary cost of citric acid of cents 36.9, this chamber wishes to point out that the reported items of said cost are rather exaggerated, especially the item of labor reported for 1 ton of lemons equal to $4.69, as 3½ hours of labor required for such elaboration are

certainly not paid in California, $4.69. The unitary yield of citric acid from 1 ton of lemons is moreover reported of only 40 pounds while it is in fact of 43.69 pounds, which would lower to 31.5 cents the unitary cost of production of citric acid.

Under the present rapid readjustment to a prewar base of the price of citric acid the present 5-cent rate represents already a protection of over 10 per cent to the American manufacturer.

In consideration of the afore stated facts, showing that the present duty of 5 cents per pound on citric acid, while sufficiently protective for American manufacturers, is also the safest for the purposes of revenue and the interest of consumers, this chamber recommends respectfully that it be maintained unchanged and that, should an increase be unavoidable, a return to no higher rate than that of 7 cents per pound of the Payne-Aldrich Act, be adopted.

CITRON AND CITRON PEEL IN BRINE AND ORANGE AND LEMON PEEL IN BRINE

[Paragraph 740.]

Citron and citron peel is not produced in this country and has to be imported entirely for the requirements of confectioners, which is done by shipping this raw material of the candying industry preserved in brine. This commodity has always been admitted free of duty, but the Fordney tariff bill places a duty on it of 2 cents per pound, wholly unjustified, as there is no domestic industry to protect, and the import amounts, therefore, to a burden on confectioners and consumers.

Likewise the orange and lemon peel referred to in the above paragraph is the peel of these fruits, shipped in brine, for the purpose of candying or preserving. It is essentially a raw material required by confectioners and not obtainable in commercial quantities except from the countries where the citrus-fruit by-products industry makes this by-product available. The quantity produced in California, where the citrus by-products industry has just been started, is yet insignificant in comparison to the demand. Importation of this article is therefore devoid of any competitive character.

It is important that manufacturers of candied fruit in this country should obtain these products as cheaply as possible, which could not be the case if they were burdened with duty. For obvious reasons, making further explanation superfluous, this chamber, in the interest of American industry and labor, earnestly entreats your honorable committee to return these articles to the free list.

ALMONDS.

[Paragraph 754.]

The Fordney tariff bill raised the duty of 33⅓ per cent, namely, from 3 to 4 cents per pound on almonds not shelled, and of 300 per cent, namely, from 4 to 12 cents per pound, on shelled almonds.

While almonds may be classed by some as a luxury, they in fact represent a very valuable food product. They are a nutritious and healthy food. Those imported in the shell find their utility for household use, while the shelled supply the bakery and confectionery trade. During the past few years, when prices soared considerably, the demand was greatly curtailed, showing conclusively that this article can not stand more than a reasonable impost. Any considerable increase in the price of almonds can not fail to do immeasurable damage to their consumption. The California crop has grown to considerable proportions, the 1919 crop, which was the largest ever recorded, being estimated at 7,250 tons. This is ample proof that domestic production is sufficiently protected by the present tariff rates, which have in no way retarded the development of this industry in that State. In the same year 1919–20 importations of almonds unshelled amounted to only 3,700 tons, while that of the shelled amounted to over 13,000 tons.

While the importation has shown increase, it has been gradual, especially in unshelled almonds. The shelled has shown the most striking increase, having doubled since 1913. The reason for this is that shelled nuts are not an industry here, and the trade which it supplies, the bakery and confectionery, have shown tremendous expansion during that period.

The more rapid increase in the demand of California unshelled almonds as compared with the imported shows conclusively that the California production has little to fear from the competition of the imported. The present duty of 3 cents a pound represents about one-fifth of the value, and it is amply sufficient to cover any protection.

As to the relative cost of production here and abroad, there is no widespread differ-nce. Almonds, being an arboreal crop, do not require the amount of manual labor ecessary to field crops. In this country there is the special advantage that whatever ibor is required, such as tillage and spraying, is performed by labor-saving machinery. he orchards in California, being but comparatively recently planted, have the dvantage of the higher unitary yield of trees in the prime of life. Further, of the eater economy in the cost of production, through scientific planting and proper care cultivation.

The alleged unproportion of the duty between shelled and unshelled almonds is stified by the reason that the shelled are to a great extent a raw material necessary one of the largest and most thriving American industries, the candy trade. While e unshelled may compete with the foreign for the choice of the housewife, there is o fear of competition to domestic production from imported shelled almonds.

In conclusion this chamber earnestly recommends that if it is not possible to main-ain the present rates of 3 cents per pound on unshelled and 4 cents per pound on elled almonds, which have worked well both for revenue and protection, no higher uties be enacted than 4 cents per pound on almonds with the shell and 6 cents per ound on the shelled.

MACARONI, VERMICELLI, AND ALL SIMILAR PREPARATIONS.

[Paragraph 726.]

The Fordney tariff bill proposes a duty of 1½ cents per pound on macaroni and milar preparations. This chamber desires to submit to your honorable committee e following evidence, showing that this duty is ample for the purpose of protection d most advisable for revenue.

In this endeavor it is necessary to survey the conditions of the macaroni trade, garding both importation and production in this country, as they were before and uring the war, and as they are now.

The industry of alimentary pastes, which is one of the oldest and most important of aly, had greatly developed prior to the war, especially in the districts of Genoa and aples, which enjoy a traditional reputation in this trade. The export trade of alian macaroni had reached in 1913 a total of 156,000,000 pounds equal to 7,099,000 xes, 5,000,000 boxes alone being shipped to the United States.

From the outbreak of the war Italy ceased to be a factor, as far as the export of acaroni is concerned, owing to the embargo placed on this essential article of food. eprived of this source of supply, the American market was left entirely to the dis-sition of the domestic producers. To their credit it must be said that they have ken freely advantage of this opportunity. Aside from the increased production, e to the stimulus of necessity, they vastly improved the quality of their product. Excellent macaroni is made to-day in this country, and while the imported macaroni ould still enjoy a preference with many, there is really no great difference in their mparative intrinsic quality. Of course, advantages of ages of experience, of natural d climatic conditions, of water, etc., can not be easily overcome, and in the last alysis the perfection attained by the Italian product, when made entirely of semola, ill ever enjoy the advantage that always goes to an article admittedly known as riginal" or "genuine." In conclusion, however, we do not think that some of e best brands of domestic macaroni will suffer much in comparison with the im-rted. At any rate not at the present time, when the imported macaroni is manu-ctured with only 75 per cent semola, while the domestic is made entirely of semola. We speak particularly of the future. For the present the home producers need ve no fear of foreign competition. It is impossible, under present conditions, for aly to again become a factor in this market. In the first place Italy has suffered eat hardships during the war, and is still suffering to-day from lack of wheat. She oduced less than two-thirds of her own wants of this staple, and the balance she s to import, at enormous sacrifices, mostly from this country. These sacrifices e made especially acute at present, due to the disparity of her money, and on the rizon nothing has as yet appeared that might ameliorate these conditions. How s to be expected that Italy can buy wheat in the United States, bring it to Italy, d return it to us manufactured into macaroni at a price that will compete with mestic production? For, besides the disadvantages of the money exchange and e added freight, which increased since the war from four to five times, it must be knowledged that the cost of manufacture has greatly advanced in Italy from the ewar period. Wages have advanced many times over. All materials used, as ll as the cost of the upkeep of properties and plants, show a corresponding increase, t at the Italian macaroni manufacturer to-day is working under multiple disad-ntages in the difficulty of obtaining and in the augmented cost of wheat, in the hanced cost of labor and in higher overhead expenses.

What further proof is needed that she can not become a factor than the significant fact that the export of macaroni from Italy, against a corresponding import of wheat has now been permitted for some time, and during this period but a few trifling shipments have arrived in this country, and these were offered, on the average, at a figure 50 to 60 cents per box higher than the domestic?

We feel justified in stating that macaroni can to-day be produced cheaper in the United States than in Italy.

A few figures will clearly demonstrate this fact, together with the absolute impossibility for Italian paste to compete with the domestic product. Italian macaroni is offered to-day at 52.50 lire per box of 22 pounds f. o. b. loading port, which at the rate of exchange of say 25 lire, is equivalent to $2.10 per box. Adding for freight 16 cents, insurance 2 cents, duty, at 1 cent per pound, 22 cents, we have a total cost of imported macaroni of $2.50 per box, delivered in New York.

Domestic macaroni, selling to-day at the rate of $1.70 per box of 20 pounds, namely at an equivalent of $1.87 per box of 22 pounds, shows an advantage in price of something like 63 cents, thus proving that the present duty is amply protective for domestic manufacture.

It should be noted further that domestic macaroni, manufactured as it is with all semola, has an easy advantage at present over the imported, not only in the price but also in the quality, which for the time being is better in the case of the domestic article.

When the foreign macaroni shall again be made with 100 per cent semola, its cost will necessarily increase in proportion, thus showing even a greater disadvantage in comparison with the domestic article from the standpoint of competition, which will be entirely out of question.

In prewar days, such as in fiscal year 1914, imported macaroni sold in New York from $1.35 to $1.45 per box of 22 pounds, against 77 cents to $1.10 for the domestic product. These prices show that even before the war domestic paste had the advantage of [illegible] cent per pound in the price, which we believe ample protection for such an essential article of food as macaroni. Long before that time the domestic macaroni industry had experienced conditions favorable to a substantial development, later realized to a far greater extent under the stimulus of war conditions.

The domestic manufacturer is to-day practically master of the supply of this article to American consumers, and not only in absolute control of the market of this country but also on the way to become a formidable factor of competition against foreign manufacturers in the export trade, a rôle this with which it was not identified before the war.

Many are the new and large factories that have come into existence since the war besides those that were already doing a prosperous business before. Domestic production has increased enormously, and has firmly gained the patronage of customers formerly using foreign macaroni, and domestic manufacturers are more than able to maintain and further develop this important trade.

It is very problematical, therefore, whether, even when the Russian granaries shall have opened again to foreign manufacturers—and God knows how far that may be—they will again be able to recover a part of the position they formerly held on this market, and this because of the many disadvantages that they have to overcome which practically excludes such possibility.

As before stated, Italian macaroni is not likely to ever attain the important part once enjoyed in our market. We therefore believe that the duty should be [illegible] to provide revenue without discouraging or prohibiting entirely the importation; it would be absolutely unfair to prevent certain elements with a preferred taste for the imported article from satisfying their wants or to further encumber an industry that has already suffered so much from the dire consequences of war.

This chamber is firmly convinced that any addition to the proposed rate of 1½ cents per pound would be an added burden that the imported macaroni, already [illegible] handicapped, could not endure, and which is entirely unnecessary for the purpose of protection and unadvisable for revenue.

This chamber would consider unjust that a trade built up after many years of [illegible] work, and which has already suffered greatly through force of war circumstances, should be further discriminated against.

Sentiment, we appreciate, has no place in tariff making, but who amongst us will not regret the passing of real Italian spaghetti, the pioneers who introduced to us [illegible] table delight?

This chamber therefore most respectfully recommends that the duty on macaroni be continued at its present rate of 1 cent per pound or that, if an increase is [illegible]voidable, it be not raised more than at 1½ cents per pound, as proposed by the Fordney tariff bill.

CATTLE.

[Paragraph 701.]

STATEMENT OF J. A. HAPPER, EL PASO, TEX., REPRESENTING AMERICAN CATTLE GROWERS OF MEXICO.

Senator LA FOLLETTE. What is your name and address?

Mr. HAPPER. J. A. Happer, El Paso, Tex. I also represent Mr. Packard, who could not get here in time. He wired me to represent him. Mr. Sheahan was here this morning, but had to leave.

I have been asked to present this matter in a written statement of one page, addressed to you gentlemen, which is as follows:

We represent the Association of American Cattle Growers of Mexico, that owns approximately 8,512,000 acres of land in Mexico, valued conservatively at $2 per acre, amounting to $17,024,000; also 95,000 head of stock cattle, valued at $25 per head, amounting to $2,375,000; the total investment being $19,399,000.

We desire to present to your committee some figures and statements wherein we hope to show that it is to the interest of the people of the entire country, as well as to the interest of the cattle producers, that stock cattle under 2 years of age should come in duty free.

According to the United States Census in 1900, there were 50,583,777 head of beef cattle in the United States, and according to the census of 1920 there were only 35,424,458, a shrinkage of 15,159,319.

Senator SMOOT. For whom do you speak?

Mr. HAPPER. For the American Cattle Growers of Mexico.

In the same period of time the population of the United States increased from 77,256,630 in 1900 to 107,436,441 in 1920 (Stat. Abs. U. S., p. 32), an increase of 30,177,811. Should this shrinkage continue in the next 20 years at the same ratio, it is easy to see that beef for people in moderate circumstances will be exceedingly expensive and scarce.

We quote the following from The Producer, the official organ of the American National Livestock Association (p. 10, vol. 111, No. 1, June, 1921):

"That there has been a great shrinkage in the number of beef cattle is abundantly proved by the census figures, and is fully corroborated by the depleted ranges of the West. This shortage should become more evident later in the year. Undoubtedly there will be some liquidations in dairy cattle on account of unprofitable prices for dairy products, and this will to some extent increase the meat supply. But, on the whole, prospects for the beef producer seem brighter than for some time. For several years he has been confronted with a buyer's market. Now the situation promises a change, and the seller should hold the whip hand."

In the spring of this year the Secretary of the Treasury found the condition of the cattle industry in such a precarious condition that, after consultation with cattlemen, bankers, and Treasury officials, he arranged with various bankers in the United States for a fund of $50,000,000 to be loaned to cattle raisers on long time, to save this industry.

The stock cattle under 2 years of age that have come into this country in recent years—or that will come into the country in the future—all go to pastures or feed lots to be finished for our beef markets and consume the surplus farm products of this country.

Gentlemen, I just want to add this, that for the last five years they have had droughts in what we call the stock ranges in the West. They have come intermittently in the Southwest and in the Northwest. When we had a drought in the Southwest they might have grass in the Northwest, and vice versa. But the ranges in our part of the country are depleted. We want the chance, when the ranges are such that we can not raise stock cattle for feeding, to move them back and forth across the lines, or to import them from Mexico or Canada or wherever it is necessary.

The importations of stock cattle for this purpose are infinitesimal to what is used in this country for different purposes, and we believe that if younger cattle can be brought into this country without a duty, these cattle under 2 years of age—we do not mean beef cattle—it will be not only to the advantage of the people of the entire country, but to the stockmen themselves in the West.

If there are any questions that I can answer I would be very glad.

Senator SMOOT. There are not very many that would come over from Mexico, are there?

Mr. HAPPER. Very few; very few from Mexico and not very many from Canada of stock cattle.

Senator SMOOT. I mean, those less than 2 years of age.

Mr. HAPPER. Less than 2 years old I am speaking of. That is all we ask with reference to.

Senator SMOOT. There would not be very many that would come in, anyhow, would there?

Mr. HAPPER. No; not many.

(The witness submitted the following statement:)

STATEMENT OF CHARLES E. WISWALL, CANANEA, SONORA, MEXICO, REPRESENTING THE CANANEA CATTLE CO.

The CHAIRMAN. Where do you reside?

Mr. WISWALL. Cananea, Sonora, Mexico.

The CHAIRMAN. What is your occupation?

Mr. WISWALL. I am a cattle raiser.

The CHAIRMAN. Are you an American citizen?

Mr. WISWALL. Yes, sir; my family lives in California.

The CHAIRMAN. On what point do you want to speak?

Mr. WISWALL. I want to speak on the tariff on live cattle.

The CHAIRMAN. And advocate a higher duty or lower duty?

Mr. WISWALL. I want to try to get a lower duty on some classes of attle.

The CHAIRMAN. What State do you come from originally?

Mr. WISWALL. I am a native of Illinois; I vote in Arizona.

The CHAIRMAN. How long have you been residing in Mexico?

Mr. WISWALL. I have been residing there 20 years.

The CHAIRMAN. You run a large business there, do you?

Mr. WISWALL. Yes, sir.

The CHAIRMAN. Is it a corporation?

Mr. WISWALL. Yes, sir.

The CHAIRMAN. What is the name of the corporation?

Mr. WISWALL. Cananea Cattle Co.

The CHAIRMAN. You are the superintendent?

Mr. WISWALL. I am the manager.

The CHAIRMAN. Do you own much of an interest in the company s well?

Mr. WISWALL. It belongs exclusively to my wife and her children, ny stepchildren.

Senator WATSON. Do you vote in the United States?

Mr. WISWALL. I vote in Arizona. That was my last residence in he United States.

Senator SMOOT. How much land do you own in Mexico?

Mr. WISWALL. We own 425,000 acres.

The CHAIRMAN. Do you live there all the year around?

Mr. WISWALL. Practically, Senator; I am there probably 75 per ent of the time.

Senator SMOOT. How many head of cattle have you?

Mr. WISWALL. Thirty-five thousand.

Senator SMOOT. And where is your market?

Mr. WISWALL. All over the United States, principally in the orthwestern States; also in California to a large extent.

Senator SMOOT. Feeders?

Mr. WISWALL. Feeders, practically exclusively.

The CHAIRMAN. Proceed.

Mr. WISWALL. I also represent, as vice president, the Association f American Cattlemen of Mexico. There are not very many of us ft. Our association consists of about 25 men. We have lots of and and not very many cattle. The ownership represents, I believe, bout 8,500,000 acres and only 95,000 head of cattle.

The CHAIRMAN. Do they own these lands outright or only grazing rivileges?

Mr. WISWALL. They own them outright, sir. But the lands aturally are capable of carrying many more cattle than they do at he present time. I have also told you whom I represent personally. We have been importing cattle into the United States for the last 0 years. You will recall that under the Dingley and Payne-Aldrich ariff laws cattle were dutiable, under 1 year of age at $2 per head; attle up to a valuation of $14 per head paid $3.75 per head and over valuation of $14 per head paid 27.5 per cent ad valorem. We ncountered two difficulties in the application of this law. In the rst place, there is absolutely no way in the world of telling when a alf is 12 months of age. A well-grown calf 11 months old is larger

than a 13 months old calf which has not done well, and you can see how that may lead to many questions.

The second difficulty was in applying the ad valorem rate of duty when cattle were valued at over $14 per head. We had great difficulty in arriving ofttimes at the valuations with the customhouse officers. You can readily understand how one bunch of cattle will be thin in flesh, and have poor breeding, while another bunch of cattle of the same age will be of good quality and of good flesh, and there was no way of arriving definitely at the value. We were entirely at the mercy of the customhouse appraisers, who often were not experienced cattlemen. Our bills of sale were considered valueless because very frequently unscrupulous cattle buyers would come in there and make out false bills of sale; and the result was it was necessarily unsatisfactory both to the importers and to the customhouse officers alike.

Therefore, we were very much relieved when cattle went on the free list in 1913. The importations of cattle while on the free list—that was a period of seven and one-half years, as you know—more than doubled. During the last seven and one-half years they have averaged about 500,000 head annually. Cattle importations from Mexico jumped to 625,000 head in the year 1914. That was the year after cattle went on the free list. This was not because cattle were allowed to come in duty free, but because of revolutionary conditions in Mexico, and everybody owning cattle there was trying to get them out in that year.

The Canadian importations, which amounted to practically nothing up to the time cattle went on the free list, commenced to jump very rapidly, 28,000 being imported in 1913, and it increased to 550,000 in 1919. They were off again last year, however, to 316,000 head. As you know, the emergency tariff bill went into effect on the 28th day of May of this year. This bill had the effect of practically cutting off all importations from Mexico. The Canadian importations are off about 75 per cent. I talk now of the months from June to September of this year. I was not able to get any data regarding October.

To show you how Mexico importations have fallen off, there have been but three entries of cattle from Mexico since the emergency bill went into effect—one in June of 1,010 head, one in August of 34 head, and one in September of 327 head, a total of 1,371 head.

We made the importation of the 1,010 head in June, and I would like to give you the results of it. These were yearling steers. We received $19 per head for these yearling steers on the cars at Hereford, Ariz. We paid $3.50 per head export duty to the Mexican Government; we paid $3.90 per head import duty to the American Government, a total of $7.40 per head in duties, which left $11.60 a head for the steers. This was exactly the same class of cattle which we sold 12 months previously at $42.50 per head to Denver parties, and after paying $3.50 to the Mexican Government it left us $39 per head net for our cattle instead of $11.60 this year.

Senator SMOOT. You are no worse off than cattle raisers in America.

Mr. WISWALL. I am not making any complaints; I am just telling facts; I am not telling any hard-luck story. You can readily appreciate that we can not raise yearlings for $11.60.

Senator SIMMONS. What was the highest price you got for yearings any year?

Mr. WISWALL. $42.50. We contracted sales in 1920 at $45; but ıoney conditions got very bad in the spring of 1920, and the party who contracted them fell down on the contract.

In 1911, which was the first year I was managing this outfit, and or the first sale of yearling steers I made we received $20 for our earlings. They increased in price from year to year; never went ack until 1920, when the contract price was $45, and they went ack in one year from $45 to $19.

Senator SIMMONS. What were you getting for that same class of earlings before the war?

Mr. WISWALL. In 1914, for instance?

Senator SIMMONS. No; take 1912 and 1913.

Mr. WISWALL. I will tell you, Senator. In 1911 we got $20, and ıey increased at just about the rate of $2.50 a year. In 1914 they ere stationary; it was a very bad year all over the country.

Senator SIMMONS. What did you get that year?

Mr. WISWALL. My recollection is that we got $27.50.

Senator SIMMONS. In 1912 what did you get?

Mr. WISWALL. $22.50.

Senator SIMMONS. And $20 in 1911?

Mr. WISWALL. Yes, sir. As you know, the bill that you are now nsidering calls for a duty of 1 cent per pound on cattle under 2 ars and 1¼ cents per pound on cattle over 2 years of age. The quest that we want to make is this: That you reduce the duty on e young cattle under 2 years of age.

Senator SMOOT. To what?

Mr. WISWALL. We would like to get them in free, if possible; any duction will be welcome, of course.

Senator SIMMONS. How many cattle are there coming into this untry from Mexico and Canada since 1911 and 1912?

Mr. WISWALL. How many came in?

Senator SIMMONS. From Mexico and Canada?

Mr. WISWALL. In 1911, Senator? In 1910 there were 5,000 from nada. What there were from Mexico I can give you in just one oment. In 1911 there were 182,000 head of cattle imported into e United States.

Senator SIMMONS. How many from Mexico?

Senator SMOOT. Nearly all of them.

Mr. WISWALL. Probably nearly all of them.

Senator SIMMONS. Five thousand from Canada?

Mr. WISWALL. In 1910; yes, sir.

Senator SMOOT. In 1910, 1911, and 1912 Canada was shipping all her stock, nearly, to Great Britain.

Senator SIMMONS. In 1911, you say, we got 5,000 from Canada, d how many from Mexico?

Mr. WISWALL. About 182,000.

Senator SIMMONS. When normal conditions return, we will say, you anticipate that exportations from Canada and from Mexico ll be larger than they were before the war?

Mr. WISWALL. From Mexico it is an impossibility, because Mexico depleted of cattle.

Senator SIMMONS. That is what I want to get at.

Mr. WISWALL. Canada has more cattle than she had 10 years ago, probably 50 per cent more.

Senator SIMMONS. Then, your opinion is that we need not anticipate a much larger importation of cattle from Mexico in the immediate future than we received just before the war?

Mr. WISWALL. It is impossible that we should receive them.

Senator SIMMONS. I want to ask you what effect, in your opinion, does the importation of 180,000 cattle from Mexico have upon the price of cattle in the United States, if any?

Mr. WISWALL. Senator, people would say that I am prejudiced, because I am in business in Mexico.

Senator SIMMONS. I am asking your frank opinion, and I will accept it as a frank and candid statement, if you will give it to me.

Mr. WISWALL. There are about 13,000,000 head of cattle marketed in the United States annually. What effect would 160,000 have on 13,000,000? I do not think it would be felt. But, as I say, people would say that I am prejudiced, and probably I am, because I am in business in Mexico.

I want to explain briefly, if I may, why we ask for one rate on cattle under 2 years and another upon cattle over 2 years. In the first place, 2 years of age is an age we can arrive at absolutely in a cow or steer. When a calf commences to shed its milk teeth, or first-growth teeth, it is about 22 months old; and when it gets to be 24 months old it has two large second-growth teeth in place in the middle of its lower jaw. So that by examination of an animal's mouth, which can be done in a moment, there is absolutely no question whether it is under or over 2 years of age. That is one important reason why there should be that division at the age of 2 years.

The other is that practically all of the cattle which are imported into the United States which are under 2 years of age, with the exception of a very few which come in from eastern Canada, are stockers or feeders; that is, all the cattle from Mexico coming into the United States go to grass. Most of our cattle go to the Northwest—Montana, Wyoming, and Colorado—where they are put on grass and fed out and marketed as grass-fat cattle at the age of 4 years. That is not true of Canadian cattle, although I am not as familiar with Canadian as I am with Mexican conditions.

Senator SIMMONS. Let me ask you another question. You say you sold your steers this year for $11?

Mr. WISWALL. Yes, sir.

Senator SIMMONS. What did you have to pay for beef cattle, getting them ready for the market, to send them over here to be fed?

Mr. WISWALL. We sold them to people to be grazed by them.

Senator SIMMONS. Do not people sometimes send cattle to a ranch and pay for their feed?

Mr. WISWALL. Yes, sir; we have done that ourselves.

Senator SIMMONS. How much would be paid in the way of cost of feed under such circumstances?

Mr. WISWALL. We ran 3,500 steers on the Rosebud Indian Reservation, in South Dakota, for three years. We paid 50 cents per head per month for the grazing. That was in 1918, 1919, and 1920. The price was very excessive.

Senator SIMMONS. How many months did you have them on the grass?

Mr. WISWALL. About 30 months, or a little over 30 months.

Senator SIMMONS. Why did you have to keep them on the grass that long?

Mr. WISWALL. We had to keep them until they were 4 years of age. An animal fed on grass does not mature until it is 4 years of age.

Senator SIMMONS. They were sent there when they were what age?

Mr. WISWALL. Yearlings, or 2-year-olds.

Senator SIMMONS. And you paid 50 cents a head?

Mr. WISWALL. That was a very small part of the expense. We had the wages of our men and the interest on the money, borrowed to carry them on, to pay.

Senator SIMMONS. I understood you to say that you paid 50 cents a month for grazing.

Mr. WISWALL. Yes, sir.

Senator SIMMONS. And there were how many months' grazing?

Mr. WISWALL. We moved our cattle to Dakota in May, 1918, and sold them in November, 1920, 30 months.

Senator SIMMONS. Did you have any other expense connected with the cattle after you sent them over here?

Mr. WISWALL. A great deal of expense.

Senator SIMMONS. You had to look after them?

Mr. WISWALL. Yes, sir.

Senator SIMMONS. That was just for the privilege of grazing and feeding?

Mr. WISWALL. Yes, sir.

Senator SIMMONS. You had to attend to the cattle?

Mr. WISWALL. Yes, sir.

Senator SIMMONS. So that the amount per head that was spent in this country after the cattle arrived here was about one-half of what you got for them, was it not?

Mr. WISWALL. In this particular case, unfortunately, it proved to be more than we got for them. I was giving our reasons for asking that cattle under 2 years of age be put in one class and those over 2 years of age in another class, stating, as the principal reason, because we were definitely able to arrive at the age of 2 years and, next, because practically all cattle under 2 years of age which are brought into this country, with the exception of a very few which come in from eastern Canada, are stocker or feeder cattle; that is, our cattle go to the West and Northwest to be put on the grass and kept there from one to three years, the Canadian cattle, many of them, going direct to the feed lots. Of course, they are larger cattle than Mexican cattle and in almost all cases better bred cattle. But I appreciate the fact that that is not reason enough for asking that the rate on young cattle be reduced. Our basic reason for making this request is because we believe that there is no overproduction in the United States to-day, and we also believe that there is no large number of cattle, even in Mexico or Canada, which would be thrown on the market if young cattle were put on the free list. I fully appreciate the fact that many people will disagree with me—American cattlemen.

Senator JONES. What is it that makes you believe there is no overproduction of young cattle in the United States to-day?

Mr. WISWALL. I will give you my figures, in just a moment, Senator.

Senator JONES. All right.

Mr. WISWALL. I think you gentlemen who were here at the hearing Thursday will recall the three gentlemen—Mr. Cowan, of the American Cattle Raisers' Association, and Mr. Spiller, of the Texas Southwestern Cattle Raisers' Association, and Mr. Mercer, from Kansas. I do not recall who Mr. Mercer represented, but I think Mr. Mercer's remarks are typical of the remarks which I have heard in meetings of cattle growers' associations all over the country. Mr. Mercer made the statement before you, in asking for protection, that in two years there would probably be, if present conditions continue, an actual scarcity of cattle in this country. Within a few minutes he made the statement that he thought at present the cattle industry in the United States was producing enough cattle to supply the wants of the country. When American cattlemen are seeking financial aid from the Federal Government, they usually give the impression that the industry is on its last legs. Here is a clipping which comes from the Los Angeles Herald of October 2, which gives the impression that Eugene Meyer got on his trip through the country. This is dated Washington, October 1. [Reading:]

"A serious cattle shortage will confront the United States within a year unless live stock raisers stop the flood of immature cattle to the slaughterhouses," Eugene Meyer, head of the War Finance Corporation, said to-day.

Meyer returned to-day from a tour of the cattle-raising country in the West and Middle West.

Here is an article showing the way the cattlemen talk who think there is no shortage of cattle or that the shortage is not serious. This is from the "Producer," the official publication of the American National Livestock Association. It is from page 7 of the October number, by D. A. Millett, of Denver, Colo.:

It is true that the western range country shows some depletion in cattle population; but when the fact is faced that, according to the 1920 census, the State of Iowa had about as many cattle of all classes on January 1, 1920, as the States of Montana, Wyoming, Nevada, Arizona, and New Mexico combined, the real importance of the so-called range States shrinks in comparison.

That statement was pretty well answered on page 11 of the same magazine. I will be very brief. [Reading:]

"The marketing of western cattle," by A. Sykes, president of the Corn Belt Meat Producers' Association.

Mr. Sykes goes on to say that—

The only fairly complete figures as to live-stock shipments by States are those compiled by the Bureau of Markets for the year 1918. Eliminating the three Pacific States, these figures show that in that year some 353,000 cars of cattle and calves were loaded in the 14 States, out of a total for the entire country of 623,000 cars. The 1920 census figures show much the same thing.

So from that it would look, after all, as if the range States in the country were a pretty important factor in the production of cattle. I think you have all seen, a great many times over, statements that the Northwestern States of the country are depleted of cattle; that is, the ranges of Wyoming, Montana, and Western South Dakota. When I came through Chicago last week I went out to the sto

ırds a short time to see if I could get some figures on the receipts western range cattle at Chicago for this year compared with other ars.

I also secured the figures from Omaha. Omaha and Chicago are e two principal markets for western range cattle. Of course, oux City and St. Joseph and St. Paul are also markets for western ttle, but Chicago and Omaha are the principal markets.

The receipts this year for the first 10 months, to November 1 this year, were 75 per cent of what they were last year, and were per cent of what they were in 1919. It is only fair to say that 1919, on account of the drought in the Northwest, there was a emendous movement of cattle to Chicago and Omaha. While ceipts were 38 per cent of 1919, they were 47 per cent of 1918. ıt, at any rate, it all goes to show that there has been a tremendous luction of cattle in the Northwest.

Senator WATSON. Statistics of imports into the United States mbered 294,207, mostly from Canada and England. Were they ders or beef cattle?

Mr. WISWALL. From what I have found out, Senator, in looking er the figures that are available—I was going to come to this later, t I will answer your question now—about 50 per cent of the cattle ich have been coming from Canada for the last two years are beef ttle for immediate slaughter. At one time, I am told, when Canada mmenced to import cattle into the United States, they were all beef tle. But the high prices during the war and the tremendous nand for cattle caused Canadian cattlemen to jar loose of some of younger stock, and the figures I got were these: Fifty per cent f cattle, 25 per cent calves. Of course, it means calves for immete slaughter, and I expect a great many were dairy calves; and 25 cent stockers and feeders. Those were figures I got from Canan sources.

From Mexico I can only give you—there is no classification—what import ourselves, taking that as a basis. Our importations have raged for the last 10 years over 10,000 head of cattle annually; out 33⅓ per cent of these cattle were stockers under 2 years of ; and about 20 per cent were beef cattle that went to Los Angeles; ance stockers, feeders, and canners over 2 years of age.

I started to say that, perhaps, the strongest argument that I can e you is the census figures for 1920. I do not like to burden you h them, because we have heard them many times.

Senator CURTIS. We wish you would leave those figures out, and ı can call our attention to them, because the committee has a at deal to do, and we have those figures all before us in the tables e.

Senator WATSON. You can file your brief.

Mr. WISWALL. There are 32 head of beef cattle in the United tes to-day for each 100 inhabitants, compared with 45 per 100 abitants in 1910 and 65 per 100 inhabitants in 1900. I think that ibout the very strongest argument we could make in our behalf. eadily understand that while my figures may be admitted as cort the American cattlemen of the United States will naturally say cattle market is so badly demoralized that we should not allow importation of one head more to further demoralize the market.

If there was an overproduction, I think this argument would b sound, but as there is no overproduction and as there is no prospec of any large surplus of cattle coming into the market from a outside source, I think we ought to look into the reason for the presen demoralization in the cattle market. I can definitely say, withou danger of being contradicted, I believe, it is caused by overborrowin during the bonanza years in the cattle industry, which has cause forced liquidation at the present time.

The time of the starting of this liquidation can be definitely locate It was in the fall of 1919. There was a tremendous drought Montana, Wyoming, and the western Dakotas in the summer of 19 Cattlemen there found in the fall that they either had to go to mark with their cattle or they had to ship south to pastures—to Texas, Ne Mexico, and Arizona—or they had to buy expensive feed to carry the through the winter. The result was that a great many of them we to market. You can see that three times as many cattle went market in 1919 as in the present year. As a result, you all know th the cattle market broke badly, as it always will when cattle are s to market that should not be sold, and that liquidation has co tinued from that date to this very minute. It is still going on in t western markets. You know the situation in the spring of 1920.

I have to say that it was an absolute impossibility for northweste cattlemen to borrow money to buy stockers and feeders in t Southwest. In the fall of 1920 bankers were thoroughly frightene as they saw the value of their collateral depreciated, and insisted cattle being sold, and in the fall of 1920 there was just such anoth condition as in the fall of 1919, and this fall exactly the same th occurred again. I think an example of how our cattle sold the l four years will show you just how the market has gone.

In 1918 our cattle coming to Chicago sold at 15 cents per pou in 1919, when there was a tremendous run, they brought 11 cents Omaha; in 1920, when the market was weak because the bank were forcing liquidation, they brought 9 cents a pound in Oma and this fall those same cattle were bringing 5½ cents and 5¾ cent pound in Omaha, where they brought 15 cents in 1918.

I think it will be admitted that forced liquidation is the cause the cattlemen's trouble at the present time; but I do not thin have said anything to show you why bringing in more cattle wo not further demoralize the markets. My idea is this: The rea that it would not further demoralize the cattle market is that cattle, stockers and feeders, do not go direct to those markets, wh there is open trading from day to day and where really cattle pr are fixed. On the other hand, cattle buyers come down to our pl ride around the pastures, see the cattle, and if they are satisfied trade with them. Those cattle are shipped direct from our shipp point to pastures for which they are intended. In that way they not pass through any of the principal markets.

I do not want to say they do not pass through any of those mark because they do go through El Paso and Denver to the Northw and frequently a man will go to the Southwest and buy steers possibly be able to turn them at a profit in Denver and do so, then go back and buy more cattle. That happens frequently. they do not go with the idea of throwing them on the open mar

Senator JONES. Tell us, please, about the prices of the cattle that ave not gone onto the market that you speak of. Have those prices one down also?

Mr. WISWALL. Naturally, Senator.

Senator JONES. To what extent?

Mr. WISWALL. I do not think you were here when I commenced -day. I stated that we had sold our cattle this spring at $19, hereas a year ago we had sold them at $42.50, speaking of yearling eers.

Senator JONES. You have mentioned as controlling factors, in der to substantiate your position that there is no overproduction cattle in this country, only two things, if I have been able to llow your testimony correctly. Those two are the population of e country and the number of cattle in the country. From that you gue that there is no overproduction. I will ask you if there are not me other very important factors which should be taken into nsideration?

Mr. WISWALL. I mentioned, Senator, the receipts of western range ttle at Chicago and Omaha so far this year as compared with other ars; that indicates——

Senator JONES (interposing). That indicates merely the number of ttle in the country. Are there not some other factors which are en more controlling than those you have mentioned? Overpro-ction, it seems to me, must be measured by the demand.

Mr. WISWALL. That is very true.

Senator JONES. And apparently you have left out of your equation at factor. You are assuming that there are so many people in the intry, so many cattle in the country, and therefore the demand cattle ought to be a given amount. But that does not appear to the case now.

Mr. WISWALL. No.

Senator JONES. Our 105,000,000 people will not consume in such nes as these as many cattle as 75,000,000 would under other cir-nstances, and while there may not be an overproduction of cattle normal times, is it not apparent from the low prices of cattle that re is an overproduction for the consumptive demand?

Mr. WISWALL. No; I do not agree with you there, Senator, because elieve the low prices have been caused absolutely by forced liqui-ion and by the marketing of many cattle which never should have n brought to the market.

Senator WATSON. Let me interrupt. The expert furnishes me tistics showing that we exported during the first nine months this year 161,608 head, while we imported 75,988 head, or more n two to one. That would seem to indicate that there is no at shortage. Do you know what kind of cattle those were we orted?

Mr. WISWALL. Yes, sir; they were beef cattle.

Senator JONES. And you left out the fact that we exported large ntities of meat. We export a large quantity of fresh meat, and export a large quantity of canned beef and pickled beef, and that ld indicate that we have a surplus of these products; and, reover, is not the demand for beef governed largely by the supply other meats—pork and mutton and that sort of thing—because n one class of meat gets a little high and another is low, there will a change from one to the other, and you have to take into con-

sideration the entire meat supply when you are considering th question of supply and demand of one kind of meat, it seems to me.

Mr. WISWALL. The mutton consumption in the United States i comparatively very low. I feel this way: I think that the Americ nation is a beef-eating nation. I think that when it comes back to normal we will see our beef consumption rapidly increase, much more rapidly than our production can increase. I admit that th consumption of beef is certainly much lower to-day than it has eve been before for a great many years, and it seems to be on the decrea all the time. Whether it is because of the industrial conditions al over the country, or whether it is because of advertisements to "Ea no meat and eat something else," I do not know.

Senator JONES. And will you not agree to this fact, that th price of stock cattle, such as you want to import, now being sol in the United States is less than the cost of production?

Mr. WISWALL. Yes; certainly. But I say this, Senator, that it all caused by these people having been forced to liquidate. I coul cite many instances of that.

Senator JONES. That means there is an oversupply of catt except at a very reduced price; that is what that means?

Mr. WISWALL. No; pardon me, Senator. It means this: You kno every cattleman is a borrower. There is not one in a hundred th is not a borrower; and you know that for many years the mone was offered to us instead of having to go and hunt for it, and, as a ru these cattlemen would borrow at least two-thirds as much as th cattle were worth. Cattle have fallen 50 per cent. The result that the collateral that the bankers have is not worth the amount money loaned on it, and they are simply forcing these men to se every single day of the year. They are doing it to-day; they a selling everything they can lay their hands on—young heifers an cows. You know a poor yearling simply will not bring any mone When a cattleman wants to get money for his cattle he has to go market with fat cattle.

Senator JONES. Then would not overshipment of cattle into t United States add to that demoralized condition?

Mr. WISWALL. Those cattle do not go direct to the market.

Senator JONES. But is not the stocker market just as much demo alized as the beef markets?

Mr. WISWALL. But, Senator, the people who buy stockers, f instance, young steers, do not go to Kansas City or Omaha.

Senator JONES. I know they do not, but they go to a mark They go to some buyer, and that market seems to me, if I kn anything about conditions, is just as much demoralized as the mar at Kansas City or Chicago.

Mr. WISWALL. All markets are demoralized at present.

Senator JONES. All markets are demoralized at present; a would not the importation of additional cattle from Mexico add that demoralization?

Mr. WISWALL. I think the importation is so comparatively sm that it would not be felt.

Senator WATSON. If normal times were restored in the Uni States and they reached the usual degree of prosperity, with u demand for cattle, the duty that you would be compelled to p

under this tariff would not demoralize your business and prevent your raising stockers and feeders to import into the United States?

Mr. WISWALL. We are in the cattle business and are going to stay in the cattle business.

Senator WATSON. Precisely.

Mr. WISWALL. And we have got to adjust our business to meet the conditions. If you put an impossible duty on, we have got to find a market some place else or else go broke. We are going to try to stay in the cattle business.

Senator WATSON. How long have you been in the cattle business?

Mr. WISWALL. Fourteen years.

Senator WATSON. And have not gone broke yet?

Mr. WISWALL. Not yet.

Senator WATSON. You are in luck.

Senator GOODING. You are better off than most Americans in the cattle business.

Mr. WISWALL. The advantage in Mexico which we have over those in the United States is that when we go to a bank they will not look at us; we can not borrow a nickel on our cattle in Mexico. That is what saved us.

Senator JONES. Have you gone into the question of your cost of production down there?

Mr. WISWALL. No, sir. But I will be very glad to give you any information I can on that subject.

Senator JONES. I wish you would tell us something about the finished cost of production in Mexico and in New Mexico, for instance.

Mr. WISWALL. I can only speak for myself; that is, the figures of my own company. I do not know what other people's figures are. For instance, in the year 1920 our total expenses of all kinds, including interest and rent, and operating expenses and improvements—because we charge our improvements to ranch expenses—was $240,000. We branded 14,000 calves; we gathered 12,000 yearlings this year, that is about $20 a head for our yearlings, on the Mexican side of the line.

Senator JONES. You charge improvements to expense?

Mr. WISWALL. To expense; yes, sir.

Senator JONES. And you own the land?

Mr. WISWALL. Yes, sir; we own 425,000 acres, and we lease 75,000 acres.

Senator JONES. How much rent do you pay?

Mr. WISWALL. We pay 6 cents an acre.

Senator JONES. What part of Mexico are you in?

Mr. WISWALL. Sonora, right adjoining the international line.

Senator WATSON. We have given you an unusual amount of time. I suggest that you file your brief, and we will read it.

Senator GOODING. That is Mexican money?

Mr. WISWALL. No, sir; that is American money.

I wish to add one point which perhaps I have not made clear. Our cattle are sold before they are imported into the United States. For that reason it seems to me that they can not in any way affect the price of stocker cattle in the United States.

All cattle from Mexico are handled in this way, and I am told, but have no personal knowledge, that most young stocker cattle from Canada are also handled in this way. As nearly as I can arrive at the figures, I estimate that of the 316,000 head of cattle

imported from Canada in 1920, 80,000 head were calves and 40,000 head were stockers and feeders between the ages of 1 and 2 years.

Of the 60,000 head imported from Mexico, I estimate that one-third, or 20,000 head, were under 2 years old. The exportation of calves from Mexico is prohibited by the Mexican Government. In other words, probably 60,000 head of stockers and feeders under the age of 2 years were imported into the United States in 1920.

I do not think it probable that that number would be exceeded for some years to come. There is no longer the attraction of high prices to tempt the Canadian cattleman to sell his young cattle, and the cattle industry in Mexico is at a complete standstill.

LIVE STOCK, MEATS, AND HIDES.

[Paragraphs 701–703 and 1582.]

STATEMENT OF SAMUEL H. COWAN, FORT WORTH, TEX., REPRESENTING AMERICAN LIVE STOCK ASSOCIATION.

Mr. COWAN. I live at Fort Worth and represent the American Live Stock Association.

The CHAIRMAN. The committee will be pleased to hear any additional statement you may have to add to those you so ably set forth before the House Ways and Means Committee.

Mr. COWAN. Mr. Chairman and Senators of the committee, I have many times appeared before committees of Congress, and several times before this committee and the Ways and Means Committee on this subject; and I therefore very fully appreciate the difficulties under which you labor and the difficulties which confront one trying to present the facts to the satisfaction of those whom you represent, and I am particularly conscious of the necessity of the conservation of time as much as the conservation of natural if not artificial resources. If I could handle the clocks as they have been handled in a few historic periods, I would make some time. But I can not do that.

At the outset of my remarks I wish to pay the highest compliment that it is possible for me to do to the gentleman who has just taken his seat, Prof. Rice.

I am going to submit to the stenographer here some statistical data, and the brief which we filed before the Ways and Means Committee, and to make reference to the most elaborate argument and brief I have ever prepared upon the subject, when the Payne-Aldrich bill was under consideration, and which was printed in a volume of the House committee proceedings in 1909, to which I will refer, and thus point to as complete analysis as we can make of the subject with respect particularly to the then tariff on hides. Well, I will not take so much of your time.

Referring again to the gentleman who has just closed his argument, I think he spoke in words of very great wisdom to this committee, and I wish the whole people of the United States and every man who serves the country through the political parties could hear it; could be conscious of the things he has shown here, in order to convince the people, in spite of politics, in spite of tradition, of the great necessity at this time, in particular, and it will remain so in the future, that we have our home markets preserved to our home production

here we can make a reasonable sufficiency or where we are capable producing a sufficiency.

We have been in the unfortunate position, politically speaking, of ving always believed in what I have just said. I would love to ve had the opportunity to vote for what I have just said. I did idertake to do it when I voted for President Harding in Texas, d I voted for him on that proposition. I am not tickled to death out it, and I am not bragging about it, for I wish to add my iticism, if it is worth anything, to those who profess to protect the dustries of this country and lose sight of this great fundamental sic industry, agriculture, upon which alone prosperity, indeed rilization alone, is based for the human race from nomadic nes, when learning to domesticate animals and gather their food eresoever they could at the very beginning of civilization. agriculture progressed civilization progressed, and so it is and ll be to the end of the human race; and it is amazing to me to ow that we have among us in this country men of great wisdom in her things, perhaps, who, for selfish reasons and their desire to ofit from the "industry of profiteers" that have grown up in this untry in recent years, will have the nerve to say to the Congress d to this committee that you must "place these agricultural oducts or any of them on the free list," because they, as the time-ving advocates of the consumer, say it will help the consumer. id what do they care for the consumer?

I refer particularly to the manufacturer of shoes. I say that in opinion it is demonstrated by the facts produced before the ays and Means Committee during consideration of the Payne-drich bill that they spread a propaganda throughout this country free hides, with the object of fooling the people and many poli-ians into the belief that the people would get the benefit of it in es that were produced for themselves and their children. And en to-day, or at least just recently, our own Congressman from xas voted for free hides, when 90 per cent of the people of that ate would to-day vote for a tariff, if they had a fair show, on every ricultural product of that State, and there is not a man from the ate who does not know that.

The documents to which I have made reference demonstrate yond a question that the proportion of the tariff added to the labor at goes into a pair of shoes that comes from a cowhide, or a similar le, was so small that to figure it at all in the retail price of the shoes is sally to talk about. And yet I have understood that from one of States in our southwestern country a new Member of Congress, der this recent régime, spoke in the House of Representatives in vor of having free hides, in order that the Member of Congress ght aid the people in getting cheap shoes for children who go to ool, and that in the presence of the fact that when we have free es in this country and free hides in this country we have paid the st unreasonable prices for shoes and few have been imported—5,000 pairs of shoes were imported into the United States in the ir 1921, when both shoes and hides were free. Why would any benefit by keeping that up, when my wife just the other day, out her own money—I did not have it, the Lord knows—the people o employ me, the cattlemen, are broke—paid $13, in the city of

Washington, for plain, low-quarter shoes, because we are plain people. And for these gentlemen to have the nerve to come before Congress and advocate free hides for the farmers in this country staggers the imagination. I have not the patience to argue the question.

The time has come, I wish to say to this committee, when the people in this Nation who are engaged to-day in working with horns and corns on their hands and callouses on the bottoms of their feet working 10 hours a day, for the mere chance to make a living; with their families wearing coarsest clothing and remaking their old clothes, with the repairing and use of all the agricultural implements and paying these enormous profits that are put upon them by some hook or crook—the people of this country are demanding, and they are going to have, the whole measure of protection against the profiteer of the farmer, and the producer and the live-stock producer, all of whom are working in the same line. Our country must [illegible] undeveloped; we can not even cultivate what we have, and it is a backward step for America to neglect the protection of these producers from the soil, just as certain as we live, unless you shall bring down the costs of what we buy from the manufacturer. I have to pay $180 for a wagon. When I went to Texas in 1878 [illegible] years ago, the Milburn wagon, the Studebaker wagon, the Bain wagon, and others sold and were bought for $75 each; but I paid [illegible] an ordinary wagon for one of my farms that I own, like the railroads own their property, for what I could owe on it—$180? The freight rate on that wagon is nearly as much from South Bend as the price of the wagon was then.

It is an amazing proposition that the concentrated wealth of the country, that which has been enabled to concentrate not only the wealth but the brains of the country, have always got the money to pay to present their specious arguments. . This gentleman who spoke for the producer here was the first man I have seen who had money to get up the charts and prepare to present to you these things as they ought to be presented. But when the others come here they can fill the hotels, they can fill the offices in Washington. You can not even get into an elevator without meeting a lot of them. They are on the job, they know how to do it, and they work three shifts of eight hours each a day and get paid union prices, and preach poverty prices for the farmer.

That is the reason we are here. We do not need to ask you to do your duty, because we feel that you will do it. The House committee made a grave mistake in not putting a duty on live stock and live-stock products that would protect the producer of this country in the home market. If it gives him a monopoly, it will be the first monopoly that he ever benefited from. You can not, however, give him a monopoly. Why? Because we have the soil; we have the labor; we have the climate. We will always produce so that it is absolutely impossible to have a monopoly in farm products in the United States. We ought to-day to be producing sugar that will supply this country and make us an exporter of sugar. Any other nation in the world would have done it with our climate and our opportunities. But we have been so wedded to specious arguments which have been urged, the propaganda which has been spread

amongst us, and to our politics, that we have simply played into the hands of this glut, on the theory that from him who has not shall be taken even the little he hath. I am so impatient with the whole situation that confronts our public life, with those who are controlling things in this country—and I suppose it is so all over the world—that I can scarcely believe, as I heard Frank Hegenbarth out in Washington say, that the stock raiser and the farmer can find a true friend in the city of Washington. They are growing here now; they are hearing from the country, and they are seeing the necessity; and our men, one of them a man from my own town, Fort Worth, where I reside, a city where live stock is one of the greatest businesses, voted for free hides on account of the fact that he wants cheaper shoes and was afraid to put a duty on shoes. I asked him how many shoes he thought were imported into the United States. He did not know. I said, "just enough to make one pair each for the population of Dallas during one year."

I speak these things plain, because I said to the Committee on Interstate Commerce the time has come to talk "turkey;" and that is the way I wish to impress this committee.

I mean no harm by what I say to you. I have the greatest respect for this committee and I have the greatest respect for all of the committees here in Congress. But I have no patience with the idea of refusing to give to the farmer and stock raiser of this country enough tariff protection to insure him a fair degree of preference; that will give him the preference in the markets of this country for what he produces. What are we going to do with this great western country that lies west of the corn belt? There is the intermountain country, with enough territory and land that can be irrigated to feed the United States were it necessary. Yet to-day, by reason of the freight rates, by reason of the situation that confronts the people of this country, it is going back, and it will keep going back. They need to have the benefits of the markets of this country.

This is not an ordinary case of importation, so far as meats and hides are concerned, in general commerce, because only those who bring this in are those who manufacture for exportation from the other surplus countries, just a few large packing houses can import the meat and the hides that come in in competition with the very same stuff they produce and sell for the most part in the sections of the United States which consume the surplus.

It is a question whether you will let that come in here and take the place of what they will produce here if they buy from us when we are selling steers to-day at $40 a head loss all over this western country.

I am glad we have got some eggs. I hope you will protect the eggs, because there are many instances—and this is verily true—where the stockmen who have been worth considerable money, that their families to-day are paying grocery bills from the products of the hens which the housewife is producing.

Senator CURTIS. Tell the committee what the steers cost which are now selling at $40 loss.

Mr. COWAN. Nobody will believe me, Senator.

Senator CURTIS. I know they will not, but I want you to tell, anyhow.

Mr. COWAN. Joe Mercer is going to follow me here, and he will tell you. They cost so much I am afraid to tell you.

Senator CURTIS. That is what I want to get into the record.

Mr. COWAN. The State of Kansas has gone broke because Texas has gone broke selling them cattle to fatten; that is the size of it.

Senator CURTIS. That is right.

Mr. COWAN. I want to make some remarks about some data which I want to introduce. A resolution was passed——

Senator JONES (interposing). Mr. Cowan, if you are not going to touch upon it again: You referred awhile ago to the fact that the meat packers were the ones who imported the meats into this country, and so on. Are you going into that in more detail?

Mr. COWAN. No; I just stated a fact that everybody knows.

Senator JONES. The point I would like to have you make clear, if you will, and if somebody else is not going to touch upon it—this country is a large exporter of meat?

Mr. COWAN. Only hogs, not meat.

Senator JONES. Of meat products—and it is my notion that the hog products are related to the cattle products, and we do export considerable beef products, if my information is correct.

Mr. COWAN. I will leave you the figures on that.

Senator JONES. What I wanted to get at was, if it is a fact, how they would import these beef products and mutton products so as to control the price of those products in this country. In other words to find out how the meat industry of this country, for instance, can be benefited by a tariff.

Mr. COWAN. Answering your last question, as to how it would be benefited by the tariff—it would be in this way:

We have apparently an overproduction compared to the consumption of meats, resulting from many causes, and perhaps the most prolific cause is the very high price of retail meats. The other is the very large amount of unemployment and the ceasing to buy. Unless we can export a surplus when we have it, we are in a very bad situation, as will readily be understood. The other countries—South America, Australia, and New Zealand—export their meat products to the same consuming countries to which we would export ours; the same packers, with the exception of one or two English concerns, manufacture the product in those countries to export to Europe, the same as they manufacture in this country and in Canada to export to Europe. If it turns out that our situation here is such that a better price is obtained, good business would seem to turn the stuff here; and we did witness the importation into this country of an enormous amount of frozen lamb, as you remember.

If we have a good stiff tariff here we will not be made the dumping ground for stuff the world will not take; it will be taken out, because these gentlemen are in business to sell their products. So that we are to be very greatly benefited, first, in the stability of the market and, second, in the stability of the live-stock industry. If we have a staple market our home producer will agree to give a preference in our home market.

Senator JONES. Is not the real benefit that the meat producers of this country will get from the tariff that it will tend to stabilize prices?

Mr. COWAN. Just what I said, in my opinion, after a long study of it.

The resolution I want to offer—and I will file it—was passed by the mid-year meeting of the American Live Stock Association held at Salt Lake City in August, asking for a duty on hides of 20 per cent, which we think should be ad valorem, because there are such a variety of hides, which may be trimmed, and a specific duty by the pound would not be desirable; and on live stock fixed on a basis of 20 per cent. One of the reasons is that it will force all of it to be weighed, and that would give a chance for inspection as it comes in, and it would show just what comes in, how it comes in, and would enable us, so far as Mexico is concerned, probably to prevent stealing such things. You would not pass a tariff for that, but it is desirable from every standpoint, particularly if you put it by the hide, the various values they put upon it will enable one to get an advantage over the other; whereas if you put on an ad valorem duty there is a market price pretty well established known at the time of importation, as to how much it brings on some of the near-by markets per pound.

The National Wool Growers passed their own resolution with respect to wool, and it was indorsed also by joint convention, and these resolutions were fixed—those are the latest expressions on the subject, those resolutions representing the sentiment of the live-stock men.

RESOLUTION NO. 9.—TARIFF LEGISLATION.

Whereas, the American National Live Stock Association and all other live-stock organizations of the West and South are and have continuously been in favor of a reasonable tariff on importations of live stock, meats, hides, and wool, to the end that the American live-stock industry may be accorded a fair degree of preference in the home markets; and

Whereas, the House of Representatives, by passing the tariff legislation known as the Fordney bill, has placed hides on the free list, and has failed to impose a sufficient duty on live stock, meats, and wool to give to American producers such a degree of preference; and

Whereas, it is the right of the live-stock interests that this be corrected and that a duty sufficient for the purpose be placed on such products: Now, therefore, be it

Resolved, by the American National Live Stock Association, at its mid-year meeting in Salt Lake City, Utah, August 26–27, 1921, That we demand—

1. That hides be put upon the dutiable list with a 20 per cent ad valorem duty.
2. That the duty on live stock be fixed on the basis of 20 per cent ad valorem.
3. That the duty on fresh and prepared meats be placed at 20 per cent ad valorem, subject to a minimum of 4 cents a pound.
4. That the duty on wool be placed at the amount demanded by the National Wool Growers' Association, whose position on that subject we hereby indorse; and be it further

Resolved, That it is the sense of this convention that many Congressmen have been misled by specious arguments of shoe and leather concerns to the effect that free hides mean cheaper shoes, which arguments have been abundantly refuted by our experiences under a free-hide policy, with no importations of shoes; and that we call upon stockmen generally to demand of their Congressmen active support of a reasonable duty on these commodities; and be it further

Resolved, That this association take active steps to present arguments to the congressional committees in support of this resolution.

I wish to offer in this connection certain documents. The brief which I filed before the Ways and Means Committee on December 6, 1908, is in my statement there; I wish to offer that brief here. My statement is available in those prints, if desired. The brief

covers the subject so thoroughly that I would like to have it in here, as it has never been printed by this committee.

The CHAIRMAN. Is that brief, Mr. Cowan, a voluminous document?

Mr. COWAN. It is rather voluminous.

Senator CURTIS. It was printed in the House hearings?

The CHAIRMAN. Do you want it printed here?

Mr. COWAN. No; just to have it available.

The CHAIRMAN. I understood you wanted it printed.

Senator LA FOLLETTE. It is difficult to get copies of those old hearings now.

The CHAIRMAN. I am entirely willing to have it printed.

Senator LA FOLLETTE. I would suggest that it be printed so that it will be here with the rest of this new matter.

The CHAIRMAN. I will agree and Mr. Cowan will agree that we do not want to cumber up the record with material that will crowd out the really good matter. If you want it printed, we will print it. If you are satisfied with the printings in the House hearings, we will let it go at that.

Mr. COWAN. It is the old hearing—1908.

The CHAIRMAN. The document will be printed.

Mr. COWAN. The principle and the method of analyses with respect to the extent which the tariff on hides would enter into shoes is also set forth.

BRIEF OF S. H. COWAN, FORT WORTH, TEX., REPRESENTING THE AMERICAN NATIONAL LIVE STOCK ASSOCIATION AND THE CATTLE RAISERS' ASSOCIATION OF TEXAS.

WASHINGTON, D. C., *December 5, 1908.*

COMMITTEE ON WAYS AND MEANS,
Washington, D. C.

GENTLEMEN: The American National Live Stock Association is composed of stockmen and associations of stockmen in cattle raising and feeding business in States west of the Mississippi River.

The Cattle Raisers' Association of Texas is composed of cattle raisers throughout the Southwest, in Texas, and the trans-Missouri States and Territories.

We oppose placing hides on the free list. We demand equality of opportunity.

It is singular that so many makers and manufacturers of leather should behtr themselves to get cattle hides on the free list, and in the same breath assert that the consumer will get the benefit.

If the consumer happens to do so, it will be because these gentlemen can't help it. Can anyone fairly doubt their intentions to pocket the "change?"

They are equally zealous to tell you that the stock raisers and farmers who produce and sell cattle can get no benefit of the tariff on hides, because, they say, the value of the animal is not affected by the value of the hide, at the same time complaining that hides are too high by the amount of the tariff on account of the tariff.

At the outset, these live-stock associations, which now appear in behalf of the cattle raisers west of the Mississippi River, against the proposal to put hides on the free list, make no objection to removing the tariff if it be true, as asserted by the tanner and the shoemaker, that the value of cattle on the market or elsewhere is not affected by the value of the hide on that animal.

Forty-five per cent of the cattle slaughtered are sold on the markets at Chicago, St. Louis, Kansas City, St. Joseph, Sioux City, St. Paul, and Fort Worth. About 5,000,000 per annum are slaughtered by the big packers, and about 320,000 by others at those markets. Total for the past year was about 5,320,000, exclusive of calves. The total slaughter exclusive of calves in the United States is approximately [illegible] head. On this basis there are slaughtered elsewhere in the United States [illegible] cattle exclusive of calves. Those who slaughter the cattle buy them either at the same markets or at similar but smaller markets and stock yards, to which they are shipped for sale at every important city in the country, or they are bought and driven in by local butchers. Of the 71,267,000 cattle in this country, more than 2,000,000

e of disease or by accident, and from that source comes probably more than 1,000,000 llen hides.

There are hide dealers at every town and city, being more than a thousand such ncerns listed in the yearly directories and yearbooks on hides and leather, who mpete in both buying and selling.

It ought to need no more than a statement of those facts to show the absurdity of e claim that the stock raiser can get no benefit from the tariff on hides.

Fluctuations in prices of cattle and the wide range of prices of different grades of ttle are due to such a multitude of causes, more important than the 15 per cent of e hide value, that the attempt to draw the conclusion that the hide value is not even sent, be it what it may, is mere sophistry. Precisely the same can be said of the ctuations in prices of hides ranging to a much greater per cent than the amount of e duty. Such fluctuations prove nothing as to who gets the benefit of the 15 per nt duty.

Of course the consumer wouldn't get it if the packer, the tanner, and the shoemaker uld get it for themselves. The situation is such that they can't do it. That is why e tanner wants it off.

The mere amount of the tariff is not the only issue; a home market is, above all, the sirable thing. If you take the tariff off cattle hides, that means that the tanners ll stock up on the lowest-priced hides obtainable in the different markets of the rld. and bear the price at home accordingly. Hides produced here will have to be ld on basis of the lowest world market, and we will have to ship them to Europe for le. Thus the taking off of the tariff means a reduction in price much greater than e tariff figures. To satisfy you that such will be, as it was, the case, look at the otation of hides from time to time. If, in order to market, we must first negotiate ale and ship to Europe, our own stock raisers and farmers will lose the transporta- n, all charges, and commissions. The importance of this feature can not be over- timated.

For example, hides consigned to New York from South American points are, as we e reliably informed, being reconsigned from New York to London, because hides e higher in London. Now, the hide dealer in this country can't buy on expecta- n that such higher price there will continue; hence he must in safety discount ough to account for fluctuations.

The proposals of the tanners means upsetting a market the world over, of which he ne can take advantage.

Is that not "the milk of the coconut?"

We trust the committee will be cautious in its action, lest it most injure those who st need its consideration.

I.

We must assume in submitting these statements and arguments that on part of e committee there is an intention to deal fairly as between those engaged in different es of business and as between different localities, and that the investigation is held r the purpose of the ascertainment of facts and conditions with a view of making ws for the whole country and not to subserve some special interest. If the judgment the committee is to be based on facts, there should be no mistake in ascertaining em. The committee, we assume, is not a tribunal which merely affords an oppor- nity for interested parties to present their case, but owes the paramount duty to the untry to itself ascertain the facts, whether those whose interest may be affected pear or not. No judgment by default, or decree pro confesso, can be had, nor ould ex parte statements be taken as true merely because no one has come forward deny them. That stock raisers and farmers can not be expected to appear indi- dually at Washington, like the tanners and manufacturers of leather, is evident m the fact of the comparatively small interest each farmer or stock raiser has in llars and cents in the 15 per cent tariff on hides. The aggregate is as large to them the leather men, but so diffused that they must rest their case with their repre- ntatives.

The associations above named, representing the cattle business, beg leave to file s written statement and argument, in answer to the claims of the tanner and leather nufacturers:

1. We insist that if there is to be a protective tariff the stock raisers and farmers e entitled to equality under the law, be it a good or bad law, as well as others, though it enhances the price of their products, because they are denied free access the markets of the world for what they buy and are made to pay a higher price on count of the tariff on manufactured articles.

2. If the American stock raisers and farmers must patronize the American market what they buy, they demand in turn the same benefit of furnishing the home pply with what they raise to sell.

3. The American stock raiser and farmer does and will furnish enough cattle hides to supply the consumption in this country unless forced to curtail business by prices to meet foreign competition.

4. The reduction of cattle values from outside competition by free hides or cattle, or both, will demoralize the cattle-raising business, lessen our home supply, and in the end increase the cost of meat and meat products and hides.

5. Fifty-five per cent of the hides of cattle produced in this country are [illegible] and sold by others than the big packers and are marketed everywhere. While the level of price has generally been more than in foreign countries from which we [illegible] cattle hides, it has fluctuated between extremes as much as at any of the hide markets of the world.

6. We dispute the claim that cattle raisers do not get any benefit of the 15 per [illegible] duty on hides.

7. We dispute the claim that the value of cattle on the market is not affected [illegible] the value of the hides.

8. We assert that it costs the American stock raisers and farmers materially more [illegible] produce cattle and hides than it does in Mexico, South America, and Africa.

9. We dispute the claim that the public will receive the benefit of taking the [illegible] off hides, but insist that the very motive which prompts the activity of the tanners and manufacturers for free hides is to pocket the profit themselves.

10. We assert that the tanners have now free access to the markets of the world [illegible] hides to make into leather for export, and that the shoe manufacturers are from [illegible] to year increasing their exports of shoes.

11. We submit herewith tables showing the commerce in hides, leather, and shoes and comparative prices and values, covering imports and exports, for the years shown as follows:

[Tables from "Commerce and Navigation," published by Department of Commerce and Labor, [illegible]

III.

n its report on the beef industry the Department of Commerce and Labor (1904) mated our annual beef supply at 13,000,000 head, of which approximately ,000 are annually exported, leaving 12,500,000 (see pp. 53 to 57); of this number it estimated that the six large packers slaughter 45 per cent. If this be approxi-ely correct, then, of the total, butcher hides produced by packers are 5,425,000. ce 1904 there has been an increase in cattle, other than milch cows, of 15 per cent 1907 Statistical Abstract). Assuming butcher hides to have had a similar in-se, the total would be 14,375,000, of which the six large packers, however, have increased their slaughter.

he Bureau of Animal Industry estimated about 2,324,773 cattle that die by disease accident for 1904. To what extent the hides are taken we know of no figures to s. That it is a large per cent there can be no doubt, probably at least 50 per cent, ,162,386, total animal-hide production of fallen hides that go into the open market. les undeniably are as extensively produced and marketed as the distribution of le which stock raisers, farmers, and small butchers produce and market every-re

he value of cattle hides imported for nine months, 1908, shown by Summary of merce and Finance of United States for September, 1908, was the average 11.5 s per pound.

he importation of hides of cattle decreased in 1907 compared with 1906, and for the e months ending September, 1906, 1907, and 1908, show a decrease in importation les of cattle; 1908 shows 6.4 per cent under 1907, and 18.4 per cent under 1906.

uring the same nine months, importations of leather and leather articles declined llows: 1908 under 1907, 45.8 per cent, and under 1906, 35.3 per cent.

uring the same period (nine months' comparison), there was an increase in exports her 10.9 per cent over 1906, and almost as great export as for same period, 1907.

n the case of sole leather there was an increase 1908 over 1907 of approximately 7 cent though a large falling off as compared to 1906, which was an unusual year importation of hides, which, no doubt, were made into leather and exported. le leather is chiefly exported from imported hides, with a drawback equal to the y.

t may be fairly gathered, from the total cattle slaughter of around 12,500,000 to 00,000 head, and probably 1,000,000 fallen hides, that we produce cattle hides 14,000,000, and at 60 pounds average, which is under the average green, and 15 cent shrinkage in curing leaves 51 pounds per head, total weight cured hides, 000,000 pounds, as compared to about 134,000,000 pounds of cattle hides imported. we deduct the 31,000,000 pounds of sole leather exported, and the leather manu-tured articles shown in the foregoing tables, it seems certain that so far as cattle es are used for articles consumed in this country, our production is sufficient for home consumption. Furthermore, that there is an open market for 55 per cent of cher hides and all fallen hides, making in all about 40 per cent in hands of the big kers at time skinned, and 60 per cent widely distributed.

IV.

The Union Stock Yards, Chicago, have just issued for distribution among th stockmen attending the International Live Stock Exposition, now holding its annu meeting at Chicago, the following statement:

"*To stockmen and farmers:*

"Do you know that 44.7 per cent of the 2,154,690 cattle received at Chicago s far this year have been sold and shipped alive, mainly for eastern slaughter an export? Also, that last year the number was 43.9 per cent and the year before 40 per cent, while during several months this year over 50 per cent were sold and shipp alive?

"The significance of this increasing percentage of live shipments lies in the i of growing competition among buyers on the Chicago market.

"Eastern buyers and exporters are constantly on the market, and they look t Chicago as headquarters for supplies, thus furnishing at all times full competiti From 40 to 50 per cent of the total cattle receipts at Chicago are sold on the mark for shipment alive, mainly to eastern slaughtering points and to the seaboard f export."

On January 15, 1908, the same company issued and distributed the following car showing the sale and disposition for a week and the wide range of slaughter:

"Just think of it! Outside buyers in a single day buy on the Chicago mark and ship out 681 carloads of live stock to 195 different consignees at 150 differe points in 9 different States.

"As showing the increasing outside competition in buying and wide range of di tribution of live stock sold on the Chicago market, the following reports of the p week's shipments are quoted:

"Monday, out of 2,515 carloads received, outside buyers bought and shipped 681 carloads of live stock to 195 different consignees at 150 different points in 9 differe States. Fourteen consignees shipped 322 cars, while 181 consignees shipped 359 and there were more than 100 different shipments of 1 carload each. Monday's cat shipments totaled 10,475 head, breaking the record for one day. Of these, only head were stockers and feeders.

"Wednesday, out of 1,744 cars received, 499 cars were sold and shipped alive 198 different consignees at 167 different points in 10 different States.

"Thursday, 1,100 cars were received, while 420 cars were shipped to 132 differ consignees at 78 different points in 16 different States.

"During the week there were shipped out 2,306 carloads, or 113,910 head of l stock, of which 1,655 carloads, or 34,839 head (averaging 21 head per car) were cat constituting 48.6 per cent of the receipts.

"This week, starting out with active markets, a strong demand from every sec and prospects for good prices, notwithstanding Monday's run of 3,050 cars, or ab 136,000 animals, bids fair to exceed the above records.

"These figures prove that the outside demand and competition for beef cattle all other live stock at Chicago is greater than ever."

Later and in February the same company issued a card containing similar info tion for one day's business, Monday, February 10, 1908, as follows:

"Chicago's enormous live-stock receipts and shipments create new records. promptly absorbed.

"Monday, February 10, 1908, the Chicago Union Stock Yards received cattle, 1,303 calves, 87,716 hogs, 26,999 sheep, and 838 horses, or a total of 15 animals, in 2,933 cars, breaking the previous record of hog receipts and total num of animals received.

"Of the receipts, there were sold and shipped alive mainly to eastern slaughte points and for export, 10,063 cattle, 28 calves, 21,138 hogs, 6,469 sheep, and 109 ho or a total of 37,807 animals in 787 cars, breaking all previous records of hog shipm total number of carloads shipped, and total number of animals shipped.

"The grand total handled by the railroads and the Union Stock Yards and Tr Company on that day was 188,164 animals and 3,720 cars, which is equal to a train over 28 miles long, or if ranged in single file would make a solid process animals over 200 miles long and require ten days to pass a given point marching stantly at the rate of 20 miles per day. This is something never before equ Moreover, all were quickly and easily handled.

"Monday's enormous receipts were promptly absorbed at only a slight reduc from the prices of the previous week, practically all being sold on day of arr Packers got upward of 51,000 hogs, shippers bought close to 25,000, and the remai were mixed hogs, mostly sold to speculators. Of the 11,000 left over 4,000 carried over by shippers and 7,000 by speculators, almost everything being sold

"No other live-stock market in the world could have withstood such an enormous un in proportion without a disastrous break in prices. Yet so great is the demand r meats and live stock of all kinds at Chicago that Tuesday, with full ordinary eceipts, hogs sold 5 to 10 cents higher and cattle and sheep about steady, while Vednesday's markets show further advances of 5 to 10 cents in every department.

"The above facts demonstrate the value to shippers of Chicago's splendid market cilities, her practically unlimited capacity for handling live stock, and the constant emendous demand at Chicago for live stock of all kinds at the highest average rices.

'These statements of figures we have no reason to doubt, and they point to the ct that the stock raiser and farmer get the benefit of whatever competition there is r the entire animal and all parts going to make up its value. The eastern buyer ts the hide as well as the animal, and undoubtedly for both when he buys the one, lying upon his expectations to sell the hide as well as the meat in proportion to its lue.

The total cattle marketed at Chicago for 1907 was 3,305,314 head; calves, 421,934 ad. Of the cattle thus marketed, there were 377,000 of western range cattle, or 11.4 r cent; the balance came mainly from corn-belt States. The committee will find, it cares to investigate it, that Iowa leads in the total, and that the best cattle are arketed in one, two, and three carload shipments by the farmers from all the corn-lt States, and these furnish a large part of the shipments to eastern slaughtering nts."

The contention that the farmer gets no advantage from higher priced hides is absurd view of these facts, and that the hides are bought by the tanners from the local tchers. That the price of the hide is an important factor is so well stated in an ticle written by J. A. Spoor, president of the Union Stock Yards, of Chicago, appear-g in the Live Stock World of January 1, headed "Live Stock Trade of 1907," that copy as follows:

"No. 1 packer's heavy native steer hides made a decline from 16¼ to 16½ cents in uary, to 11½ to 11¾ cents in December, or more than 28 per cent, making a differ-ce in this item alone of nearly $4 per head in the returns from medium to prime tive steers, while packer's prime tallow declined from 6¾ to 7 cents in January to to 5¾ cents in December, or over 18 per cent, making a further difference in returns about $1 per head, with the decline still greater on the poorer classes of hides and aper grades of tallow, and there was a similar decrease of values for all other by-ducts."

It is a matter of common knowledge among stockmen that there was a serious decline prices of cattle during 1907, concurrent with the decline in hides. This decline s substantially similar at all markets. Of course there are a multitude of condi-s which affect the price, and always present the effort of buyers to purchase at low a figure as they can secure. When the supply is great the buyer dominates the rket, and when the supply is less that power is less. That applies to the animal as ole and necessarily to every part of it which competitive buyers can use; certainly the hide, because there is no special expensive equipment essential to taking care the hide and a ready market for them to the tanners. Aside from calves, the claim t the packers handle, on the average, the heavy hides and other slaughterers the hter hides has little, if any, foundation, when it is remembered that they furnish only market for canners on which the hide weight is much below the average.

V.

The controversy mainly arises on the demand of manufacturers of shoes, and ers, that hides be placed on the free list, which is one of the plans advocated ing to a reduction in cost of leather. If the stock raiser and farmer must suffer this reason, just let it go round, then the protective system will go down altogether. Under the present law the tariff on cattle, hides (dry, salted, or pickled), is 15 per t ad valorem, provided that upon all leather exported made from imported hides re should be allowed a drawback equal to the amount of the duty paid on said les, etc. (See item 437, effective July 24, 1897.) On leather there is an ad valorem ty of 20 per cent, with the exception of certain sorts of leather not necessary to ify. On shoes and boots there is an ad valorem duty of 25 per cent. (See item .)

The proposition which is made by the above-named associations is that the duty hides be not reduced, because the duty is very small, and they are as much entitled it as anybody else.

The contention on the part of the manufacturers is that the tariff should be taken hides on the theory that they want "free raw material." Hides are as much the

product of labor and skill as anything else, hence can not be called raw material. The "free raw material" argument has for its major premise the denial of the right of protection to the producer of such articles as some one else wishes to prepare for market or manufacture in some other form, and to have and demand a protective tariff on what in turn he produces for sale sufficient to put the outside competitors practically out of business. The manufacturer in such a case asserts with great vehemence the correctness of the principles of protection that he desires to apply in such matters to best subserve his own purpose, regardless of the effect it may have on others, in denying the same sort of rights to the farmer and stock raiser. As part of the plan he insists not only for the protective tariff on what he produces, but for the articles which he wishes to use in his business; he wants to buy in the markets of the world without having to pay any import duty, and to force the farmer and stock raiser to meet that competition. That is, that he be accorded the protection in order that he may increase his business, or the price, and that others equally meritorious as citizens of the country shall be denied the same privilege in order that he may profit.

He says it costs him more for labor and materials than his foreign competitor, overlooking the fact that the farmer and stock raiser is in the same boat.

The claim that no labor or investment is required to produce a hide is quite applicable to tallow and meat. It takes three years to mature a 3-year-old steer, and where land is exclusively devoted to grazing an investment of an average of $5 in land and constant care and attention. The investment in the property on which to raise cattle and feed them is enormous, and the investment in farm value of cattle alone is many times greater than all the leather and shoe business of the country.

As applied to commodities of prime necessity which are not produced in this country, and as to which the stimulation of reasonable protection will not induce any considerable production, it may be, and as a rule probably is, best where the protective system is adopted as a policy of government to admit such articles free of duty in order that they may be manufactured and the finished product supplied to the consumer without being burdened with the import duty. In such an instance we are concerned only in the use, manufacture, or trade of the article so imported free of duty, and are not concerned in the producers of the article, and hence under no obligation to protect his interest as a producer. The case is entirley different when an article of commerce is a matter of extensive and general production in this country, where great numbers of people must suffer loss by being compelled to meet the price at which it might be imported free, when the cost of production in this country is greater than it is in countries from which such products would be drawn if imported free of duty.

In the case of hides, it is perfectly plain that if they are to be put upon the free list then we must undertake to sell hides in all of the markets of the world in competition with those produced everywhere else, and that regardless of the circumstances of the cost of production. We must be robbed of our home market to seek one elsewhere so long, at least, as the markets in other portions of the country are better. The absurdity of the proposition as applied to hides of cattle so extensively produced in every State in the Union needs no argument to support it if the principle of protection is to be applied at all, and if when applied it is to be done fairly to all interests and not as mere favoritism, and by protective system we do not mean merely on leather products but on all the farmer buys.

Perhaps the stongest objection to the protective system is that in its practical application it builds up an individual or a business or a class of individuals and their business by giving them an advantage over producers in foreign countries or the importer from foreign countries, which advantage must be paid for to the extent to which it may exist by the public of this country as consumers of the articles thus protected, and in this way the localities where the business which is protected exists is favored to that extent as may be business incidentally or directly connected with such protected industries, to the detriment of the other part of the country. The principles of government recognized in this country are that no special interests shall be subserved by law, and it ought not to be the intention, therefore, of the protective tariff to subserve a special interest. The object is to subserve the best interest of the whole country, and we may assume that the people of this country have decided correctly that that can be best done by a protective tariff, but at the same time they have not meant to decide that a protective tariff shall be applied with partiality and one large and meritorious class of people be deprived of it in order that some others may make greater profit in their business; and this is the very use to which the manufacturer here seeks to make by his demand for free hides and free wool.

The point at which the people suffer in such a case is that they pay a higher price for the protected article because there is a duty upon it. This may not be the case in all instances, but as a general proposition it can scarcely be denied. We may assume that the public has decided that it is best for the people as a whole that they ...

pay a higher price, if by doing so great industries are built up in this country, by protection from outside competition, laborers employed, and the manufacturer and laborer in turn becoming the customer for that which is produced in other spheres of industry. The theory is that if a factory can run, pay good wages, and supply the trade by furnishing a market for the farmer, and that although the farmer may have to pay a higher price for the manufactured article, he is thereby furnished a market for what he grows and gets a better market for it, and in the end is more benefited than damaged. That is to say, the great home market is built up. The ability of the people in this country as consumers to afford a market for the production of this country is wonderfully enhanced by the fact that we manufacture at home what we need and that we can better afford to pay more for it.

This is the backbone of the argument in support of the protective system, which means higher price on manufactured articles than would exist could we go into the markets of the world and import them free of duty.

Now, let us apply this argument to the cost of the production of hides. If the principle is good in the one case, it is good in the other, and it is plain to be seen that the producer of hides is as much entitled to a protective tariff on hides in order to enable him to get a higher price for the hides than otherwise he would get, and thus stimulate the production and make him better able to buy manufactured articles, as is the manufacturer. The right to equal protection of the law entitles the stock raiser and farmer to the benefit of a protective tariff on hides or wool, so long as it exists on the things which he buys, and the opportunity at least to benefit by it, precisely in the same manner and for the same purpose that the manufacturer is entitled to it can not be fairly denied.

Much has been said about benefit that the farmer derives from protection, but the instances are very rare where he derives a direct benefit from the duty on the articles which he produces. The benefit is said to arise from the general application of the protective tariff in that it affords him a better market wherever he can be protected, in order to enable him to get a better market and a better price. But on what principle can he be denied the same protection on his products, so that he in turn may become a better customer of the producer or manufacturer, and thus make a better market for the latter?

On what principle can it be asserted that the producer of sugar is entitled to a protective tariff which will not equally apply to the production of hides or the manufacture of leather? The tanner wants free hides; the shoe manufacturer free leather and free hides: both from selfishness.

The contention that some one between the producer of hides and consumer of leather takes advantage of his ability to monopolize the market on hides and deprive the stock raiser and farmer of the benefit of protection has no place in the argument upon the question as to whether or not the producer of hides is entitled to a protective tariff. If this is a monopoly against the hide producers, it is the duty of the Government to destroy it and not to destroy the producer of hides. If there is to be established the principle that wherever the producer of an article protected is deprived of the benefit of the protection by monopoly, and on that ground the product is admitted free of duty, the law will have placed a premium on monopoly, which it should destroy. It simply enables the monopoly to buy cheaper. Suppose, for example, the duty should be taken off the hides, and they should be bought in foreign countries and laid down in this country 15 per cent less than the present value of hides, who would get the benefit of it, if such monopoly exists as is asserted? The place at which to begin on point of law to meet conditions that may be thus produced by monopoly is not by taking the tariffs off so-called raw materials produced by the farmers and stock raisers of this country, who do not create monopolies, but to take the tariff off the manufactured articles, so that the consumer will get the benefit in the end. If the producers of leather in this country have sufficient control of the hide market that they can name the price at which the producer must sell the hides, they can equally be as powerful to name the price of leather made from imported hides.

Now, suppose the tariff were taken off the hides and they are permitted to go into the markets of the world and buy them as cheap or cheaper than they do in this country. Can anyone give any assurance that the price of leather will decline on that account? And suppose the price of leather does decline—who can vouchsafe that the manufacturers of shoes will sell them cheaper because of the lower price of leather? The fact is that neither the price of leather nor shoes has fluctuated with the price of hides.

It will be interesting to compare the price of hides, leather, and shoes at stated periods during each year for several years past. It will doubtless be found that the relative price of shoes was in the main not apparently affected by the price of leather or the price of hides.

From two-thirds to three-fourths of all the beef cattle produced in the Uni[illegible] States come from west of the Mississippi River, and necessarily the hides are produ[illegible] in that section. To say that the value of the animal is not affected by the va[illegible] the hide is equivalent to saying that it was not affected by the value of the wo[illegible] the quality, character, or value of the meat. We might admit that under som[illegible] cumstances the owner of the animal may not be able to get as much as it is [illegible] compared with what the consumer finally pays for the finished and prepared pr[illegible] but that does not mean that the value of the animal is not affected by an ab[illegible] higher or lower price of some material part of it. The question is, Shall the [illegible] declare that the producer of these great articles of trade shall be deprived [illegible] benefit of protection for the same purpose which the manufacturer has it, upo[illegible] mere assertion of some one who perhaps knows nothing about it, that the valu[illegible] the animal is not to be affected by the tariff on hides or on wool? A false asser[illegible] made for profit.

Equality of opportunity is a maxim of the law, and it lies in no man's mouth [illegible] that a certain class shall not have it because of the assertion that it can not mak[illegible] of it. It certainly can not if the law denies the right.

Undeniably the prosperity of the live-stock business in cattle, sheep, and hog[illegible] the country west of the Mississippi River has made the upbuilding of that vas[illegible] possible, and has added commercially to the prosperity of the whole country. [illegible] to that source which the manufacturers of the East must look to sell their produ[illegible] and if the people of that great section are to be impoverished in order that profits [illegible] be still greater for the manufacturer in the East, or for any other reason, it will [illegible] perversion of the professed principles underlying the protective tariff system [illegible] only a few articles can they possibly directly benefit by protection. Shall it be [illegible] denied on those?

It may be said that the motive on the part of the stock raisers and producers [illegible] hides and wool is for a protective tariff in order to profit by it; that is true. Why no[illegible] Surely no less can be said of the motive of those who seek to put hides and wo[illegible] the free list. If these articles should be put on the free list in order that the ma[illegible] facturers may prosper to a greater extent than now by being able to seek a chea[illegible] source of supply, why should not the farmer likewise be entitled to go abroad to [illegible] his supplies, because to do so he may prosper more than now?

Millions of people are engaged in producing animals, hides, and wool. Shall th[illegible] be sacrificed, and the manufacturers of those products, far less in number, be give[illegible] a special privilege, on the mere assertion that to do so will reduce the price of sh[illegible] or clothes to the consumer? Cast up and see who is making the most profit. Th[illegible] manufacturer has no notion of reducing the price; his motive lies in getting the mo[illegible] profit from the man who toils to make the so-called raw material, and to buy [illegible] manufacturer's goods. He is not in business for benevolence. He haunts the ha[illegible] of Congress and the hotel lobbies at Washington, while the farmer herds and fe[illegible] his stock, and tills the land and supports his family, for whom he buys the cloth[illegible] and shoes from which the manufacturer profits. The manufacturer looks after mak[illegible] the laws in person, the farmer and stock raiser must leave it to his representat[illegible] What will be the result?

VI.

The live stock interests which are represented desire to call specific attention [illegible] Ways and Means Committee to the importance of this industry to the prosperit[illegible] the nation, and that its trade should be fostered in every way to the end of th[illegible] market at home and abroad, and we here copy an extract from the pamphlet [illegible] by the Agricultural Department Bureau of Statistics, Bulletin No. 55, as follow[illegible]

Importance of the Meat Industry.

With a meat export in 1900 amounting to one-eighth of the production, the grow[illegible] of meat animals and the manufacture of the products derived from their slaughter [illegible] largely dependent upon the export trade, and the foreign marketing is essentia[illegible] the maintenance of the present magnitude of the meat industry and of prices profit[illegible] to the farmer.

Although this is a country of meat eaters, with a total population estimated b[illegible] Bureau of the Census at 84,000,000 in 1906, the surplus of meat produced in 190[illegible] estimated in the preparation of this bulletin, was large enough to feed either [illegible] United Kingdom or the German Empire for nearly half a year, or both [illegible]

three months; the population of those two countries in 1901 was 98,000,000, as compared with a population of 76,000,000 in this country the year before.

If such an immense quantity of surplus meat food were to be confined within this country by the refusal of foreign countries to buy it, there would follow consequences to farmer, rangeman, slaughterer, and packer which would be financially disastrous.

In the valuation of all domestic animals in the census of 1900 the kind of meat animals having the highest value in the aggregate was cattle. The value of all cattle on farms and ranges and off farms and ranges in cities, villages, and elsewhere, was $1,500,000,000, about one-third of which is the value given to dairy cows and two-thirds to other cattle. Swine occupy second place in order of value, but much below the total for cattle, the figures given being $239,000,000. Sheep have third place with $171,000,000, and goats have the small place indicated by $3,400,000. A grand total value of all meat animals on and off farms and ranges, according to the census, was $1,929,000,000.

The latest annual estimate of the value of meat animals on farms and ranges made by the Bureau of Statistics of the Department of Agriculture, January 1, 1907, gives to dairy cows the value of $645,500,000, or an increase of $137,000,000 over 1900. The decreased total value given to other cattle, although the value is larger per head, somewhat offsets the increase for dairy cows, since the loss in other cattle is $85,000,000 from the value of 1900. The estimate for sheep for 1907 indicates an increase of $34,000,000 in value above the census statement, and for swine an increase of $186,000,000; there is no estimate for goats, which, for present purposes, may be regarded as having the 1900 census value.

Meat animals on farms and ranges January 1, 1907, increased in value in the aggregate $272,000,000 above the census amount of June 1, 1900, and rose to a total value of $2,152,000,000. The estimates of this department are for January 1, a time of the year when the number of swine and sheep is about one-fifth less than that on June 1, which is the census date, and the number of cattle is less in midwinter than on June 1. Hence, if the department's statements for January 1 were raised to a basis of June 1, the foregoing values for 1907 would be increased.

OTHER ITEMS OF CAPITAL.

Not only are the prices of meat animals directly affected by the marketing of the national surplus of meat, but likewise the value of the farms and ranges on which they are raised. While nearly all farms maintain at least one meat animal, the farms and ranges devoted especially to the production of live stock are the ones more directly affected.

The value of live-stock farms and ranges was estimated by the Bureau of Statistics of the Department of Agriculture in 1905 to be $7,951,000,000, by adding to the census valuation the increase of the succeeding five years. Some horse and mule farms are unavoidably included.

To the value of meat animals and of live-stock farms and ranges should be added the value of implements and machinery on such farms and ranges, or $235,500,000.

Then there is a large amount of capital invested in wholesale slaughtering, meat packing, lard refining, and oleomargarine establishments which was determined by the Bureau of the Census to be $238,000,000 in 1904.

The sum of the foregoing items of capital directly affected by the export of the national surplus of meat is $10,625,000,000 and this capital is directly dependent upon such disposal for its profitable use and, indeed, for the integrity of the investment.

In addition to the capital concerned there are annual productions that should be noted. Upon the basis of census values the farm value of the cattle, sheep, and swine slaughtered and exported alive in 1900 was $649,417,340. This is a computed value which may be above or below the fact for 1900; but whatever the true value was for that year, it was much larger for 1906, with its high values and large exports as well as perhaps increased home consumption.

The great annual corn crop of the country, having a value of $1,167,000,000 in 1906, is very largely converted into meat, fats, and oils, and a large fraction of this crop is exported in the form of the commodities mentioned.

Capital directly affected by exports of surplus meat.

Item.	Value.
Value of domestic meat animals on farms and ranges, January 1, 1907	$2,152,330,1[illegible]
Value of domestic meat animals not on farms and ranges, June 1, 1900	48,627,[illegible]
Value of live-stock farms and ranges, 1905, autumn	7,950,919,[illegible]
Value of implements and machinery on live-stock farms and ranges, June 1, 1900	235,4[illegible]
Capital of wholesale slaughtering, meat-packing, lard-refining, and oleomargarine establishments, 1904	227,714,[illegible]
Total	10,625,0[illegible]

COMPARISON WITH OTHER INVESTMENTS.

Better to understand the magnitude of the interests involved in the maintenan[illegible] of meat exports, comparisons may be made with other aggregates of capital and class[illegible] of wealth. The capital directly related to meat production for export, $10,625,000,00[illegible] is five-sixths as large as all capital invested in manufacturing in 1904. It is bar[illegible] under the figures representing the capitalization of the net earnings of steam rai[illegible] roads, estimated by the Bureau of the Census, June 1, 1904; it is a little greater tha[illegible] the estimated true value of all property situated in the South Central division [illegible] States in 1904, as also of all property situated in the Rocky Mountain and Paci[illegible] regions. It is more than one billion dollars above the value of the real estate and [illegible] the implements and machinery of farms devoted chiefly to producing cotton, hay, and grain; or the estimated true value of all property situated in New England i[illegible] 1904; or the estimated true value of the entire real estate of the South in 1904. It i[illegible] nearly twice the value of the real estate and of the implements and machinery [illegible] farms devoted chiefly to producing cotton, fruit, rice, sugar, tobacco, vegetable[illegible] and to general farming; or more than twice the estimated true value of street railway[illegible] shipping, waterworks, telegraph and telephone systems, electric light and pow[illegible] stations, Pullman and private cars, and canals in 1904.

Meat capital compared with other capital and classes of wealth.

Item.	Value.
Capital directly related to meat production for export	$10,625,0[illegible]
Capital invested in manufacturing, 1904	12,686,2[illegible]
Capitalization of net earnings of steam railroads, June 1, 1904	11,244,732,[illegible]
Value of real estate (1905, autumn) and of implements and machinery (1900) of farms devoted chiefly to producing cotton, hay, and grain	9,074,16[illegible]
Value of real estate (1905, autumn) and of implements and machinery (1900) of farms devoted chiefly to producing cotton, fruit, rice, sugar, tobacco, vegetables, and to general farming (including small specialties)	5,702,314,[illegible]
Estimated true value of street railways, shipping, waterworks, telegraph and telephone systems, electric-light and power stations, Pullman and private cars, and canals (1904)	4,480,54[illegible]
Estimated true value of entire real estate of South Atlantic and South Central divisions, 1904	9,506,9[illegible]
Estimated true value of all property situated in New England, 1904	8,[illegible]
Estimated true value of all property situated in the South Central division, 1904	10,052,[illegible]
Estimated true value of all property situated in the Western division (Rocky Mountain and Pacific regions), 1904	9,902,[illegible]

Under the heading "Stock of Meat Animals—Number in the World," same bulleti[illegible] it is stated:

It appears that contiguous United States has 74,200,000 cattle of the 424,50[illegible] cattle known to be in the world, or 17.5 per cent. British India has a larger fract[illegible] or 20.9 per cent, but the fraction is smaller than that of the United States in [illegible] other country—one-half or less.

This country does not figure so largely in comparison with the total sheep, [illegible] the number in contiguous United States is but 53,500,000 of the 609,800,000 shee[illegible] or 8.8 per cent. This fraction is exceeded by that of three countries. Argentina [illegible] 19.7 per cent of the world's sheep as far as known; Australia has 12.2 per cent [illegible] European Russia 9.7 per cent.

The greatest prominence of this country in the possession of a meat animal is fo[illegible] in the number of swine. Of the world's 141,300,000 known swine, the United Sta[illegible]

has 56,600,000, or 40.1 per cent; Germany is the second country in order of importance with 13.4 per cent; Austria-Hungary follows with 9 per cent; and European Russia with 8.4 per cent.

In the possession of goats this country occupies a small place, since the number on and off farms and ranges is only 2.2 per cent of the world's goats as far as known.

The ages of cattle slaughtered is shown in Table 20 of same Bulletin (1900).

TABLE 20.—*Computation of slaughtered cattle, except calves, 1900.*

Item.	Per cent.	Number.
Total slaughtered	100	12,978,000
Steers, 1 and under 2 years	13	1,687,000
Steers, 2 and under 3 years	18	2,336,000
Steers, 3 years and over	17	2,206,000
Total steers	48	6,229,000
Bulls, 1 year and over	5	649,000
Heifers, 1 and under 2 years	13	1,687,000
Cows	34	4,413,000

As to slaughter of cattle and calves this bulletin shows as follows:

CALVES AND CATTLE.

On referring to Table 23 it will be observed that the computations previously xplained in detail indicate an available slaughter of 5,831,000 calves in 1900, of ,229,000 steers, of 649,000 bulls over 1 year old, of 1,687,000 heifers, and of 4,413,000 ows. The number of cattle available for slaughter, not including calves, was 2,978,000, of which 240,000 were exported alive, so that the cattle, except calves, laughtered in this country was 12,738,000. If to this number the slaughtered calves e added, the total slaughter of cattle was 18,569,000; and if to this number we add he number exported alive we have a grand total of 18,809,000.

The total cattle received at stock yards at 54 points in the United States where acking plants are located was 13,777,196; shipments out, 6,187,004; calves, receipts. 826,552; shipments out, 421,570.

(See 22d Annual Rept., Bureau of Animal Industry, p. 292.)

(For range in prices of cattle from 1894 to 1905, see pp. 286, 287.)

Upon request for the information the Bureau of Animal Industry has furnished us statement of the hide supply of the United States as follows:

The estimated total slaughter of cattle in the United States in 1900 was about 1,500,000 head, besides 5,000,000 calves, and presumably those respective numbers f cattle hides and calfskins were produced in that year. As the foregoing figures are sed upon the estimate of the total number of cattle on hand in the United States anuary 1, 1900, of 63,500,000, including calves, and as the estimated number anuary 1, 1908, was 71,267,000, it is roughly estimated that the hide production in 07 was about 13,000,000 cattle hides and 5,500,000 calfskins. The total number of nimals slaughtered under Federal meat inspection during the fiscal year ending une 30, 1908, was 53,973,337, consisting of 7,116,275 cattle, 1,995,487 calves, 9,702,545 heep, 35,113,077 swine, and 45,953 goats.

Thus there appears slaughtered approximately 1 cattle hide to each 6 persons and calf hide to each 15 persons.

VII.

LEATHER AND MANUFACTURES OF LEATHER.

[Statistical Report—Census of Manufacturers, 1905—Department of Commerce and Labor.]

Table 7 shows for 1905 the number of establishments reporting the different kinds materials, with the quantity and cost of each kind of material used; the cost of nings and trimmings and findings, and the amount paid for fuel, rent of power and at, mill supplies, freight, and all other materials.

The number of establishments given in this table is not the number of distinct tablishments, but the number reporting the different classes of materials. Consently some establishments are counted several times. The number using pur-

chased cut soles, counters, taps, heels, etc., was the largest, 908; of these establishments, 419 used these materials to the exclusion of uncut sole leather. The number using sole leather in the side was 678; of these, 162 did not use cut soles, etc., or heads, bellies, and shoulders. The latter class of materials was used by 425 establishments, but in only 26 exclusively.

TABLE 7.—*Materials used, by kind, quantity, and cost, and number of establishments reporting each kind, 1905.*

Kind.	Number of establishments reporting.	Unit of measure.	Quantity.	Cost of materials used.
Materials used, total cost				$197,353,[illegible]
Sole leather in the side	678	Pounds	162,631,578	36,66[illegible]
Sole leather (heads, bellies, shoulders, etc.)	425	...do	42,510,899	7,57[illegible]
Split leather, finished	157	...do	10,749,526	2,04[illegible]
Rolled splits	89	...do	3,890,791	6[illegible]
Calf and kip skins	232	...do	4,240,190	2,9[illegible]
Grain and other side leather	399	Square feet	89,610,877	11,9[illegible]
Calfskins (russet, ooze, kangaroo, dongola calf, etc.).	592	...do	91,290,110	16,3[illegible]
Patent and enamel leather	692	...do	47,720,221	12,0[illegible]
Goatskins	759	...do	197,044,004	30,2[illegible]
Sheep leather used for uppers	453	...do	36,473,154	2,[illegible]
All other upper leather	459	...do	73,012,064	12,5[illegible]
Material other than leather used for uppers	210			1,95[illegible]
Linings and trimmings, all kinds				10,5[illegible]
Cut soles, counters, taps, heels, etc., purchased	908			24,14[illegible]
Findings purchased				13,0[illegible]
Fuel, rent and power and heat, mill supplies, freight, and all other materials.				11,83[illegible]

Calfskins (russet, ooze, kangaroo, dongola calf, etc.), were used by 592 establishments, of which 313 did not use calf and kip skins. Calf and kip skins were used by 232 establishments, but only 38 used them exclusively. Of 157 establishments using split leather, finished, 86 did not use rolled splits; and of 89 using rolled splits, only [illegible] did not use split leather, finished.

There are two principal classes of leather used in the manufacture of boots and shoes—leather from which soles, counters, taps, heels, etc., are made, known as sole leather, and leather from which vamps, quarters, etc., are made, known as upper leather.

The cost of sole leather in the side, heads, bellies, shoulders, etc., as reported [illegible] the census of 1905 was $44,235,050. This amount, added to the $24,143,824 paid for cut soles, counters, taps, heels, etc., purchased, makes the expenditure for sole leather $68,378,874, or 34.6 per cent of the total cost of materials.

Upper leather cost $91,552,459, or 46.4 per cent of the total cost of materials; all upper material, including material other than leather, $93,508,605, or 47.4 per cent; linings, trimmings, and findings, $23,641,647, or 12 per cent; and fuel, rent of power and heat, mill supplies, freight, and all other materials, $11,834,369, or 6 per cent.

Of upper leather, goatskin was the most largely reported in 1905. As a result [illegible] the success attending the tanning of such skins by the "chrome" process there [illegible] been put on the market a glazed kid that gives the greatest satisfaction to manufacturers. Its cost was 32.2 per cent of the cost of all upper leather. Calfskin, [illegible] and enamel and grain leather were also used to a considerable extent, but sheep and split leather were used in comparatively small quantities. A large amount is included under "all upper leather," mainly because of the inability of some manufacturers [illegible] segregate the kinds and quantities of leather purchased. "Materials other than leather used for uppers" was separately considered at this census for the first time, and 210 establishments reported an expenditure of $1,956,146 for such materials.

Table 8 shows the number of establishments reporting the different kinds of products and the quantity and value of each kind for 1900 and 1905. The number of establishments is the number reporting the various kinds of products and not the number [illegible] distinct establishments. Therefore some establishments are included several [illegible]

TABLE 8.—*Products, by kind, quantity, and value, with number of establishments reporting each kind, and per cent of increase: 1905 and 1900.*

nount received for work done for others	89	148	$792,116	$1,073,576	126.2

The reports in 1905 showed that 24,144,616 more pairs of boots, shoes, and slippers re made in the United States than in 1900, a gain of 11.1 per cent; the value in-eased $60,267,121, or 23.6 per cent. The greatest increase was in the manufacture men's boots and shoes, the increase being 15,691,483 pairs, or 23.2 per cent, and 3,932,694 in value, or 31.4 per cent. Boys' and youths' shoes increased but 686,757 irs, or 3.3 per cent, while the value increased $3,562,001, or 17.2 per cent. The mber of pairs of women's shoes manufactured increased 4,498,223, or 6.9 per cent, d the value $16,457,713, or 20.1 per cent. There was a decrease in number of sses' and children's shoes manufactured of 426,235 pairs, or 1 per cent, but an rease in value of $3,962,308, or 13.2 per cent. The manufacture of slippers was reased to the extent of 425,450 pairs, or 2.5 per cent, and $1,062,226 in value, or per cent. For "all other kinds," which includes infants' shoes, moccasins, letic, and bathing shoes, etc., an increase of 3,268,938 pairs, or 61.9 per cent, and 290,179 in value, or 63.2 per cent, is shown. Instances of decreases and small reases in quantity which appear in the table are attributed to slight changes in sification, which resulted in swelling the total of "all other kinds" in 1905, thus sing the large increase in that item.

It is plain from the foregoing that the amount of cattle leather in shoes is so small pair that the difference in cost of shoes per pair on the average is so small that the sumer will not get any of it.

If we take the total leather, a pair of heavy shoes at 3 pounds, which is above the rage, and assume that cured hides make an average of 63 per cent leather and is rth 11 cents per pound for the hide, the weight of hide would be 4.8 pounds at cents, equal 52.8 cents, duty 15 per cent, equal 7.9 cents, or 2.64 cents per pound cattle hide in a pair of shoes.

Now, the per cent of heavy shoes to the total is very small, and considering the cent of sole leather used, and the fact that it will probably run as low as one-half nd, and average for all shoes probably 1½ pounds, it will be seen that the average erence in the cost of shoes per pair will not be more than 3 or 4 cents.

This seems to be borne out by the evidence before the committee. Now, look at fluctuations in the price of hides and leather for ten years of the tariff, and observe t every year, for the entire period, cattle hides fluctuated in price between the h and low levels, 15 per cent or more, and leather from 6 to 10 per cent or more, apparently with the price of hides, and it will at once be seen that it would be possible for the shoe manufacturer of shoes and leather to take care of this 3 or 4

cents per pair of shoes. What those fluctuations would have been with free hides there would be no way of telling.

The price of leather to the shoe manufacturer must be high enough to take care of the fluctuations in hides and leather, and the shoe manufacturer must put his price high enough to take care of the fluctuations in leather, which would swallow up the 3 or 4 cents. And this, assuming an active competition in both shoe and leather manufactures, which is doubtless more imaginary than real, so far as price to the consumer is concerned. Then comes the fluctuation in shoes sold to the retailer which he takes care of in his retail selling price, even where not a dictated price fixed by the manufacturer.

Puzzle: Find the 3 or 4 cents.

Key to the puzzle: Don't look for it in the pocket of the consumer.

Hence the sophistry of the argument that the 15 per cent on hides affects the price of shoes to the consumer.

Stock raisers and farmers think it worth an average of about $1 per head in the intrinsic value of their cattle, and that when the stock raiser of South America brings his hides here for sale this tax of 15 per cent is reasonable, and that it doesn't cost the consumer of shoes a cent. They want equality before the law, and pray this committee to leave the duty on cattle hides in order that the product of our farms have the benefit of the home market.

[Taken from Statistical Abstract, Commerce and Labor, for 1907.]

Year.	Milch cows.		Other cattle.		Total number.	Total val[illegible]
	Number.	Value.	Number.	Value.

1901	16,833,657	505,093,077	45,500,213	906,644,003	62,333,870	[illegible]
1906	19,793,866	582,788,592	47,067,656	746,171,709	66,861,522	[illegible]
1908	21,194,000	650,057,000	50,073,000	845,938,000	71,267,000	[illegible]

Does not this show that we can produce very nearly, if not quite, all the cattle hides needed for home consumption?

Mr. Cowan. I also desire to introduce the brief itself that Judge Rucker and I filed. It is a very short brief on meats.

The Chairman. It may be inserted.

Mr. Cowan. It was not until 1842, when the so-called Whig tariff act was placed upon the statute books, that a duty was imposed upon hides, and this duty in various forms, sometimes ad valorem and sometimes specific, was continued until the enactment of the Payne-Aldrich Act in 1909. During the hearings on that measure before the Ways and Means Committee the principal arguments made by the representatives of the tanners and the shoe manufacturers were based upon the assertion that free hides would result in a material reduction in the cost of boots and shoes, saddlery, and similar articles manufactured from leather to the consumer.

Statistics are unnecessary to prove to you, Mr. Chairman and members of this committee, that the promise of the shoe men and their associates has not been carried out. We make the assertion that there has never been a time since the Payne-Aldrich Act went into effect in 1909 that the consumer has been benefited to the extent of one cent, but on the contrary the shoe manufacturers, the manufacturers of harness, the manufacturers of traveling bags, and of brief cases, and the manufacturers of every other commodity of which leather is the component part of chief value has exacted from the consumer every dollar that the traffic would stand.

One need not go outside of the city of Washington to ascertain the ıth of this assertion. Within ten blocks of this committee room, Pennsylvania Avenue, there are a half dozen shoe stores. These ɔres are of the chain variety, and most of them are conducted by e representatives of the big advertising shoe manufacturers. Up ıtil the outbreak of the World War and, for that matter, for a year so after that the shoes of these manufacturers were advertised a retail price which was stamped on the bottom, and those prices ıre maintained in every city of the country where these establishɘnts were represented. The shoes of the same grade are still in istence, the same manufacturers are still advertising, but the shoes e sold at from 50 per cent to 100 per cent more than they were sold r five years ago, and during all this time hides have been free.

It is true that the price of hides has fluctuated and that during the orld War they reached such prices as they had never reached fore, in spite of the free importations under the free clause of the ıyne-Aldrich Act. But during the last year hides touched a point ı the opposite side of the scale and prices were down so low last inter that there was absolutely no market for them. It is even ported that one cowman in the Southwest hauled a two-horse agonload of dry hides to market which he exchanged for a set of ırness, and in spite of the fact that his team was loaded with all ıe hides they could haul he found that his load was several hundred ɔunds short of being sufficient to pay for the harness.

A few months ago an Iowa farmer is reported to have taken 14 ılfskins to a general store, which he wished to exchange for supplies, ıd he found that his 14 calfskins were valued at $1.45 less than the ıir of shoes which he obtained in exchange.

There has recently been extensively circulated in the form of ropaganda in the interests of shoe manufacturers and tanners a amphlet in which the statement is made that during the fiscal year ıded June 30, 1921, cattle hides to the value of $40,000,000, in round gures, were imported into the United States. The pamphlet says ıat the Summary of Foreign Commerce, issued by the Bureau of oreign and Domestic Commerce of the Department of Commerce, ɦows "that we exported foodstuffs to many foreign countries, includıg countries from which hides were imported, foodstuffs in crude ondition and food animals to the value of nearly a thousand million ollars, and foodstuffs partly or wholly manufactured to the value of 779,000,000." Note in this statement that the compiler of this amphlet calls attention to the fact that these foodstuffs were shipped broad, "including countries from which hides were imported." he inference naturally is that the compiler of this interesting docuɘent desires to impress the committee with the idea that the products f American farmers find their way into the countries from which we mport hides. It would be difficult for this special pleader to show herein hides from Argentina, Brazil, Paraguay, and Uruguay, from hich the large percentage of imported hides come, were paid for by he shipment of American farm produce.

The same advocates insist upon reiterating the assertion that the luty on hides is added to the cost of leather and leather goods, and hat the farmer and stock raiser secure absolutely no benefit from

the increased value of the hide upon the animals which they shi to market. It is true that the condition of a meat animal is th principal means of valuation when that animal reaches the live stock market, but it is also true that the condition of the hide ha a direct bearing upon the price of the animal. Every stockma knows that a steer whose hide is branded so that part of it is valu less for high-grade leather will not bring as much in the market a native steer bearing no brand whatever upon his hide, even thoug in other respects the two animals may be identical as to formatic and condition.

Every stock-yards buyer is an expert in his business and wh he buys he is posted on the leather market as he is on the mark for meat; and when hides are worth 40 cents a pound, as they we for a brief period during the World War, the steer will bring a bigg price than it brings to-day when hides are down below 12 cents pound. It is a rather peculiar position which the advocates of fr hides assume when they declare that the duty on shoes does n increase the cost to the consumer, but that a duty on hides do increase the cost to the consumer.

Reference to the brief filed by Judge Rucker of Colorado, in beh of the American National Live Stock Association and others during t hearings on the pending bill before the Ways and Means Committ (see Part V, p. 3722 et seq.) is made for the purpose of calling t attention of the committee to the brief history of a tariff upon hid beginning with 1842. Therein it is pointed out that from 1½ 2 pounds of dry hide is required to furnish the leather for the av age pair of men's shoes and that the tariff upon this portion o pair of shoes at the rate of 15 cents per pound would not exceed cents at the utmost. Purchaser of shoes would scarcely compl even if he knew that he was to pay this charge, and certainly farmer and the stockman would be the last to raise a protest agai this protection which he would have through the duty on hides against the producer of Mexico and South America.

All the arguments submitted in which it is attempted to show t the imposition of a duty upon hides will not benefit the farmer advanced not by farmers or the representatives of farmers, not the cattlemen or the representatives of cattlemen, but by th who are directly interested in reducing the cost of raw material themselves. These gentlemen have appeared time after time have insisted that the removal of duty would benefit the consu by reducing the price of all manufactures of leather.

We have had 10 years of free hides as the result of the argume of these interested manufacturers and their representatives. Du that time the price of hides alone has fallen, except for a brief pe during the war. On the other hand, the price of shoes, the pric harness, the price of saddlery, the price of hand bags, and the p of brief cases have all advanced continuously. Shoes and harness apparently among the last things to return to that "normalcy" which we hear so much to-day. In spite of the general business pression the manufacturers of shoes and harness are certainly i nitely more prosperous than the men on the farms and ranges have raised the cattle whose hides must compete with the produ the pampas and the ranges of Mexico and the great cattle-raising co

ries to the south of us. No industry of this country is suffering o-day to the extent that prevails among the cattlemen of the Southwest. A 20 per cent duty on hides is not much to ask, and we come ere firmly in the belief that even this small sop will aid somewhat oward recovering from the frightful depression resulting in part from he outcome of the war, but more largely from the elemental conditions through which we have struggled during the past few years. High prices of feed, combined with almost continuous drought and he free importation of hides, have brought to the verge of ruin the ntire stock-raising industry.

The remarks I made before this committee in 1911—of which you ave the print here, and there are copies available—I think was rdered to be printed as a public document.

The brief of A. W. Rucker on hides, that was filed before the Ways nd Means Committee, is a typewritten statement that I think conains his statements on that, which I will also hand in.

To the Committee on Ways and Means:

Hides were free until 1842, when the Whig tariff made them dutiable at 5 per cent d valorem. This was continued in the Walker (Democratic) tariff of 1846. The uty was reduced to 4 per cent in 1857, and restored to 5 per cent in the Merrill tariff f 1861; raised to 10 per cent later that year and so continued until 1872, when hides were placed on the free list. There they remained until 1892, when a duty of 1½ cents a pound was imposed. A duty of 15 per cent was substituted by the Dingley aw of 1897, which remained in effect until the enactment of the Payne-Aldrich bill n 1909. For 59 years out of the 79, therefore, hides were on the dutiable list. In 10 years under the Payne-Aldrich free list, i. e., from 1911 to 1920, inclusive, the total mportations of foreign hides into the United States were valued at $888,000,000. Had a duty been imposed upon this vast product of the herds of the surplus producing countries, a tariff of 15 per cent would have produced $133,000,000 of revenue, or upwards of $13,000,000 per annum.

It is claimed that a duty on shoes does not increase the cost to the consumer. This must rest upon the fact that the imports of shoes is negligible, yet we all remember that such a claim was the stock in trade of the manufacturer when he thought that the hide question was buried beyond resurrection. The targets for the artillery of the manufacturer and independent tanner now are the packers and producers of cattle. It is contended by the manufacturer that he and the tanner must have 40 or 45 per cent of foreign hides to enable the tanner to carry on his business and the manufacturer to continue in the export trade, that in addition to the duties sought to be imposed they are seriously handicapped by the packers' exorbitant charges to the tanner, and incidentally they make a strong plea for the pending packer legislation.

In this connection it is interesting to note the colloquy between the leading representatives of the shoe manufacturers and independent tanners and Representative Garner, a member of this committee, on the 11th of this month.

From that it appears that the manufacturers and the tanners would cease their opposition to the proposed duty if the wings of the packers were clipped as provided in the proposed legislation in question. We believe this committee should view with less concern the demands of the manufacturers and independent tanners, since their complaint is chiefly leveled at the packers and other home industries, whereas our relief must come solely from a duty levied upon foreign products.

But let us assume that the proposed packer legislation will not intervene to remove the objections. Then we are relegated to their original claim that they can not exist if the duty is levied and the packer is allowed to take his toll. Well, we have seen that they are still alive, that they have survived over that period when there was a duty and when there were packers, and they increased the number of their establishments, employed more men, increased their exports, and enjoyed immense profits, and in the abundance of their generosity increased the cost of their product to the consumer.

During the 12 years preceding the enactment of the Payne-Aldrich law, which placed hides upon the free list, our exports of boots and shoes increased from $1,500,000 to $11,500,000, or 798 per cent. During the same 12 years our imports of boots and shoes increased from $43,000 to $164,500. In other words, during that period our exports exceeded our imports by 700 per cent. The imported boots and shoes during

that period when a duty remained on hides represented one two-hundred-thousandth part of the total value of the boots and shoes manufactured in this country. As was stated by one of the signers of our brief in the House of Representatives in July, 1909:

"In the face of this showing, the boot and shoe manufacturers need not fear the foreign competition; and still they want a duty to protect them from foreign competition while at the same time denying any sort of protection to the hides of the cattleman."

History repeats itself—the same crowd of philanthropists are here to-day, playing on the same single-stringed instrument that they used 12 years ago.

In 1909 the same lobby told the same story to the Ways and Means Committee of the House when they asserted that the packers would drive the tanners, as well as themselves, out of business if hides were not placed upon the free list. They claimed then, as they claim now, that the meat packers' trust controls the great majority of the hides in this country. In answer to this contention, attention is called to the report of the Bureau of the Census of the Department of Commerce, to the effect that on November 30 last, there were on hand, in round figures, 12,000,000 cattle, kip, and calf hides, of which virtually 50 per cent were either domestic country hides or foreign hides.

A similar report from the Bureau of Markets of the Department of Agriculture showed that during the fiscal year which ended June 30, 1920, the average number of hides produced in this country outside of the packing houses ran from 20 to 2[illegible] per cent of the total number of hides produced. The same report shows that during the same period foreign hides imported equaled from 28 to 47 per cent of the total number of hides produced in this country.

With this evidence before us, one will not necessarily tremble with anxiety lest the hands of the landlords of the Washington hotels will be heavily laid upon the baggage of any of these representatives of the shoe industry for their board bill. Nor need we make extensive drafts upon our sympathies for the independent tanner, because it is not true that the packers have closed the markets for hides as is claimed. In addition to what we have already said, there is that great reservoir, country hides, which they can draw from, as well as the surplus which is always on hand obtainable from the packers. That is not all, for, as we pointed out in our statement to the committee, the abundant surplus in the competing countries overseas, coupled with their low cost of production, will afford another and limitless market to draw from, even though the proposed duty should be much higher than we ask.

Tracing back to 1908, we find that the total value of hides (including buffalo hides) imported that year was $12,000,000. Following the figures in the Statistical Abstract, it is seen that in the fiscal year 1910—which was the first year under the law allowing free importation—the value of hides imported leaped to $46,000,000. The minimum of importations since the enactment of the Payne-Aldrich tariff was reached in 1913, in which year the valuation of importations fell to $41,000,000. The maximum, $125,000,000, was reached in the fiscal year ending June 30, 1919. In spite of a glutted market following the close of the World War, the importations for the year which ended June 30, 1920, reached the total of $104,000,000.

Against these importations of the raw hides the Statistical Abstract shows that in the year 1908 the total exports of all leathers and leather goods, including boots and shoes, were valued at $45,000,000. The peak was reached in the fiscal year ended June 30, 1919, with total exportations of leather and leather goods to the value of $303,000,000. This total fell to $200,000,000 during the year which ended with the month of June, 1920. It may be argued that these figures include the value of goods made from skins and hides other than those of cattle. While this is true, attention is directed to the fact that in the fiscal year 1919 exports of belting, sole leather, and upper leathers made from cattle hides reached the total of $104,000,000, while during the same period boots and shoes, made largely from cattle hides, were exported to the value of $78,000,000. It is safe to deduce from these figures that the total value of the leathers manufactured from cattle hides exported in 1919 at least equaled the value of the cattle hides imported during the same year.

It is seriously contended by the advocates of free hides that the cattle grower will not receive any protection from this proposed duty. The stockmen of the West have not constituted these leather trusts and boot and shoe men their guardians to say what is best for their interests. As a class, the stockmen are broadminded, intelligent, and capable, and when they assert, as they do, that the duty on hides does affect the price of their steers, they are, as the real parties at interest, entitled to first consideration. A large percentage of all range cattle are branded. Anything that injures the hide reduces the value of the animal wearing that hide. This can readily

iderstood if one will glance at the reports of the hide and leather journals and market iblications generally, which give quotations upon live stock, meats, meat products, id by-products from all sorts of food animals. It will be found that branded steer des are invariably quoted at from one to several cents per pound under the price those not branded. Furthermore, the cow and bull hides are never as valuable the market as steer hides. Therefore, it follows that the animal whose carcass is vered with a better hide is of more value to the buyer than the others mentioned. ll hide values depend upon size, sex, and condition.

The stockman contends that the value of the hide is a most important factor in e market value of his live stock. It is presumed that the country will soon return normal conditions. When that time comes the hides of cattle, which average from to 7½ per cent of the total live weight of the animal, the per pound value of the hide ill be double that of the per pound value of the animal, making the total value the hides 13 to 15½ per cent of the gross value of the animal. Hence it will be seen at the producer of the hide, if this duty is levied, will receive approximately from .50 to $2.50 protection. There are more than 10,000 people actually engaged in e live-stock business exclusively, with 6,000,000 farmers and dairymen engaged cattle raising to a larger or smaller extent. It is for these 6,000,000 farmers and irymen and the 10,000 stockmen for whom we ask this protection, and we contend at those for whom we make this plea are as much entitled to consideration as the ot and shoe manufacturers and independent tanners, whom they outnumber 20 1.

CONSUMERS.

Assuming that the country will return to normal conditions in the near future ese estimates will serve to maintain our position:.

From 1½ to 2 pounds of dry hide will be required to furnish the leather for an erage pair of men's shoes. The average value of 1 pound of raw hide is in the ighborhood of 15 cents. The duty on a pound of raw hide, assuming it to be valued 15 cents and the duty to be 15 per cent, would be about 2¼ cents, and for 2 pounds cents. In other words, the amount of the hide duty on an average pair of shoes ould range from 2 to 4½ cents. Compared with a large benefit to a great population gaged in one of the basic industries of the country—assuming that this whole amount ould be paid by the wearer of the shoes—it is so insignificant that the wearers of the oes have never been and never will be heard to complain. But, as a matter of fact, can not be shown that this 4 cents has ever been added to the price of a pair of oes during the period when a duty was exacted on the importation of foreign hides, id certainly it can not be shown that 4 cents or any fraction thereof has been subcted from that price since hides have been on the free list.

Assuming that the importation of hides will continue at the average of importation ring the past 10 years, and that a duty of 15 per cent will be placed upon those des, then the revenue received by the Government from this source will amount $13,000,000 per annum. Based upon the exports of leather boots and shoes manutured from imported hides, the drawback allowed—if that drawback is to be conued in the new tariff—would amount to about one-fourth of the import duties, or, round figures, $3,000,000 per annum. If we allow two pair of shoes per annum for ery man, woman, and child in the United States, which admittedly is a liberal timate, and if we consider that the imposition of an import duty would increase the st of these shoes by the whole amount of duty upon the proportion of the hide tering into the manufacture of these shoes, or 4 cents per pair, the total tax per pita would be only 8 cents per annum, or an aggregate of $8,480,000 for the 106,000,000 habitants of the United States, leaving a balance of more than $1,500,000 per annum revenue after the drawback is allowed and the consumer of the shoes has paid the x.

The total absence of any solicitude on the part of the manufacturer toward the nsumer of his product evidenced by the prices exacted in dollars is in painful ntrast with that manifested toward them on account of the few pennies collected contribute toward sustaining a great and absolutely necessary industry of this untry.

SHEEP PELTS.

The reasons given for a duty on cattle hides apply with equal force for a duty on sheep pelts, and therefore we deem it unnecessary to make a special argument covering that branch of the live-stock industry.

The American National Live Stock Association, The Cattle Raisers' Association of Texas, The National Wool Growers' Association, The Corn Belt Meat Producers' Association of Iowa, The Kansas Live Stock Association, The Colorado Live Stock Association, and all other live stock producing interests.

To the Committee on Ways and Means:

At the oral hearing before this committee on January 25 leave to file this brief on behalf of the live-stock interests was granted by the committee.

We have prepared the brief from the best available data obtainable within the time afforded, condensing and excerpting from official statistical and other reports by condensing the illustrative points, making reference to the source of the information. The data are to be found in the documents referred to, so that those desiring to do so may examine into the more comprehensive statements in support of the propositions here presented.

The oral statements and arguments of S. H. Cowan, J. H. Mercer, and A. W. Rucker were presented on the 25th day of January, before the full committee and printed in its proceedings, to which reference is here made.

As other data and compilations may be available so as to afford opportunity for collecting and presenting additional facts, we desire now to reserve the right, if the committee will so order, to file a supplemental brief in addition to what we here present, at as early a date as can be done and within such time as the committee may fix. We are led to make this request because, after being notified of the fact that the committee would hold the hearing referred to, it was impossible to prepare and present a brief before the oral argument and because we expect to be able to present facts in addition to those contained in this brief for the further information of the committee.

We have not been able to assemble the data as to hides but will present a supplement on that item.

We propose a tariff on frozen and refrigerated fresh beef and mutton of 20 per cent ad valorem with a minimum of 4 cents per pound, as essential to the continued production of meat animals in the United States to supply the consumption and to assure a home market for the same, which is absolutely and undeniably essential to the prosperity of farming and stock raising. We are not dealing with normal conditions nor can they soon be restored; and they can not be restored at all without protecting the American stock raisers and farmers in the preference to the home market for consumption of meat food products and particularly beef and mutton, and in addition to that (which is presently most urgent) the other animal food products, wool, hides, including mohair and pelts. We insist that when the fire is burning it must be put out and then consider preventive measures against the recurrence, instead of devoting first our efforts to provide the permanent remedy that may be made to fit normal conditions not now in sight. First aid to the injured and burial of the dead is the first duty of the people's representatives for the salvation of the survivors.

To our view, and it is imperative, the remedy must relate directly and immediately to existing conditions, which if continued must grow worse.

Who shall furnish our meat and bread? Shall it be from the toil and industry of Americans, who should be afforded an opportunity for modest profits, or by foreign production that impoverishes our own overburdened producers? The consumer is as much interested as is the producer. There are not two classes, producers and consumers, in considering these great economic problems lying at the very foundation that supports the superstructure on which the prosperity and development of the country rests. All producers in the workshop or in the fields are consumers and spend their money derived from their industry for what they require, and the bankers, merchants, traders, and professions are always dependent on the basic business of the country, sharing in its prosperity or adversity, in the long run. We can't reason with the man so selfish as not to favor home production to the extent of affording opportunity for a fair profit to the producer on the basis of "live and let live" and progress as the watchword. At the outset let it be understood, and let that understanding be maintained throughout, that the meat products are not supplied by the producers, nor do they possess the possibility of fixing the price to the consumer.

ey have nothing to say as to the price received for live animals sold by them for ughter. Neither is there competition from abroad in the importation and sale of ats. Is there any class of people in this country, which, under existing conditions, th any feeling for the country's good and prosperity, would hesitate to say that nerican stock raisers and farmers shall have a fair preference in the home markets consumption?

In the assurance to the people of this country that a bounteous supply of the best ats will be produced at home and the money kept here, and the stock raiser and mer have a fair return for their labor and industry, lies the foundation of the Na- n's wealth and prosperity. The same manufacturers, the American packers, nish the meat supply and have the means of transporting and handling the fresh ats, without competition with others of substantial sort. In this it is wholly dif- ent from other commerce. The American meat packers undeniably control the ports and imports of frozen and refrigerated beef and mutton and exclusively carry that business for this country, and they did that both when there was a tariff and en these products could come in free of duty. There is no use, therefore, to in- lge in speculation as to any possibilities of it being otherwise. You are dealing with ings, not fancies, and the live-stock producers are facing facts and not theories, d these facts are to-day ruinous. We are not posing as advisors of the packers; ey do not need it, nor has the stock owner the vanity to suppose that he knows how operate or direct the operation of so great a business, but it may be here stated that eir greatest asset is the supply of live stock sufficient to meet the consumption of is country to be here produced, manufactured, and sold. Whether they do or do t desire to have our markets available free of duty for dumping the suplus of their ants in other parts of the world, when other markets for the products are less desir- le or less profitable than ours, the power to do it is a constant menace to the pro- cer here who can not meet the cost of production of other surplus-producing coun- ies, subjecting the stock raisers here to the lowest level of prices, which under free de is entirely in the American packers' control. Without a substantial tariff to otect this home industry the increase in importations wholly at the will of the merican packers, will grow as the profits in the same stimulate the importation, til at last this country would be dependent on the foreign production for its meat pply, just to the extent that the American packer may make it. This is no pipe eam; it is the inevitable result without the relief we demand. But let us suppose at under world conditions to-day the American packers do not desire, that is to y, it would not be a profitable policy to dump the foreign meats into this market take the place of what we produce. Is it not true that if our markets are available d desirable, others would engage in such importations and so divide the trade that ntinued low prices for live stock and the hopeless condition would exist to destroy e live-stock producer? Once that condition, which stares us in the face, arises, e consumer, so called, would be worse off as time should go on till the lessened pro- uction here and the control by a few concerns of the trade would keep up the prices the consumer to the highest level. Remember, you can not plant a crop of eers to raise for meat and increase or decrease production as you will. Once ut out of the business the producer would be a fool to go back in. Therefore, even om the packers' viewpoint (and we have no information as to what that may be) e tariff which we propose would not work an injury to them in the long run.

It follows that producers, consumers, packers and all others have in this matter like interest, differing perhaps only in degree.

Then there is the general public interest in the development of the country and the rtification of the soil, which it is universally known must be kept up by live stock it must disappear; and finally with it the production of grain much reduced, till, ith rapidly increasing population, we will produce less bread than we consume. hen that day comes poverty will have overtaken us. No one can be hurt and every e entitled to it will be the recipient of the benefits of the tariff we propose.

The stimulus of the war upon the production of live stock and meats naturally llowed the increased prices and profits where conditions and cost of production d their effect. But for that, beginning as it did almost concurrently with the free de in meats, the production of live stock in this country sufficient for the country's eds would not to-day exist. The extension of the operations of the American packers the surplus-producing countries, where production was cheaper, was growing and continued to grow during the war. When the war ceased and European demands ere to be supplied but in far less amount, the trade was turned to our markets, not used by extensive commercial opportunities, but solely by the American packers a use for what could not be sold more profitably elsewhere. For example, the exports

of fresh beef were 480,179,681 pounds during the first 11 months of 1918, the last ye of the war, but fell to 88,101,986 pounds for the 11 months of 1920.

Labor and cost of the use of land, the cost of feed and every item of supplies an materials, the cost of transportation and of marketing has not in this country be reduced, but, upon the whole, increased, with no prospect of soon being reduced, wi the single exception of feedstuffs, and even that is more apparent than real, becau of the cost of producing and cost of transportation and handling.

So that our cost of production of beef and mutton is enormously greater than in a other surplus-producing countries, as it must continue to be until only the most fav ably situated producer can remain in business, with our total production reduced below our consumption. With that condition the control of the price to the consum necessarily must rest with the importer. The fact that the surplus trade has been rapidly turned to this country and the fact that right here in the city of Washingt at this time New Zealand frozen lamb is sold at a price of 7 cents below Ameri refrigerated lamb by the same packers handling both through their cooling and stor houses, proves far more as to the difference in cost of production than statistics or oth evidence available; indeed, dispenses with the necessity of further proof for the pu poses of convincing a man of common sense of the exigency that calls for all the rel we demand. The available facts as to cost of production relating alone to the cost labor and grazing is amply sufficient. We submit elsewhere statements.

It has been asked whether or not the imposing of a tariff upon the food produ which come into competition with the products of the United States increases the c to the consumer. Partly in answer to this, the facts do not bear out the idea that tariff duty is borne by the consumer but that it simply acts as a protection agai the flooding of the market with foreign produce, and to bear out this reasoning committee may take the wholesale price of beef in the spring of 1911, as shown by published reports of Swift & Co. in the daily newspapers of Washington and which printed in the hearings on House bill 4413, sixty-second Congress, first session be the Ways and Means Committee, May 15 and 16, 1921. Those figures show that spread of wholesale price on dressed beef in the city of Washington ranged between cents per pound on the 30th day of April, 1910, to 8.92 cents per pound on the day of April, 1911, and this under a tariff of 1½ cents per pound. Intermedi prices arose from 1914 until 1920 from the same source, namely, the newspapers lished in the city of Washington, the spread of wholesale price of beef from April to December 24, 1920, shows a range of from 13.49 cents per pound to 25.57 cents pound during which period meats could be imported free of duty, and were so import and this 18 months after the armistice was signed so that the war demand could have affected the prices. It does not appear that the retail price, of which we all aware, follows the wholesale price. As a matter of common knowledge, it does

PRODUCTION, EXPORTS, AND IMPORTS OF MEAT ANIMALS AND MEATS.

There are no means available by which an absolutely accurate statement total slaughter of meat animals in the United States can be ascertained for the that in many communities, especially in the rural districts and in small villag farmer and the local butcher slaughter animals from time to time of which no r whatever is kept, but the Department of Agriculture, Bureau of Animal Indu has published tables from time to time giving the total number of animals tered as estimated by the bureau office. One of these is entitled "United Meat Production," etc. Calendar years 1914 to 1919. From Table No. 1 pamphlet it would appear that in 1914 there was slaughtered a total of 11, cattle, of which 61 per cent were inspected by the Federal authorities. In the year the slaughter of calves amounted to 4,661,400 head; sheep and lambs, 18,40 and goats, 499,000. Compared with these figures the report shows in 1919, the available, the total slaughter as follows: Cattle, 13,635,100; calves, 9,041,0 and lambs, 16,460,600; and goats, 247,500.

Table 3 of the pamphlet on meat production from which the above figures are shows that the total pounds of beef, mutton, and lamb (including goats) sla in 1914 was 6,811,041,000, compared to the total of 7,056,892,000 pounds in 1

The meat production in the surplus-producing countries—Australia, South A ica, and South Africa—can not be ascertained except as reflected by the live produced and exports of meats.

In 1914 our total export of pickled, fresh, and canned beef, veal, mutton lamb (including goats, which is negligible) was 89,803,753 pounds, which in creased in 1915 to 379,790,966 pounds, and the peak of the exports of these ducts was reached in 1918, when the aggregate was 701,627,527 pounds. In

the last year for which full reports are available, exports fell to 273,971,892 pounds. From the same source (Table No.4) it is shown that in 1914 the United States imported a total of 274,076,922 pounds of fresh beef, veal, and mutton (reexports not included) and that in 1919 the total imports had fallen to 45,266,059 pounds, exclusive of reexports. In the year 1920 the total imports of meat into the United States exceeded by 40,000,000 pounds the combined export of American meats and foreign meat products reexported according to the information furnished us by the Tariff Commission.

The Bureau of Markets of the Department of Agriculture reports that 58,725,460 pounds of imported beef were inspected by the Bureau of Animal Industry during the calendar year of 1920.

During the year 1920 there was imported and inspected by the Bureau of Animal Industry 102,441,737 pounds of mutton and lamb as against 8,472,110 pounds of mutton and lamb imported and inspected during the calendar year of 1919.

Inquiry at the office of one of the wholesale establishments in the city of Washington indicates that the price of New Zealand frozen lamb is on the average of 7 cents per pound lower than the price received for American dressed lamb carcasses.

It is most significant, and to live stock producers an alarming fact, that after the war, which afforded a market for all live stock products regardless of free trade, and kept out imports from this country, that immediately when the war was over our exports fell so rapidly that in two years we have so changed that our imports of meats exceed our exports, and if continued, as it will be under free trade, in rapidly increasing volume, our live stock industry will soon be ruined.

It is not a political question. Plainly it is a question of producing our own meats or buying them from our packers imported from their plants in other countries.

This brings out in bold relief that the consumer is as vitally interested in our home production as is the producer.

The Bureau of Markets furnishes us the information that the amount of frozen domestic lamb and mutton in storage January 1, 1920, was 10,289,780 pounds. One year later, or on January 5, 1921, there was in storage 82,000,000 pounds, while the greatest supply of frozen lamb and mutton in storage previous to 1920 was 12,500,000 pounds. From this source it was learned that there were imported into the United States on the fifth day of January, 1921, on the steamships *Kent* and *Lietrim*, 270,262 carcasses of lamb and mutton, having a total weight of 13,875,032 pounds; also, that three more cargoes are en route to United States ports.

We submit the following tables showing the production of meat animals, and exports and imports by countries, for the purpose of showing to the committee the world trade as it relates to the competitive production and marketing in the United States; exports from the United States to foreign countries, and from foreign countries to the United States. The object is to supplement the argument presented that the indisputable fact, as shown by the actual figures as nearly as they can be ascertained, that, unless there is imposed a sufficient tariff to prevent it, the United States will cease in the course of a comparatively short time to produce the meats which it consumes and will be a consumer of the surplus products of the foreign countries which produce a much larger proportionate surplus, as related to the population of such countries, than is produced in the United States. The surplus which will be imported from other countries and sold in this country will necessarily take the place of the home production and reduce the price level, should it be desired by the importers of the carcasses imported, to such figure as to keep down the value of the home production, which must inevitably lead to a continual decline in production.

At the risk of repetition of what was presented in our oral statements and submitted elsewhere in this brief, we desire to call attention at this point to the fact that the United States now has 640 cattle and 345 sheep per thousand of population, whereas the other surplus producing countries have the following: Argentina, 3,120 cattle and 5,450 sheep; Australia, 2,220 cattle and 16,100 sheep; New Zealand, 2,490 cattle and 22,110 sheep; Canada 1,200 cattle and 380 sheep; Paraguay, 5,280 cattle and 600 sheep; and Chile, 500 cattle and 1,180 sheep, per thousand of population.

The cost of production in the countries named, as shown in the part of this brief under that heading, is so much less than in the United States that there is no comparison, and no tariff short of an embargo could be made to equal the difference.

The remarks submitted here in connection with the tables which follow emphasize the correctness of the conclusions in the foregoing argument as demonstrated by these tables, which are the most reliable data obtainable. The tables are as follows:

Live-stock estimates for the United States as of Jan. 1, 1910–1921.

Decrease in pork	439,699,753	....
Increase in lamb and mutton	20,973,165	....

Full data as to the production of meat and meat-food animals in the countries producing a surplus are of necessity incomplete, but the latest figures available, as shown by Circular No. 38, Bureau of Crop Estimates, of the Department of Agricult

issued on the 15th of October, gives the following as the number of live stock in the countries named on the dates specified. The bureau in publishing these figures makes this explanation:

"*Live stock.*—Although statistics exist showing the number of live stock in the different nations of the world, the figures in many countries are not for uniform dates, relate to different years, and even to different seasons of the same year. To make an accurate or even satisfactory summary of the numbers in the whole world in any given year or in any given season is, therefore, impossible. From the figures relative to the different countries in the following tables and pertaining to prewar estimates it may be reasonably inferred what the normal numbers were before the war."

Number of live stock in specified countries.

Imports of fresh meats, 1914 to 1920.

The United States became an importer of fresh meats first in 1914, following the enactment of the law placing meats on the free list. Importations of such meats during the past six years, as shown by the reports of the Bureau of Foreign and Domestic Commerce, Department of Commerce, were:

		1914	1915	1916	1917	1918	1919	1920
Meat products—meats, fresh:								
Beef and veal	lbs.	254,319,200	118,589,580	39,772,414	22,072,147	23,339,081	38,461,758	50,182,105

The following summary so well illustrates the situation as to foreign meat production in 1919 that we submit it for the consideration of the committee.

FOREIGN MEAT SITUATION.

[Price Current—Grain Reporter, May 8, 1919, p. 40.]

The annual review of the frozen-meat trade of the world by W. Weddel & Co., of London, was issued, bearing date of April 1, 1919, from which it appears that during the year 1918 approximately 600,000 to 700,000 tons of frozen meat were shipped, mainly from the Western Hemisphere, to the armies in Europe, Egypt, and Salonica. The great bulk, however, entered Europe through French ports. Italy took about [illegible]65,000 tons, the bulk of which came from the River Plate and Brazil. This compares with 96,800 tons for the year 1916. The export from Australia in 1918 was the smallest recorded for many years, amounting only to 66,900 tons compared with 118,540 in 1917 and 171,200 in 1914. The bulk of this meat was beef, only 7,900 tons in 1918 having been of mutton and lamb, showing that the sheep farmers of Australia are in difficulty but are making strong efforts to overcome the very serious losses of stock suffered during the preceding years, particularly 1914 and 1915, when sheep were reduced, it is said, by the enormous total of 16,000,000 head and cattle by 1,000,000 head owing to adverse weather conditions. Recent estimates place the number of sheep now in the Commonwealth at 78,000,000 head and cattle at 10,500,000. The sheep are about [illegible],000,000 above the low-water mark of 1916 but are still 7,000,000 under the total of 1913.

The same trade for New Zealand, once a very heavy shipper of frozen mutton, was affected by the general scarcity of refrigerated tonnage. The sheep in the Dominion of New Zealand on April 30, 1918, were computed at 26,500,000, an increase of 5 per cent over the previous year; the number of cattle, 2,900,000, an increase of about 125,000 during the year.

The report calls attention also to the fact that French herds and flocks, which were seriously reduced by the German invasion and by the excessive killing during the early parts of the war, are making good progress toward recovery in respect of numbers, although of course in the matter of weight they are still light owing to the scarcity of feeding stuffs. The report says no fresh enumeration of live stock in the Argentine Republic has been made since 1917, when approximately there were 30,000,000 head of cattle and 55,000,000 sheep. The year, however, was an excellent one for stock, and it is unofficially estimated that there was a net increase of between 6,000,000 and 7,000,000 cattle and about 4,000,000 sheep.

Brazil is estimated to have about 30,000,000 head of cattle. The herds, however, consist largely of calves and young animals, many of which are not yet of suitable weight and quality for export, although there is regularly considerable beef exported from Brazil, both frozen and chilled.

COST OF PRODUCTION IN FOREIGN COUNTRIES.

From the Pan American Union it is learned that the highest rate of wages on the farms in South America, including all kinds of farm labor, is $20 a month and board. The rates are given by the Pan American Union on the basis of the pay in the year 1917, or at the height of the high wage rate throughout both North and South America. According to the figures on file at the Pan American Union the rate of wages was as follows:

Brazil, from 50 to 90 cents a day without board.
Argentina, from $10 to $20 per month and board.
Paraguay, about the same rate as Argentina.
Uruguay, wages corresponding to those paid in Brazil.
Chile, 25 cents a day.

On the best obtainable advice the rate of wages among the sheep and cattle herders in Australia and New Zealand ranges between $25 and $50 a month and supplies. In South Africa, which is rapidly becoming a great sheep-producing territory, wages are reported averaging $7 a month and a few pounds of meal and a few ounces of salt per diem.

The freight rates on frozen beef, mutton, and veal from Australia and New Zealand to the Atlantic ports of the United States range from 1¾d. to 1⅞d. per pound, or at the current rate of exchange 2¾ to 3 cents per pound from the sheep and cattle ranges of Australasia to the American Atlantic ports, either around the Horn, by the Suez Canal route, or through the Panama Canal. At the time this is written the Shipping Board reports the current freight rate on frozen meat from Argentina and the River

Plate country as 4 cents per pound. Against these rates the American producer is faced with the following rates:

	Per 100 lbs.
From Omaha to Boston or New York	$1.34½
From Kansas City to Boston or New York	1.34½
From Fort Worth to Boston or New York	1.[illegible]
From Chicago to Boston or New York	.96½

As to the rate of wages, the difference in favor of the American herder is at least 100 per cent as compared with the most favored of the other surplus producing countries. American farm-labor wages during the past three years have ranged from $45 per month and board up as high as $90 per month and board. From these figures it will easily be understood that the labor cost of production in the United States is at least 100 per cent higher than it is in any one of the other surplus producing countries, either in the Western or the Eastern Hemisphere.

We do not submit here any particular figures with respect to the cost of production in this country, but from the foregoing it will be seen that the wages in the foreign countries mentioned are so much less than the wages paid in the United States, and the labor is performed under such different conditions and circumstances, with a lower overhead cost, that it is impossible to state in figures a reasonable comparison. But it is plain, and not open to the suspicion of doubt, that labor costs several times more in the United States than it does in these foreign countries.

On the subject of the cost of grazing live stock, and feeding and fattening the same for the purpose of slaughter, reliable data are not available. But inquiry of those who have observed it, and of those who are closely connected with the production in these countries, leads to the undeniable conclusion that the cost of grazing, feeding, and fattening of live stock, as it is carried on in those countries, apart from the matter of labor cost, is very much less than it is in the United States.

The very fact that the American meat packers themselves have established slaughtering plants at the points of export in most of these foreign countries is ample proof that the supply is available at a much lower price. We expect the Tariff Commission to complete a compilation of the data gathered by it before these hearings are concluded. This will be submitted to the committee for its information. We do not care to indulge in the submission of such facts as we have been able to gather, which are of a less specific nature and would only tend to confusion, and, indeed, would be eliminated when the report of the Tariff Commission is submitted. We could refer to examinations which have been made in previous years and reports respecting the cost of grazing and the method and manner of carrying on the business in these surplus producing countries, but the later reports of the Tariff Commission will likewise doubtless be substituted.

One significant commercial fact is important to bear in mind, and that is, if the importations from these foreign countries are permitted to come into the United States and to take the place of our home production and thus produce, as it inevitably will, a lessened home supply year by year while the market for the foreign product continuously grows, as it would, it is certain that the consumer will be supplied only from the hands of the very same packing interests, who are slaughtering in foreign countries and importing into the United States and who also slaughter in the United States the home production. This would likewise extend to the exportation from foreign producing countries and from the United States of whatever surplus may exist to the foreign consuming countries; all handled by the same interests.

Plainly, it is not a case of ordinary sort wherein an import duty is made with respect to an extensive commerce by great numbers of people who may engage in it.

The nature of the business of the slaughtering, refrigeration, and transportation of fresh meats, and indeed canned and cured meats and the by-products, is such that it is capable of being carried on most economically by concerns prepared to handle it throughout the most extensive world commerce, involving the necessity of large expenditures and a large organization of operatives skilled in the business. These things are mentioned simply to show that the field of this commerce is occupied and that there would be little, if any, invitation to outside undertakings on the part of capital of a competitive nature.

So that this committee is dealing with the import tariffs upon the meat products of a few concerns, concentrating into their hands the surplus meat products of the world.

It follows that the argument is unsound wherein it is contended that the consumer can benefit by the importation into this country, which would mean lessened production here, where home slaughter can be extensively engaged in if the supply is ample. The consumer can not profit by the curtailment of the home supply, and it has been clearly shown that he has not profited by the importation of meats free

ty. The commercial result of the failure to provide for a duty on imported fresh eats will be to continue the control of the supply of the imports in the hands of ose who now control the imports and largely the home production.

It is against the interests of the consuming public of this country to thus curtail e production of meat animals in the United States.

The American National Live Stock Association; The Cattle Raisers' Association of Texas; The National Wool Growers' Association; The Corn Belt Meat Producers' Association of Iowa; The Kansas Live Stock Association; The Colorado Cattle and Horse Growers' Association and All Other Live Stock Producing Interests; S. H. Cowan, Fort Worth, Tex.; A. W. Rucker, Denver, Colo.

Mr. Cowan. I have a statement of Col. Ike T. Pryor, which has een given wide circulation in the press. He is a man of very great perience, vice president of the Southern Tariff Association, and as been president of the American Live Stock Association and many ther organizations, is well known throughout the United States, and think it is valuable. It consists of but three or four pages on the ubject of the cost and the tariff.

The Chairman. It will be printed.

TATEMENT OF IKE T. PRYOR, SAN ANTONIO, TEX., REPRESENTING AMERICAN NATIONAL STOCK ASSOCIATION AND THE TEXAS SOUTHWESTERN CATTLE RAISERS' ASSOCIATION.

There are two great internal questions before the people of the United States to-day, riff and revenue. They are very closely allied. It is hard to discuss one without e other. Some claim the tariff to be a local issue, others claim it to be a political sue, while some will say it is an economic issue. Call it what you will, it is a big uestion, and is going to take big-brained and broad-minded men to handle it.

The tariff affords a degree of protection and at the same time produces a revenue, us reducing our tax burden just that much; and the less taxes we pay the more cash e can lay aside for a rainy day.

COST OF PRODUCTION.

We talk about a tariff of at least sufficient amount to equalize the cost of production ere and abroad. Who knows or can find out the exact cost of production? Take e cattle business, for example. It costs less to produce a beef in south Texas ready r slaughter than it does in north Texas. It costs less to produce a beef in Texas an in Nebraska; and less in Kansas than in Illinois. One year it can and does often st 25 to 50 per cent more to care for an animal than the previous year or the year llowing; hence, the cost of production will vary all over the United States, according local conditions, etc.

We should place a tariff sufficiently high on live stock and the products of live ock to cover the cost of production compared to that of foreign countries, plus a asonable profit, and at the same time not so high as to create a monopoly.

We should not ask for favors in any form but to oppose favoritism in all its forms. t is asking no favor to put us on an equal footing with foreign importers, and when e don't receive that consideration from Congress then the favor is extended the reign producer of raw material and not the home producer, which is absolutely nfair.

To better understand the importance of protecting our live-stock producers by a roper tariff, the following statistics should be studied carefully.

Population, and number of cattle and sheep.

	Population.	Cattle, prewar period.	Cattle, recent estimates.	Sheep and lambs, prewar period.	Sheep and lambs, [illegible]
Argentina	8,284,000	25,867,000	35,000,000	81,485,000	[illegible]
Uruguay	1,379,000	8,193,000	7,802,000	26,286,000	[illegible]
Brazil	26,542,000	30,705,000	37,500,000	10,653,000	[illegible]
Australia	4,971,000	11,745,000	11,040,000	92,047,000	[illegible]
Total	41,176,000	76,510,000	[1] 91,342,000	210,471,000	[3] [illegible]
United States	106,653,000	61,804,000	[2] 67,966,000	52,448,000	[4] [illegible]

[1] Increase, 19 per cent. [2] Increase, 9 per cent. [3] Decrease, 8 per cent. [4] Decrease, 4 per cent.

The four competitive countries first mentioned are known to consume less [illegible] per capita than our people and their population is less than 40 per cent of that [illegible] United States, yet they raise nearly 40 per cent more beef and four times as [illegible] mutton as we do, and consequently export the bulk of their meat.

Argentina has more than 4 cattle and 10 sheep per capita, while we have but [illegible] more than half a beef and less than half a sheep per capita. The great market[illegible] this country are in large cities, most of which can be reached by water transportat[illegible] In other words, at least one-third of American people to-day can be reached [illegible] foreign countries by water transportation, and when the great canal is built, [illegible] will connect the Lakes with the Atlantic Ocean, thus permitting ocean-going [illegible] to reach Chicago, one-half of the American people can be fed by water transporta[illegible] from foreign countries.

From the Pan American Union statistics it develops that farm laborers in Arge[illegible] receive $10 to $20 per month and board, so it is plain that, with our farm labor [illegible] paid from $45 to $90 per month and board, our labor cost of producing meat is [illegible] than four times as great as Argentina.

It should also be considered that these competitive countries still have enor[illegible] tracts of free range, and the cost of raising cattle is much less than here. Land [illegible] and pasture charges are much lower there than in this country and there is [illegible] an item of expense incident to the live-stock business that is not very much le[illegible] competitive countries than here.

Live-stock receipts at market centers declined more than 10 per cent in 1920 a[illegible] pared to 1919. On such a decline in receipts why didn't cattle, hogs, and she[illegible] crease in price? The answer is, imports of meats free of duty in various forms [illegible] the slack and prevented the advance; on the contrary, pressed the market down [illegible] Cattle led in the decline of agricultural products in 1920 and the price has been [illegible] toboggan ever since. Each month live stock has dropped a little lower than th[illegible] vious month, until now $8 per hundred live weight looks as good to us as did $1[illegible] hundredweight in the spring of 1919; thus decline in price carried with it little [illegible] benefit to the consumer, as the producer does not fix the price to the consumer [illegible] commodity.

Out of $4,000,000,000 estimated necessary to run this Government for one yea[illegible] 15 per cent of this vast sum is collected at the customhouses on import du[illegible] balance, or 85 per cent, is from internal revenue. This is the result of the work[illegible] the Underwood bill. Under the Payne-Aldrich bill 65 per cent of all the re[illegible] necessary to run this Government was collected at the customhouses on import [illegible] balance of 35 per cent was collected from some internal source, a great deal of [illegible] was from whisky and tobacco tax; however, it required only about $1,000,000,000 [illegible] those days to run the Government, as against $4,000,000,000 to-day.

MUTTON AND LAMB IMPORTS.

During the 12 months ending June 30, 1920, there were imported free of [illegible] 16,358,299 pounds of mutton and lambs, and during the succeeding four months imports of mutton and lambs free of duty amounted to 64,623,777 pounds, [illegible] 80,982,076 pounds.

During the last four months of this period there were practically four times as m[illegible] of these imports as in previous 12 months.

Putting the average mutton carcass at 40 pounds, it means there were the equi[illegible] lent of more than 2,000,000 sheep brought into this country free of duty during [illegible] 16-months period, and of this number three-fourths, or 1,600,000 head, arrived [illegible] the short period of the last four months, including February.

BEEF AND VEAL IMPORTS.

More than 100,000 carcasses of beef and veal were also imported into this country ree of duty in the last 16 months, making a total of over 3,000 carloads of cattle and ibout 10,000 carloads of mutton and lambs. This vast amount of meat was brought nto this country in ships which entered our harbors without the expenditure of one ingle dollar in this country before it reached our large consuming centers. When old at least 95 per cent of the proceeds were returned to some foreign country, practically little or no benefit to our commerce in any way. This is the direct result of no duty.

What if this 3,000 cars of cattle and 10,000 cars of mutton and lambs had been marketed from our farms and ranches in this country? Our railroads would have eceived freight on 13,000 cars of cattle and sheep. The charges for switching and eding the cars, feed, yardage, attendance, war tax, also a commission charge, ould have been distributed among the various interests named, and finally, and ost important, the net proceeds would have been deposited in our home banks r applied on some hard-pressed cattle or sheep man's paper. This would be the esult of a protective duty on imports. Which do you want and which will do the ost general good? It does not take a Solomon to answer the question.

Had it not been for the World War the Underwood bill would have wrought destruction to agriculture, also brought grief to the Democratic Party. Immediately after is Underwood bill was passed dressed or frozen beef and mutton began to be diverted om Europe to this country in large and increasing quantities. Only the war and he great demand for meat in the war zone gave us temporary relief from the imports om South America. Shortly after the armistice was signed these great foreign ean-going vessels began loading not only meats but other agricultural products in eat and increasing amounts. On January 5 of this year two ships reached the nited States loaded with 270,262 carcasses of mutton, and three other foreign ships ere en route to this country loaded with mutton. Five ships in one month containing about 675,655 carcasses, or 34,687,580 pounds, of meat coming in free of duty a staggering blow to the meat producers of the United States.

NO MILLIONAIRE FARMER.

We have in the United States 20,000 millionaires, judging from the income-tax cords. This estimate is based on the assumption that each individual who pays xes on an income of $50,000 or more is the owner of a million-dollar estate, and it is ry probable this estimate is a conservative one.

More than 6,000 of these millionaires live in New York State and probably 90 per nt of the others live north of the Mason and Dixon line and east of the Mississippi iver. How many of these men made their millions in farming? Who ever heard an honest-to-God millionaire farmer? How did most of these millionaires make eir money? The answer is, in the manufacturing business. Who furnished the w material for their plants? The live-stock raiser furnishes the cattle, sheep, and gs from which they produce beef, mutton, and pork to feed the world; they furnish e hides and wool, which the manufacturer converts into leather and cloth to shoe d clothe the world.

The farmer furnished the cotton from which the manufacturer creates cloth to make othing for the people; they also furnish the grain from which to create flour, meal, d cereals to feed the people.

Here is exhibited a community of interests, one absolutely dependent on the other, hich should be a 50-50 proposition instead of—well, I can't even guess what per nt the farmer and ranchman receive for their so-called raw material as compared th what the manufacturers receive for the finished product.

Fortunately our worthy President, Mr. Warren G. Harding, in his inaugural address id

"Tariff must be adjusted to protect American industry, with its higher production ts against people who are seeking trade expansion."

In so expressing himself President Harding meant by the expression "American dustry" not only manufactured products but everything produced by industry, it is up to us to so impress upon our Congressmen the needs of our farmers and kmen that we, too, will receive proper consideration in the remodeling of our tariff.

The manufacturers are highly organized, and you may depend upon it they will, rough combined efforts, obtain all possible tariff protection.

Every stockman and farmer in the South should take a keen interest in the tariff estion and become active members of live-stock or agriculture associations. You

should also actively assist the managers of your associations by urging your Congress-men to take an active interest in legislation affecting your products.

President Harding is in sympathy with us; so, I repeat, get after your Congressman and see that all possible facts and figures are available for him to show other Congress-men the importance of protecting the American farmer and stockman, especially of the South, whom you should represent, to the greatest possible degree.

Mr. COWAN. I have some memoranda made in connection with importations of hides, taken from the census, that I should like to have printed as a part of my original remarks, not as an appendix.

The CHAIRMAN. Hand them to the stenographer, and they will be printed in that manner.

Mr. COWAN. In the foregoing argument mention was made at different places of statistical data to be submitted herewith as a part of my statement. I therefore submit the following:

First. A statement issued by the Bureau of the Census under date of Jun[illegible] 8, 1921, relative to the slaughtering and meat-packing industry for the year 1919, as compared with the year 1914, as follows:

A preliminary statement of the 1920 census of manufactures has been prepared by the Bureau of the Census, Department of Commerce, furnishing statistics concerning the slaughtering and meat-packing industry for the year 1919. It consists of a statement of the number and cost of animals slaughtered and the quantities and values of the principal products manufactured during the year 1919.

The figures are compiled from 1,305 establishments with products for the year valued at $4,246.290,000. The total cost of raw materials, principally live stock. was $3,774,901,000, or 88.8 per cent of the total value of products.

The statistics for 1919 and 1914 are summarized in the following table. Those for 1919 are preliminary and subject to such change and correction as may be necessary from further examination of the original reports.

Slaughtering and meat packing, wholesale—Census Bureau's summary for the industry—1919 and 1914.

	1919	1914

We have included in the foregoing tables live stock and meats only. Fig-ures are readily obtainable with respect to all the different classes of products but it is not deemed necessary or desirable to present them here.

It will be observed that there was nearly a 100 per cent increase in importations of cattle for the years 1913 and 1914 over the year 1912, and large increase in 1912 over 1911 and in 1911 over 1910. The peak was reached in 1913, when 736,937 head were imported, falling to 552,489 head in 1915, again reaching the high mark of 642,395 in the year 1919.

The exports for the same periods show a very small and generally insignifi-cant number, the highest number being 164,087 head for the year 1911. The low mark was 8,694 head in the year 1914. In 1919 the number increased to 69,859.

For the year 1921 the imports of cattle were 326,214 head, and the exports 145,673 head, so that the imports exceeded the exports by 180,541 head.

Fourth. Tables from the reports of the Bureau of Foreign and Domestic Commerce showing the imports and exports of calf and cattle hides for the year 1910 to 1921, as follows:

Wherever values have been left in the tables, it has been done only as a matter of convenient information. In the case of meats and other products it is, of course, well understood that conditions during the war and even up to this period have been too abnormal to make the value figures adaptable for the purpose of drawing deductions which are reliable.

Also the quantities of exports during the same period, which were affected by the war, can not be used for the purpose of drawing deductions as to what may be expected in the future. It is for that reason that we have presented the figures for the years before the war and brought them down to date.

Fifth. A statement compiled by Mr. John Roberts, of the Bureau of Animal Industry of the Department of Agriculture, concerning meat production, consumption, and foreign trade in the United States, 1907–1920, as follows:

MEAT PRODUCTION, CONSUMPTION, AND FOREIGN TRADE IN UNITED STATES, 1907–1920.

The accompanying tables show the trend for the last 14 years of the production, exports, imports, and consumption of each of the various kinds of meat in the United States. The data are based on two kinds of slaughter reports—(1) the complete slaughter in the United States taken by the census for 1909, and (2) the Federally-inspected slaughter, the details of which are published annually by the Bureau of Animal Industry. The combination of these reports affords a means of estimating the total slaughter from year to year. These estimates can not be made earlier than 1907, as that was the first year the Federal inspection was in operation on its present scale. Hence the tables begin with that year.

The slaughter reports referred to give results only in numbers slaughtered of each kind of animals. Average dressing percentages and average carcass weights are provided in order to convert the live animals into meat equivalents. An annual determination of these factors is necessary, because in some cases, especially with cattle and swine, the average carcass weights vary considerably from one year to the next.

The data throughout are computed from a dressed-weight basis. The edible offal (liver, pluck, etc.) is not included in the dressed weights and so is disregarded. In the aggregate it represents a large quantity of edible material, but it is more than offset by the bones and waste trimmings of the dressed carcasses. The figures in the tables, therefore, represent approximately actual meat. Lard is estimated separately from the dressed weights of swine.

The foreign-trade figures in the tables are taken from the December report of the Department of Commerce, which gives the calendar-year totals.

NOTE.—Slight changes have been made in the per capita consumption figures published previously for the years 1914 to 1919, inclusive. These changes have been caused by the corrections in the census-population figures following the taking of the 1920 census.

Number of animals slaughtered annually under Federal inspection and estimated number slaughtered otherwise (including farm) in United States.

A few horses are slaughtered under the Federal inspection, and probably more otherwise, the flesh being mostly used to feed wild animals in zoological gardens, menageries, etc. The Federal inspection of horses commenced in September, 1919, and 433 were slaughtered up to the end of the year. During 1920 the number slaughtered was 894. A large proportion of the inspected horseflesh is exported.

Estimated annual production, exports, imports, and consumption of beef in United States.

The trend of beef production, which was especially high in 1907 and 1910, declined steadily from the last-named year until the advent of the World War. The war production culminated in 1918 with the largest total on record. The effort, however, to some extent depleted the resources of the producers, and with other causes brought about a reaction during 1919 and 1920.

Exports of beef at one time formed a large and important branch of our foreign trade, but by 1913 they had largely disappeared and foreign beef began to come in. The exports were large from 1915 to 1918 solely because of the war needs and have since fallen away very noticeably.

Imports of meat previous to 1913 were so small that they were not enumerated separately in the commerce reports. Imports of beef in 1914, however, were quite considerable. At this period the sources of cheap beef in the Southern Hemisphere, especially Argentina, had developed enormously, and they had, in fact, supplanted the United States in the overseas trade with Europe.

Consumption of beef, as seen in the table, was at the lowest point in 1915, shortly after the advent of the World War. Restricted supply and high prices brought the next lowest consumption per head in 1920.

Estimated annual production, exports, and consumption of veal in United States.

1919	851	373	478	851	8.1
1920	909	382	527	909	8.5

Veal production, as a rule, follows that of beef. The unusually large slaughter in the last two years, however, contrasts rather curiously with the considerable decline in cattle slaughter in the same period. It is accounted for partly by the droughty conditions in the West, which induced heavy marketings of young stock during 1919 and the relatively higher prices for calf products in 1920.

Country slaughter of veal is proportionately much larger than for any other class of animals. The Federally-inspected slaughter of calves in 1909 was about one-third of the total slaughter; and, although it is increasing, it is estimated to be still well below one-half of the total.

The consumption of veal corresponds to the production, as there are no imports or exports recorded. The per capita consumption for the whole period has averaged close to 7 pounds per annum. It was lowest in 1915 (4.3 pounds) and highest in 1920 (8.5 pounds).

1920	556	428	128	4	101	653	[illegible]

The production and consumption of mutton and lamb is very small in comparison with beef and pork. It averages only about one-tenth of beef and one-twelfth of pork. The table shows the production of mutton and lamb to have been greatest from 1911 to 1914, in each of which years it exceeded 700,000,000 pounds. The year of lowest production was 1917, when the yield was only 473,000,000 pounds. Since 1917 the trend was upward for two years but declined again in 1920.

The proportion of Federal-inspected slaughter is greater with sheep and lambs than with any other class of live stock. Nearly four-fifths of the total mutton and lamb produced is inspected in establishments having Government supervision.

Normally, there is very little foreign trade in mutton or lamb, but last year saw a new departure in heavy imports of Australasian product. These imports amounted to nearly one-fifth of the total production.

The table shows the per capita consumption ranging between 8.2 pounds (highest) in 1912 and 4.7 pounds (lowest) in 1917. There has been a steady rise in the last three years.

Estimated annual production, exports, imports, and consumption of pork and lard in United States.

PORK.

It is well known that the hog industry is subject to rather violent changes due to the economic situation and the character of the corn crop in a given year. This is illustrated in the tables, in which it may be seen there are three lean years, viz, 1909, 1910, and 1917. The shortage in 1909 and 1910 was due to the failure of the corn crop, and that of 1917 is attributed to overmarketing, including breeding stock, in the preceding year, due mostly to the attraction of high war prices. The enormous productions in 1918 and 1919 evidence a remarkable recovery, which would have been impossible with any other class of live stock than the prolific and quick-maturing hog. The production in 1920 probably suffered somewhat from the heavy marketings of the previous year.

The exports of pork products, excluding lard, in 1920 indicate a return to normal proportions as compared with the enormous war-time shipments of the previous two years. The reversal was no doubt aided by the shorter production and by the international economic conditions.

Regarding the exports of lard, it may be noted that those of the war period did not exceed the prewar totals as did those of other pork products. Lard exports have been large for a long period of years; in fact, the American lard hog has never had a competitor in the world's markets. It is, nevertheless, rather surprising to note that the lard exports of 1911 to 1913 were larger even than those of the years from 1915 to 1918. This is explained by the fact that the Central Powers, especially Germany, as well as the continental European neutrals, were large consumers of our lard, and the loss of this trade affected the totals until 1919, when foreign shipments were the largest in history. The lard exports were very large also in 1920, although those of other products fell off fully 50 per cent.

The largest quantity of pork products consumed within a year occurred in 1916, and the next highest figures were in 1908 and 1918. The smallest consumption occurred in 1910 and 1917, in which years the production, as before stated, was much below normal. The per capita consumption was highest in 1908 and lowest in 1917. The difference between these two years shows the wide margin of 28 pounds, but it may be stated that the unusually low figure in 1917 was caused not only by the short production but also in large measure by the high prices and the need of conserving a scarce supply for export.

Estimated annual production, exports, imports, and consumption of all meats[1] (excluding lard) in United States.

[1] Includes small quantity of goat meat not given separately.

The figures in the table above are merely the addition of the various meats in the previous tables plus a small quantity of goat meat. The latter, however, furnishes only about one-tenth of a pound per capita of the total meat consumption in the country.

It may be seen from the last table that the banner year in meat production was 1918, when a little over 18,000,000,000 pounds were produced. Two-thirds of this meat was examined and certified as fit for human food by Federal inspectors. One-third, or 6,000,000,000 pounds, was subject to State or local inspection, or no inspection at all, and practically all of this was slaughtered and consumed within State boundaries. During the last two years the production has fallen off at the rate of about 1,000,000,000 pounds a year. But because of the decrease in exports there was little change in the consumption totals of 1919 and 1920.

NOTE.—Any conflict or disparity in the figures of the foregoing tables and those contained in Mr. Roberts's report doubtless arise from the different periods, i. e., whether the fiscal year or the calendar year is used, or the difference in the classes of animals or products. They all originate from the same source.

Sixth. Statements issued by the Bureau of the Census in June, 1921, show the number of cattle, swine, sheep, and goats on farms in the United States on January 1, 1920, as compared with April 15, 1910, as follows: These figures do not include a number of animals in village barns and elsewhere other than on farms which, as shown by the Bureau of the Census, numbered on January 1, 1920, 2,111,928 cattle and 1,220,564 dairy cows, and on April 15, 1910, 1,878,782 cattle and 1,170,338 dairy cows.

CATTLE ON FARMS IN THE UNITED STATES.

WASHINGTON, D. C., *June 8, 1921.*

The Bureau of the Census, of the Department of Commerce, announces, subject to correction, the following preliminary figures from the 1920 census of agriculture for the United States, with comparative figures for 1910:

Cattle on farms in the United States: 1920 and 1910.

'attle on farms Jan. 1, 1920, total number	66, 810, 836
Beef cattle, total	35, 424, 458
Calves under 1 year of age	8, 631, 631
Heifers 1 year old and under 2 years	3, 980, 343
Cows and heifers 2 years old and over	12, 644, 018
Steers 1 year old and under 2 years	4, 697, 147
Steers 2 years old and over	4, 611, 763
Bulls 1 year old and over	777, 704
Unclassified	81, 852
Dairy cattle, total	31, 386, 378
Calves under 1 year of age	6, 904, 586
Heifers 1 year old and under 2 years	4, 057, 644
Cows and heifers 2 years old and over	19, 671, 777
Bulls 1 year old and over	752, 371
ittle on farms Apr. 15, 1910, total number	61, 803, 866
Spring calves	7, 806, 539
Cattle born before Jan. 1, 1910	53, 997, 327

The number of cattle on farms in the United States on January 1, 1920, cording to the Fourteenth Census, was 66,810,836. This number included ,424,458 beef cattle (cattle kept mainly for beef production) and 31,386,378 iry cattle (cattle kept mainly for milk production).

BEEF AND DAIRY CATTLE.

The beef cattle included 8,631,631 calves under 1 year of age, 3,980,343 year-g heifers, 12,644,018 cows and heifers 2 years old and over, 4,697,147 yearling ers, 4,611,763 steers 2 years old and over, 777,704 bulls 1 year old and over, d 81,852 cattle not classified by age or sex.

The dairy cattle included 6,904,586 calves under 1 year of age, 4,057,644 arling heifers, 19,671,777 cows and heifers 2 years old and over, and 752,371 lls 1 year old and over.

COMPARISON WITH 1910.

The number of cattle reported at the census of 1910 was 61,803,866, but the nge in the date of enumeration, from April 15 in 1910 to January 1 in 1920, ist be taken into account in making any comparisons between the two years. e 1920 census, taken as of January 1, was too early to include any spring ves, while the 1910 census, taken as of April 15, included 7,806,539 calves rn between January 1 and April 15, 1910, or probably more than one-half of calves born in the spring of that year. On the other hand, the cattle umerated as of January 1, 1920, included large numbers of animals destined be slaughtered or marketed before April 15.

The relative importance of these two factors resulting from the change in the te of enumeration varies from State to State. In some States the number of ves born in the first three and one-half months of the year would greatly ved the number of cattle slaughtered or sent to market, while in other ites the number of cattle slaughtered during this period might almost offset number of calves born.

For the United States as a whole, the total number of cattle reported for 20 exceeds the total number in 1910 by 5,006,970. The actual increase, after allowance has been made for the effects of the change in date of enumera-n, is doubtless more than this, but less than the difference between the mber of cattle in 1910, excluding spring calves, and the number of cattle in 20.

STATES RANKING HIGHEST IN CATTLE.

Five States reported more than 3,000,000 cattle on farms for January 1, 20, as follows: Texas, 6,249,443; Iowa, 4,567,708; Nebraska, 3,167,279; Wis-sin, 3,050,829; and Minnesota 3,021,469. The States reporting the largest mbers of dairy cows 2 years old and over were Wisconsin with 1,795,122; w York, with 1,481,918; and Minnesota, with 1,229,179, no other State re-rting as many as 1,000,000 dairy cows 2 years old and over.

Number of cattle on farms in the United States, by geographic divisions and States: 1920 and 1910.

[1] The United States total includes 81,852 cattle not classified by age or sex. This number is distributed by States as follows: South Dakota, 8,563; Nebraska, 2,612; Florida, 39,500; Texas, 2,006; Montana, 23,518; Idaho 2,328; and Arizona, 3,325.

Swine on Farms in the United States.

Washington, D. C., *June 4, 1921.*

The Bureau of the Census of the Department of Commerce announces, subject to correction, the following preliminary figures from the 1920 census of agriculture for the United States, with comparative figures for 1910:

Swine on farms in the United States, 1920 and 1910.

Swine on farms Jan. 1, 1920, total number	59,368,167
Pigs under 6 months old	26,237,924
Sows and gilts for breeding, 6 months old and over	11,445,239
Boars for breeding, 6 months old and over	934,553
All other hogs, 6 months old and over	20,750,451
Swine on farms Apr. 15, 1910	58,185,676

The number of swine on farms in the United States on January 1, 1920, according to the Fourteenth Census, was 59,368,167. This number includes 26,237,924 pigs under 6 months old on that date, 11,445,239 sows and gilts 6 months old and over kept for breeding purposes, 934,553 boars kept for breeding purposes, and 20,750,451 other hogs 6 months old and over.

The number of swine reported at the 1910 census was 58,185,676, but the change in the date of enumeration from April 15 in 1910 to January 1 in 1920 must be taken into consideration in making any comparisons between the two years. The 1920 census, taken in January, was too early to include any spring pigs, while the 1910 census, taken in April (beginning Apr. 15), probably included more than half of the "crop" of spring pigs. On the other hand, a farm census taken in January would include large numbers of hogs destined for sale or slaughter before April 15.

The relative importance of these two factors resulting from the change in the date of enumeration varies from State to State. In those States where the number of pigs born in the first three and a half months of the year is greater than the number of hogs slaughtered or marketed, the 1910 figures, relating to April 15, are too large for a fair comparison with the number of swine on hand January 1, 1920—as much too large as the number of pigs born between January 1 and April 15 exceeds the number of hogs sold or slaughtered during the same period. On the other hand, if in any State the number of swine slaughtered or sent to market between January 1 and April 15 were greater than the number of pigs born during the same period, the 1910 figures would be too small for a fair comparison with the 1920 figures.

Arranging the States in order of the number of hogs and pigs reported, it appears that the following States stood at the head of the list (and in the same order) both in 1920 and in 1910: Iowa, with 7,864,304 swine on farms in 1920; Illinois, with 4,640,447; Missouri, with 3,888,677; Indiana, with 3,757,135; Nebraska, with 3,441,917; and Ohio, with 3,083,846. These six States are the only ones which reported more than 3,000,000 swine in 1920.

Kansas ranked seventh in 1910, but showed a decided falling off in 1920. This was accompanied by a marked decrease in the acreage and production of corn and a corresponding increase in wheat and oats, and doubtless indicates a change in type of farming. A similar situation prevails in Oklahoma, which also shows a considerable decrease in the number of swine reported for 1920 as compared with 1910. Most of the Mountain States, on the other hand, show a decided increase in the number of hogs on farms.

Number of swine on farms in the United States, by geographic divisions and States 1920 and 1910.

Division or State.	Swine on farms Jan. 1, 1920. Total.	Pigs under 6 months old.	Sows and gilts for breeding, 6 months old and over.	Boars for breeding, 6 months old and over.	All other hogs, 6 months old and over.	Swine on farms Apr. 15, 1910.

SHEEP AND GOATS ON FARMS IN THE UNITED STATES.

WASHINGTON, D. C., *June 15, 1921.*

The Bureau of the Census, of the Department of Commerce, announ[illegible] subject to correction, the following preliminary figures from the 1920 censu[illegible] of agriculture for the United States, with comparative figures for 1910.

Sheep and goats on farms in the United States, 1920 and 1910.

Sheep on farms Jan. 1, 1920, total number	34,984,5[illegible]
Lambs under 1 year of age	8,931,70[illegible]
Ewes 1 year old and over	23,462,6[illegible]
Rams 1 year old and over	826,37[illegible]
Wethers 1 year old and over	1,494,0[illegible]
Unclassified	269,7[illegible]
Sheep on farms Apr. 15, 1910, total number	52,447,8[illegible]
Spring lambs	12,803,8[illegible]
Sheep born before Jan. 1, 1910	39,644,0[illegible]
Goats on farms Jan. 1, 1920, total number	3,42[illegible]
Kids under 1 year of age, raised for fleeces	[illegible]
Goats 1 year old and over, raised for fleeces	1,56[illegible]
All other goats	1,32[illegible]
Goats on farms Apr. 15, 1910	2,915,1[illegible]

The number of sheep on farms in the United States on January 1, 19[illegible] according to the Fourteenth Census, was 34,984,524. The number incl[illegible] 8,931,705 lambs under 1 year of age, 23,462,689 ewes 1 year old and o[illegible] 826,373 rams 1 year old and over, and 1,494,032 wethers 1 year old and over[illegible]

The number of goats reported for the same date was 3,426,506, includin[illegible] 530,763 kids under 1 year of age, raised for fleeces, 1,569,834 goats 1 year [illegible] age and over, raised for fleeces, and 1,325,909 other goats—goats and kid[illegible] all ages not kept for their fleeces.

COMPARISON WITH 1910.

The number of sheep reported at the census of 1910 was 52,447,861, but t[illegible] change in the date of enumeration from April 15 in 1910 to January 1 in 19[illegible] must be taken into account in making any comparisons between the two y[illegible] The 1920 census, taken as of January 1, was too early to include any sp[illegible] lambs, while the 1910 census, taken as of April 15, included 12,803,81[illegible] born between January 1 and April 15, 1910. On the other hand, the [illegible] enumerated as of January 1, 1920, included large numbers of animals de[illegible] to be slaughtered or marketed before April 15.

The relative importance of these two factors resulting from the change [illegible] the date of enumeration varies from State to State. In some States the nu[illegible] of lambs born during the first three and one-half months of the year w[illegible] greatly exceed the number of sheep and older lambs slaughtered or se[illegible] market, while in other States the number of sheep slaughtered during [illegible] period might almost offset the number of lambs born.

Taking as a basis of comparison the sheep reported in 1910, exclus[illegible] spring lambs, the figures for the United States as a whole show a decre[illegible] 4,659,522 sheep between 1910 and 1920. The actual decrease, however, a[illegible] due allowance has been made for sheep slaughtered as well as for sp[illegible] lambs, is considerably more than this, but less than the difference betw[illegible] the total number of sheep reported in 1910 and the number in 1920.

The total number of goats reported at the 1910 census was 2,915,12[illegible] compared with this figure, the number of goats reported for 1920 repre[illegible] a nominal increase of 511,381. The actual increase, after making allow[illegible] for the change in date of enumeration, is doubtless considerably less than [illegible]

RANK OF IMPORTANT STATES.

Six States reported more than 2,000,000 sheep on farms for January 1, [illegible] as follows: Texas, 2,552,412; California, 2,400,151; Idaho, 2,356,27[illegible]; [illegible] 2,102,550; Montana, 2,082,919; and Oregon, 2,002,378.

The States reporting the largest numbers of goats were Texas, with 1,[illegible] New Mexico, with 226,862; Arizona, with 161,124; Oregon, with 13[illegible] [illegible]kansas, with 123,800; Missouri, with 121,012; and California, with 11[illegible] These seven States are also among those reporting the largest number[illegible] goats kept for fleeces.

Division or State.	Sheep on farms Jan. 1, 1920. Total.[1]	Lambs under 1 year of age.	Ewes 1 year old and over.	Rams 1 year old and over.	Wethers 1 year old and over.	Sheep on farms Apr. 15, 1910.	Goats on farms Jan. 1, 1920. Total.	Kids under 1 year of age, raised for fleeces.	Goats 1 year old and over, raised for fleeces.	All other goats.	Goats on farms Apr. 15, 1910.

An examination of the Statistical Abstract of the United States and of the reports of the Bureau of Markets from time to time will show that the estimates that are made of the number each year between census periods are generally excessive and necessarily are mere estimates. The most accurate figures, therefore, are those issued by the Bureau of the Census. Any deductions drawn from the estimates of the Bureau of Markets from the years closest to the census dates should at least be modified accordingly. The estimates are doubtless the best that can be made from the data obtainable, and what I say is not said in a spirit of criticism, but merely to point out the fact.

The figures obtained from the markets as to the number inspected at the slaughtering establishments under Government inspection afford the best barometer of the live-stock supply converted into meat.

Seventh. I submit herewith a statement taken from the Interstate Commerce Commission's summary of freight commodities statistics of Class I roads for the quarter ended March 31, 1921, showing the revenue freight originating and the revenue freight carried in the western district by Class I roads, by number of carloads and the number of tons of the different commodities. As explained, this shows the importance of the live-stock business. It should be stated in this connection that the ton-miles are not given, because this record is not now kept in the reports given to the Interstate Commerce Commission. The statement does not therefore show the relative services performed, which, by reason of the longer distance movement of live stock than the average, is greater than the relative number of tons and carloads.

As stated by me in oral argument, the agricultural producer always pays the freight on his articles deducted from the account sales, and all of the commodities which move to him as a matter of common knowledge come with the freight added. This table will enable one to observe, therefore, the quantities that are moved where the freight is added and which the consumer has to pay. This would include agricultural implements, vehicles, and all of the other commodities which the farmer consumes. From this it results that the increased rate of freight during and since the war is a double burden upon agriculture. The statement is as follows:

Summary of freight commodity statistics of Class I roads for the quarter ended Mar. 31, 1921.

[Class I roads are those having annual operating revenues above $1,000,000, western district; average number of miles of road operated, 131,751.81.]

[illegible]—Calfskins were not reported separately during this period of years, but were included in "All [illegible] hides and skins."

Mr. Cowan. During the calendar year which ended with the 31st December last the total importation of hides and skins of all kinds, [illegible]clusive of furs, was 700,107,000 pounds. The domestic production [illegible]ring the same period was 849,530,000 pounds. The figures include [illegible]es and skins of cattle, horses, sheep, goats, buffalo, kangaroo, [illegible]llaby, and all other animals from whose outer coverings leather is [illegible]de. The aggregate of cattle and calf skins produced in this coun[illegible] and included in the above, was 789,630,000 pounds, and the [illegible]portations 386,510,000. The figures are taken from Commerce [illegible]ports, issue of October 24, page 443.

In spite of the fact that during the current year the demand for [illegible]es in the tanneries of the United States reached such a low point [illegible] during several weeks the value of the hides taken off the steers [illegible] the ranges was less than the freight charges to market them, the [illegible]e publication tells us that—

> [illegible]n increase of 22.1 per cent over the quantity recorded last year marked the August, [illegible] imports of cattle hides into the United States. Argentina supplied 32.2 per [illegible] of the month's purchases, Uruguay 21.9 per cent, Brazil 12.5 per cent, Canada [illegible] per cent, Cuba 7.7 per cent, and all other countries 16.4 per cent.

[illegible]t will be noted that 66.6 per cent of the total importation of cattle [illegible]es during the month of August (and approximately the same [illegible]centage will apply throughout the year) came from Argentina, [illegible]guay, and Brazil, or "the River Plate country."

The manufacturers of shoes and the tanners, through their propa-ganda and their lobbyists, insist that a duty on hides will materially help the packer, but that the stockman and the farmer will receive no benefit whatever.

Just what proportion of the hides imported during the month of August were produced in the plants of the American packers doing business in South America it is impossible to ascertain. That the American-owned hides of South American production are brought into the United States is not denied. If the packer-owner of the South American plants controls 60 per cent of the foreign imports why should he worry? Free hides from South America, produced in his own packing establishments, combined with the control of the hide markets of this country, if the packer really does control those markets, appears to give a practical monopoly.

The argument that the farmer will secure no benefit whatever from the imposition of a duty on hides is the assertion, and the assertion only, of interested manufacturers. They are able, through their control of practically unlimited funds with which to distribut propaganda in support of their claims for preference in the matt of what they insist upon calling "raw material." The farmers an cattle raisers are unable to meet this propaganda except as they com before Congress to point out that the "raw material" of their plan is the sweat of their brows and the elasticity of their muscles. It the plow and the harrow, the scythe and the pitchfork, which repr sent "raw material" for the production of the animal which gro the hide that is the "raw material" of the gentlemen who wa "free raw material" in order that they may add still greater pro to those which they have piled up since hides were placed on t free list, by doubling the price of the harness which the farmer nee to produce the "raw material" for the shoes which he must we and which cost him twice as much as they did before Congre removed the duty on hides.

From Commerce Reports for November 7, 1921, I take the lat figures on the importation of hides. The committee will note th during the month of September 64 per cent of the imports of cat hides were from Argentina and Brazil, where the American pack so nearly controls the export.

UNITED STATES IMPORTS OF HIDES AND SKINS.

There was a total of 32,805,587 pounds of various kinds of hides and skins imp into the United States during September, 1921; in August the aggregate had 38,090,047 pounds. Cattle hides represented 49.8 per cent of the month's ar (40.6 per cent in August); goatskins, 20.6 per cent (26.5 per cent in August); calfsk 16.5 per cent (15.4 per cent in August); sheepskins, 9.8 per cent (14.9 per ce August); other hides and skins, 3.3 per cent (2.6 per cent in August).

The September, 1920 and 1921, imports of hides and skins show little varia the total number of pounds. However, only 1,790,955 pounds of calfskin imported during September, 1920, and in the same month of this year 5,4 pounds, an increase of 203 per cent. Dry calfskin imports rose from 576,596 poun 1,611,541 pounds, and the green or pickled from 1,214,359 pounds to 3,815,176 p Goatskin imports likewise were more than double those for September of last the gain applying to dry as well as to green or pickled skins.

The percentage of the August and September, 1921, imports received from each of the principal countries supplying hides and skins to the United States was:

Imports of hides and skins.

Countries of origin.	August.	September.	Countries of origin.	August.	September.
Cattle hides:	*Per cent.*	*Per cent.*	Calfskins:	*Per cent.*	*Per cent.*
Argentina	32.2	44.6	France	21.1	25.5

Other countries	26.2	28.2	Other countries	6.8	21.0

Mr. Cowan. I will undertake to make the statement that throughout the western half of the United States—without exception—the farmers and stock raisers and, of course, the poultry raisers, who are all the same people, can not prosper without relief that can be granted only through acts of Congress. They can not stand foreign competition from countries in South America or with China, for that matter, nor India, on these farm products that can be shipped to our shores even if we can ship ours across the United States.

A protective tariff is almost worthless unless we can get transportation for our own products, and we have got to come to a common level so that it is a live and let live policy. We are perfectly willing, as the gentleman said who spoke of eggs, to pay our part of the duty on manufactured articles so far as that goes. It is amazing to me that we could even stop to consider what a tariff would add to the cost of agricultural products not manufactured and shipped, and yet that such a tariff would not add to the cost of shoes, harness, and saddles. We will make them here, and we will raise the stuff from which to make them.

The neighborhood that lives off of its own products is the most prosperous neighborhood. I was born and raised in Tennessee. If we were put to it, we could live there actually upon our own resources—our own labor and work. The Nation is safe when it can do that; and every agricultural interest in this country ought to be so prosperous that all the available lands in this country can be put under cultivation. Labor needs a place to get out and live and stop the concentration of people in these vast cities; and that is the danger point in this country. Only last Sunday Mr. Spiller and I rode through the East Side of New York City. We saw the hundreds of thousands of people who can not read the English language. As we remarked, they doubtless did not know that there was such a place as Grant's Tomb, and perhaps they did not know of the Commodore Hotel; they certainly did not know anything about the policies and principles of government of this country.

But the people on the farms of that same class and nationality who live out in the West, those who populated that country, have become good citizens. With the fostering of agriculture that is the
